Switch Engine™ Command Reference Guide

for Version 32.2

9037559-00 Rev AA
September 2022

Legal Notice

Extreme Networks, Inc. reserves the right to make changes in specifications and other information contained in this document and its website without prior notice. The reader should in all cases consult representatives of Extreme Networks to determine whether any such changes have been made.

The hardware, firmware, software or any specifications described or referred to in this document are subject to change without notice.

Trademarks

Extreme Networks and the Extreme Networks logo are trademarks or registered trademarks of Extreme Networks, Inc. in the United States and/or other countries.

All other names (including any product names) mentioned in this document are the property of their respective owners and may be trademarks or registered trademarks of their respective companies/owners.

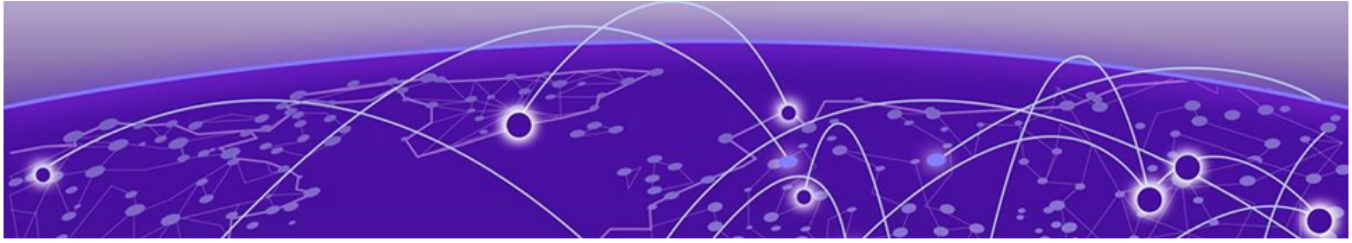
Open Source Declarations

Some software files have been licensed under certain open source or third-party licenses. End-user license agreements and open source declarations can be found at: https://www.extremenetworks.com/support/policies/open-source-declaration/



Introduction to the Switch Engine™ Command Reference

This guide is intended for use by network administrators who are responsible for installing and setting up network equipment. In addition to comprehensive conceptual information about each feature of our software, you will also find detailed configuration material, helpful examples, and troubleshooting information. Also included are supported platforms and recommended best practices for optimal software performance.

Important
Release 31.6 introduced new names for the network operating systems running on Universal hardware. ExtremeXOS (EXOS) was renamed to Switch Engine and VSP Operating System Software (VOSS) was renamed to Fabric Engine. All references to ExtremeXOS apply to Switch Engine 31.6 and later.

Note
If the information in the release notes shipped with your switch differs from the information in this guide, follow the release notes.

Conventions

To help you better understand the information presented in this guide, the following topics describe the formatting conventions used for notes, text, and other elements.

Send Feedback

The Information Development team at Extreme Networks has made every effort to ensure that this document is accurate, complete, and easy to use. We strive to improve our documentation to help you in your work, so we want to hear from you. We welcome all feedback, but we especially want to know about:

- Content errors, or confusing or conflicting information.
- Improvements that would help you find relevant information.
- Broken links or usability issues.

To send feedback, do either of the following:

- Access the feedback form at https://www.extremenetworks.com/documentation-feedback/.
- Email us at documentation@extremenetworks.com.

Provide the publication title, part number, and as much detail as possible, including the topic heading and page number if applicable, as well as your suggestions for improvement.

Help and Support

If you require assistance, contact Extreme Networks using one of the following methods:

Extreme Portal

Search the GTAC (Global Technical Assistance Center) knowledge base; manage support cases and service contracts; download software; and obtain product licensing, training, and certifications.

The Hub

A forum for Extreme Networks customers to connect with one another, answer questions, and share ideas and feedback. This community is monitored by Extreme Networks employees, but is not intended to replace specific guidance from GTAC.

Call GTAC

For immediate support: (800) 998 2408 (toll-free in U.S. and Canada) or 1 (408) 579 2826. For the support phone number in your country, visit: www.extremenetworks.com/support/contact

Before contacting Extreme Networks for technical support, have the following information ready:

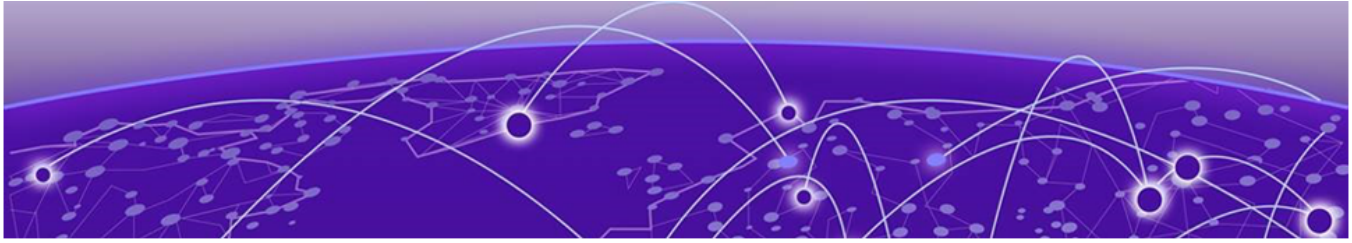
- Your Extreme Networks service contract number, or serial numbers for all involved Extreme Networks products
- A description of the failure
- A description of any actions already taken to resolve the problem
- A description of your network environment (such as layout, cable type, other relevant environmental information)
- Network load at the time of trouble (if known)
- The device history (for example, if you have returned the device before, or if this is a recurring problem)
- Any related RMA (Return Material Authorization) numbers

Subscribe to Product Announcements

You can subscribe to email notifications for product and software release announcements, Field Notices, and Vulnerability Notices.

1. Go to The Hub.
2. In the list of categories, expand the **Product Announcements** list.
3. Select a product for which you would like to receive notifications.
4. Select **Subscribe**.
5. To select additional products, return to the **Product Announcements** list and repeat steps 3 and 4.

You can modify your product selections or unsubscribe at any time.



Command Reference Overview

This guide provides details of the command syntax for all Switch Engine commands in this Switch Engine version.

The guide does not provide feature descriptions, explanations of the technologies, or configuration examples. For information about the various features and technologies supported by Extreme Networks switches, see *Switch Engine 32.2 User Guide*.

This chapter includes the following sections:

- Audience
- Structure of this Guide
- Understanding the Command Syntax
- Port Numbering
- Line-Editing Keys
- Command History

Audience

This guide is intended for use by network administrators who are responsible for installing and setting up network equipment.

It assumes a basic working knowledge of the following:

- Local area networks (LANs).
- Ethernet concepts.
- Ethernet switching and bridging concepts.
- Routing concepts.
- Internet Protocol (IP) concepts.

- Routing Information Protocol (RIP), Open Shortest Path First (OSPF), and Intermediate System-Intermediate System (IS-IS) concepts.
- Border Gateway Protocol (BGP-4) concepts.
- IP Multicast concepts.
- Protocol Independent Multicast (PIM) concepts.
- Simple Network Management Protocol (SNMP).

Structure of this Guide

This guide documents each Switch Engine command.

Related commands are grouped together and organized into chapters based on their most common usage. The chapters reflect the organization of *Switch Engine 32.2 User Guide*. If a specific command is relevant to a wide variety of functions and could be included in a number of different chapters, we have attempted to place the command in the most logical chapter. Within each chapter, commands appear in alphabetical order.

For each command, the following information is provided:

- Command Syntax—The actual syntax of the command. The syntax conventions (the use of braces, for example) are defined in the section Understanding the Command Syntax on page 9.
- Description—A brief (one sentence) summary of what the command does.
- Syntax Description—The definition of any keywords and options used in the command.
- Default—The defaults, if any, for this command. The default can be the default action of the command if optional arguments are not provided, or it can be the default state of the switch (such as for an enable/disable command).
- Usage Guidelines—Information to help you use the command. This may include prerequisites, prohibitions, and related commands, as well as other information.
- Example—Examples of the command usage, including output, if relevant.
- History—The version of Switch Engine in which the command was introduced, and version(s) where it was modified, if appropriate.
- Platform Availability—Platforms on which the command is available.

Product Overview

This table lists the Extreme Networks products that run the Switch Engine software.

Table 1: Switch Engine Switches

Switch Series	Switch Models
ExtremeSwitching 5320	5320-48T-8XE 5320-48P-8XE 5320-24T-8XE 5320-24P-8XE 5320-16P-4XE 5320-16P-4XE-DC
ExtremeSwitching 5420	5420F-8W-16P-4XE 5420F-24P-4XE 5420F-24S-4XE 5420F-24T-4XE 5420F-16MW-32P-4XE 5420F-16W-32P-4XE 5420F-48P-4XE 5420F-48P-4XL 5420F-48T-4XE 5420M-24T-4YE 5420M-24W-4YE 5420M-16MW-32P-4YE 5420M-48T-4YE 5420M-48W-4YE
ExtremeSwitching 5520	5520-24T 5520-24W 5520-48T 5520-48W 5520-12MW-36W 5520-24X 5520-48SE
ExtremeSwitching 5720	5720-24MW 5720-24MXW 5720-48MW 5720-48MXW

Software Required

Extreme Hardware/Software Compatibility and Recommendation Matrices lists the minimum Switch Engine software version required to support each ExtremeSwitching switch model.

Note

The features available on each switch are determined by the installed feature license and optional feature packs. For more information, see the *Feature License Requirements* document.

A SummitStack is a combination of up to eight Summit family switches that are connected together.

Understanding the Command Syntax

This section covers the following topics:

Access Levels

When entering a command at the prompt, ensure that you have the appropriate privilege level.

Most configuration commands require you to have the administrator privilege level.

Syntax Symbols

You may see a variety of symbols shown as part of the command syntax.

These symbols explain how to enter the command, and you do not type them as part of the command itself. The following table summarizes command syntax symbols.

Note
Switch Engine software does not support the ampersand (&), left angle bracket (<), or right angle bracket (>) because they are reserved characters with special meaning in XML.

Table 2: Command Syntax Symbols

Symbol	Description
square brackets [ ]	Enclose a required value or list of required arguments. One or more values or arguments can be specified. For example, in the syntax `use image [`**`primary`** `|` **`secondary`**`]` you must specify either the primary or secondary image when entering the command. Do not type the square brackets.
braces { }	Enclose an optional value or a list of optional arguments. One or more values or arguments can be specified. For example, in the syntax `reboot {`**`time`** *`month day year hour min sec`*`} {`**`cancel`**`} {`**`msm`***`slot_id`*`} {`**`slot`***`slot-number`* `|` **`node-address`***`node-address`* `|` **`stack-topology`** `{`**`as-standby`**`}}` you can specify either a particular date and time combination, or the keyword cancel to cancel a previously scheduled reboot. In this command, if you do not specify an argument, the command will prompt asking if you want to reboot the switch now. Do not type the braces.
vertical bar |	Separates mutually exclusive items in a list, one of which must be entered. For example, in the syntax `configure snmp community [`**`readonly`** `|` **`readwrite`**`]` *`alphanumeric_string`* you must specify either the read or write community string in the command. Do not type the vertical bar.

Syntax Helper

The CLI has a built-in syntax helper. If you are unsure of the complete syntax for a particular command, enter as much of the command as possible and press [Tab]. The syntax helper provides a list of options for the remainder of the command, and places the cursor at the end of the command you have entered so far, ready for the next option.

If the command is one where the next option is a named component, such as a VLAN, access profile, or route map, the syntax helper also lists any currently configured names that might be used as the next option. In situations where this list might be very long, the syntax helper lists only one line of names, followed by an ellipses (...) to indicate that there are more names than can be displayed.

Some values (such as the *node-address* used in Summit stack) are lengthy, but limited in number. Switch Engine places these values into a "namespace." This allows command completion on these values.

The syntax helper also provides assistance if you have entered an incorrect command.

Abbreviated Syntax

Abbreviated syntax is the shortest unambiguous allowable abbreviation of a command or parameter.

Typically, this is the first three letters of the command. If you do not enter enough letters to allow the switch to determine which command you mean, the syntax helper provides a list of the options based on the portion of the command you have entered.

Note

When using abbreviated syntax, you must enter enough characters to make the command unambiguous and distinguishable to the switch.

CLI File Name Completion

When entering a command, at the point where a file name could be entered, press **[Tab]** or **?** to display an alphabetically sorted list of possible file names. You can also type part of the file name to display a filtered list of file names matching what you have typed so far.

The following commands support this behavior:

- `cd directory_name`
- `configure access-list aclname [any | ports port_list | vlan vlan_name] {ingress | egress}`
- `configure ip-security dhcp-bindings storage filename name`
- `configure snmp access-profile [ access_profile {readonly | readwrite} | [[add rule ] [first | [[before | after] previous_rule]]] | delete rule | none ]`
- `configure ssh2 access-profile [ access_profile | [[add rule] [first | [[before | after] previous_rule]]] | delete rule | none]`
- `configure telnet access-profile [ access_profile | [[add rule ] [first | [[before | after] previous_rule]]] | delete rule | none ]`
- `configure vlan vlan_name udp-profile [profilename | none]`
- `cp old_name new_name`

- create process *name* executable *exe* {start [**auto** | **on-demand**]} {**node** *node*} {*vr vr-name*} {**description** *description*} {*arg1* {*arg2* { *arg3* { *arg4* { *arg5* { *arg6* { *arg7* { *arg8* { *arg9* }}}}}}}}}
- create process *name* **python-module** *python-module* {**start** [**auto** | **on-demand**]} {**node** *node*} {**vr** *vr-name*} {**description** *description*} {*arg1* {*arg2* {*arg3* {*arg4* {*arg5* {*arg6* {*arg7* {*arg8* {*arg9*}}}}}}}}}
- edit policy *filename*
- enable license file *filename*
- enable ssh2 {**access-profile** [*access_profile* | **none**]} {**port** *tcp_port_number*} {**vr** [*vr_name* | **all** | **default**]}
- load script *filename* {**arg1**} {**arg2**} ... {**arg9**}
- ls *file_name*
- mkdir *directory_name*
- mv *old_name new_name*
- scp2 {**cipher** *cipher*} {**mac** *mac*} {**compression** [**on** | **off**]} {**port** *portnum*} {**vr** *vr_name*} *user* [*hostname* | *ipaddress*]:*remote_file local_file*
- show ssl {[**trusted-ca** | **ocsp-signature-ca**] [*file_name* | **all**]} {**manufacturing**}{**certificate** | **detail**}
- tftp [**ip-address** | **host-name**] { **-v** *vr_name* } { **-b** *block_size* } [**-g** | **-p**] [**-l** *local-file* { **-r** *remote-file* } | **-r** *remote-file* { **-l** *local-file* }]
- tftp get [**ip-address** | **host-name**] { **vr** *vr_name* } { **block-size** *block_size* } *remote-file local-file*} {**force-overwrite**}
- tftp put [*ip-address* | *host-name*] {**vr** *vr_name*} {**block-size** *block_size*}*local-file* { *remote-file*}
- rm *file_name*
- rmdir *directory_name*
- run script *filename* {**arg1**} {**arg2**} ... {**arg9**}
- unconfigure ssl certificate [**trusted-ca** | **ocsp-signature-ca**] [*file_name* | **all**]

Object Names

All named components within a category of the switch configuration, such as *VLAN (Virtual LAN)*, must be given a unique object name.

Object names must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but they cannot contain spaces. The maximum allowed length for a name is 32 characters.

Object names can be reused across categories (for example, *STPD (Spanning Tree Domain)* and VLAN names). If the software encounters any ambiguity in the components within your command, it generates a message requesting that you clarify the object you specified.

Note

If you use the same name across categories, Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Reserved Keywords

Keywords such as vlan, *STP (Spanning Tree Protocol)*, and other 2nd level keywords, are determined to be reserved keywords and cannot be used as object names. This restriction applies to the specific word (vlan) only, while expanded versions (vlan2) can be used.

A complete list of the reserved keywords for Switch Engine is found in the "Reserved Keywords" section of the *Switch Engine 32.2 User Guide*. Any keyword that is not on this list can be used as an object name.

Command Shortcuts

Components are typically named using the `create` command.

When you enter a command to configure a named component, you do not need to use the keyword of the component. For example, to create a *VLAN*, enter a VLAN name:

```
create vlan engineering
```

Once you have created the VLAN with a unique name, you can then eliminate the keyword **vlan** from all other commands that require the name to be entered (unless you used the same name for another category such as *STPD* or *EAPS (Extreme Automatic Protection Switching)*).

For example, instead of entering the command:

```
configure vlan engineering delete port 1:3,4:6
```

you could enter the following shortcut:

```
configure engineering delete port 1:3,4:6
```

Port Numbering

Commands that require you to enter one or more port numbers use the parameter *port_list* in the syntax.

The available variables differ on a stand-alone switch and SummitStack.

Note

The keyword all acts on all possible ports; it continues on all ports even if one port in the sequence fails.

Stand-alone Switch Numerical Ranges

On ExtremeSwitching switches, the port number is simply noted by the physical port number.

Separate the port numbers by a dash to enter a range of contiguous numbers, and separate the numbers by a comma to enter a range of non-contiguous numbers:

- x-y—Specifies a contiguous series of ports on a stand-alone switch.
- x,y—Specifies a non-contiguous series of ports on a stand-alone switch.
- x-y,a,d—Specifies a contiguous series of ports and a non-contiguous series of ports on a stand-alone switch.
- Port:Channel—For ExtremeSwitching 5720 channelized ports. For example, 49:4 maps to Port 49, Channel 4.

SummitStack Numerical Ranges

On SummitStack switches, the port number is a combination of the slot number and the port number.

The nomenclature for the port number is as follows: `slot:port`

For example, if there is a switch in slot 2 of the stack with a total of four ports, the following ports are valid:

- 2:1
- 2:2
- 2:3
- 2:4

You can also use wildcard combinations (*) to specify port combinations.

The following wildcard combinations are allowed:

- slot:*—Specifies all ports on a particular switch in the stack.
- slot:x-slot:y—Specifies a contiguous series of ports on a range of switches in the stack.
- slot:x-y—Specifies a contiguous series of ports on a particular switch in the stack.
- slota:x-slotb:y—Specifies a contiguous series of ports on a SummitStack node and end on another node.
- Slot:Port:Channel—For ExtremeSwitching 5720 channelized ports. For example, 2:49:4 maps to Slot 2, Port 49, Channel 4.

Line-Editing Keys

Table 3 describes the line-editing keys available using the CLI.

Table 3: Line-Editing Keys

Key(s)	Description
Left arrow or [Ctrl] + B	Moves the cursor one character to the left.
Right arrow or [Ctrl] + F	Moves the cursor one character to the right.
[Ctrl] + H or Backspace	Deletes character to left of cursor and shifts remainder of line to left.

Table 3: Line-Editing Keys (continued)

Key(s)	Description
Delete or [Ctrl] + D	Deletes character under cursor and shifts remainder of line to left.
[Ctrl] + K	Deletes characters from under cursor to end of line.
Insert	Toggles on and off. When toggled on, inserts text and shifts previous text to right.
[Ctrl] + A	Moves cursor to first character in line.
[Ctrl] + E	Moves cursor to last character in line.
[Ctrl] + L	Clears screen and movers cursor to beginning of line.
[Ctrl] + P or Up Arrow	Displays previous command in command history buffer and places cursor at end of command.
[Ctrl] + N or Down Arrow	Displays next command in command history buffer and places cursor at end of command.
[Ctrl] + U	Clears all characters typed from cursor to beginning of line.
[Ctrl] + W	Deletes previous word.
[Ctrl] + C	Interrupts the current CLI command execution.

Command History

The operating system "remembers" all the commands you enter.

You can display a list of these commands by using the following command:

```
history
```

If you use a command more than once, consecutively, the history will list only the first instance.

Extreme Networks PoE Devices

Following is a list of the Extreme Networks devices that support PoE+ and PoE++ and the minimum required software:

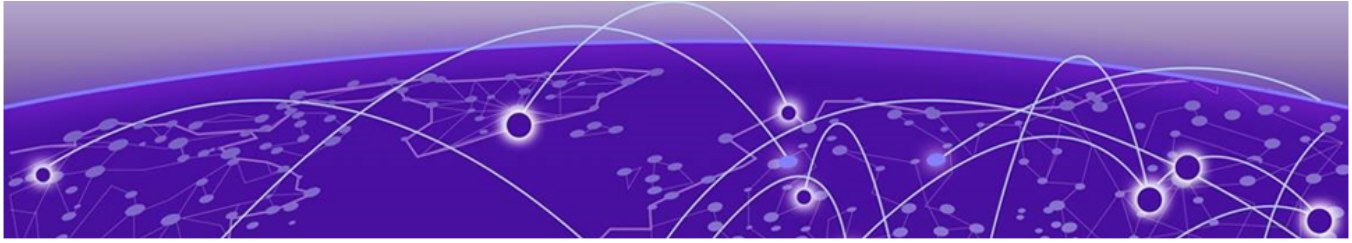
PoE+

- ExtremeSwitching 5420F-8W-16P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-24P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-16MW-32P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-16W-32P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-48P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-48P-4XL—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420M-16MW-32P-4YE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5320-48P-8XE—ExtremeXOS 31.6 and later.
- ExtremeSwitching 5320-24P-8XE—ExtremeXOS 31.6 and later.

- ExtremeSwitching 5320-16P-4XE—ExtremeXOS 31.7 and later.
- ExtremeSwitching 5320-16P-4XE-DC—ExtremeXOS 31.7 and later.

PoE++

- ExtremeSwitching 5520-24W—ExtremeXOS 31.1 and later.
- ExtremeSwitching 5520-48W—ExtremeXOS 31.1 and later.
- ExtremeSwitching 5520-12MW-36W—ExtremeXOS 31.1 and later.
- ExtremeSwitching 5420F-8W-16P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-16MW-32P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420F-16W-32P-4XE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420M-24W-4YE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420M-16MW-32P-4YE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5420M-48W-4YE—ExtremeXOS 31.3 and later.
- ExtremeSwitching 5720-24MW—Switch Engine 32.1 and later.
- ExtremeSwitching 5720-24MXW—Switch Engine 32.1 and later.
- ExtremeSwitching 5720-48MW—Switch Engine 32.1 and later.
- ExtremeSwitching 5720-48MXW—Switch Engine 32.1 and later.



Commands

The following section explains the operating system commands.

alias

```
alias alias_name command
```

Description

Creates aliases to execute any ExtremeXOS command, including any options, arguments, and redirection.

Syntax Description

alias_name	Specifies an alias name for the command.
command	ExtremeXOS command that you are creating an alias for.

Default

N/A

Usage Guidelines

To be recognized, the alias must be the first word in the string typed at the shell prompt. Substitution does not occur if the alias name string occurs anywhere else. Aliases are only recognized by the EXSH shell session in which they are created.

Executing the command `alias` (with no other arguments) displays a list of current aliases. Executing the command `alias` *`alias_name`* displays the command that will be substituted for *`alias_name`*.

To delete aliases, use the command unalias on page 3376.

After an alias has been created, you can auto-complete the alias name or display possible aliases along with regular commands by pressing the **TAB** key. You can tab-complete arguments that follow commands corresponding to an alias.

Creating an alias using the name of an existing ExtremeXOS command overrides the original meaning of that command. For example, executing `alias download "download image 102.3.10.5"` allows you to simply type `download` *`image_name`* to download your ExtremeXOS image from the 102.3.10.5 location . However, if you then want to download a bootrom file, the command `download` **`bootrom`** `102.3.10.5`*`filename`* no longer functions correctly. Such an alias can be disabled temporarily and the original command behavior restored by preceding it directly (with no spaces in between) with a backslash, `\download` **`bootrom`** `102.3.10.5`*`filename`* This temporarily overrides the alias definition and uses the original command.

To create an alias for a command that contains quoted strings within it, use a backslash. For example, if creating an alias "cr" for the command `configure vlan default description "This is the default VLAN"`, use the command `alias cr "configure vlan default description \"This is the default VLAN\""`.

The following limitations apply to aliases:

- Arguments cannot occur in the middle of alias commands. For example, you cannot create an alias "set_vlan_ip" for the command `configure` **`vlan`** *`vlan_name`* **`ipaddress`** *`ip_address`* where you specify the VLAN name as an argument. This is because aliases work through direct textual substitution.
- Aliases cannot be chained together. For example, if you create an alias "sh" for `show version` and another alias "ps" for `process`, then entering `sh ps` at the prompt is not equivalent to entering "`show version process`".
- You cannot tab-complete commands while trying to create an alias using the `alias` command.
- Aliases cannot be created for the current shell session using UPM scripts or Python scripts.

Aliases are only available in the shell session in which they are created. When you exit the shell your aliases are lost. To create persistent aliases, you need to add the aliases to the script `exshrc.xsf` that you must create using the VI editor and save in the `/usr/local/cfg` folder.

Example

The following example creates an alias named "set" for `configure` commands:

```
alias set "configure"
```

You can now substitute the command `set` for all `configure` commands. For example, you can type `set vlan` *`vlan_name`* **`tag`** *`tag`* instead of `configure vlan` *`vlan_name`* **`tag`** *`tag`*.

The following example creates an alias named "mycmd" to substitute for the `configure policy profile` command with the following arguments:

```
alias mycmd "configure policy profile 1 name Extreme pvid 1000 pvid-status enable tci-overwrite enable auth-override enable forbidden-vlans 2 cos-status enable cos 2 untagged-vlans 2 egress-vlans 200"
```

Typing `mycmd` now executes the command `configure policy profile 1 name Extreme pvid 1000 pvid-status enable tci-overwrite enable auth-override enable forbidden-vlans 2 cos-status enable cos 2 untagged-vlans 2 egress-vlans 200`

The following example lists all current aliases:

```
alias
alias mycmd='configure policy profile 1 name Extreme pvid 1000 pvid-status enable tci-overwrite enable auth-override enable forbidden-vlans 2 cos-status enable cos 2 untagged-vlans 2 egress-vlans 200'
alias set='configure'
```

History

This command was first available in ExtremeXOS 22.3

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

cat

```
cat {--number | -n } {--number-nonblank | -b } {--show-ends | -E } {--
   show-tabs | -T } {--show-nonprinting | -v }
```

Description

Displays the contents of various text files that may be created, edited, or otherwise visible in the user-visible file system.

Syntax Description

--number	Specifies that all output lines are numbered.
-n	Specifies that all output lines are numbered (same as **--number**).
--number-nonblank	Specifies that nonempty lines be numbers (overrides **--number**).
-b	Specifies that nonempty lines be numbers (same as **--number-nonblank**).
--show-ends	Displays $ at the end of each line.
-E	Displays $ at the end of each line (same as **--show-ends**).
--show-nonprinting	Specifies to use ^ and M- notation, except for LF and TAB.

-v	Specifies to use ^ and M- notation, except for LF and TAB (same as **--show-nonprinting**).
--show-tabs	Displays TAB characters as ^I.
-T	Displays TAB characters as ^I (same as **--show-tabs**).

Default

N/A

Usage Guidelines

Example files include ExtremeXOS shell script (.xsf), Python (.py), policy (.pol), license (.lic), and logging (.log) files.

There is no restriction on the type of file to be displayed.

CLI paging is effective for this command, but output filtering is not.

Example

The following example displays all options and filetypes for this command:

```
# cat ?
  --number            Number all output lines
  --number-nonblank   Number nonempty output lines (overrides --number)
  --show-ends         Display $ at end of each line
  --show-nonprinting  Use ^ and M- notation, except for LF and TAB
  --show-tabs         Display TAB characters as ^I
  -E                  Display $ at end of each line (same as --show-ends)
  -T                  Display TAB characters as ^I (same as --show-tabs)
  -b                  Number nonempty output lines (same as --number-nonblank)
  -n                  Number all output lines (same as --number)
  -v                  Use ^ and M- notation, except for LF and TAB (same as --show-
nonprinting)
  <filename>          File name
    ../                                 ./
    VZbase.pol                          VZbase1.pol
    VZbase2.pol                         cc_logs/
    dhcp-reply.pcap                     dhcp-reply.pkt
    dhcpreply.pkt                       dhcpresp.pkt
    dhcpresp.py                         lost+found/
    nsi.dmp                             nsi_last_req.dmp
    nsi_new.dmp                         nsi_re.dmp
    old_nsi_first_req_after_reboot.dmp  old_nsi_last_req.dmp
    primary.cfg                         rest.tar
    rest/                               ssl/
    test.xsf                            vmt/
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

cd

```
cd directory_name
```

Description

Changes the current working directory to the directory of the specified file system or relative to the current working directory.

Syntax Description

cd	Change current working directory.
directory_name	Pathname of a directory.

Default

N/A.

Usage Guidelines

Use this command to change the current working directory to the directory of the specified file system.

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

check policy attribute

```
check policy attribute {attr}
```

Description

Displays the syntax of the specified policy attribute.

Syntax Description

attr	Specifies the attribute check.

Default

N/A.

Usage Guidelines

Use this command to display the syntax of policy attributes. The command displays any additional keywords to use with this attribute, and the types of values expected.

Policy attributes are used in the rule entries that make up a policy file.

For each attribute, this command displays which applications use the attribute, and whether the attribute is a match condition or a set (action, action modifier) condition.

The current applications are:

- *ACL (Access Control List)*—access-lists.
- RT—routing profiles, route maps.
- CLF—CLEAR-Flow.

The syntax display does not show the text synonyms for numeric entries. For example, the icmp-type match condition allows you to specify either an integer or a text synonym for the condition. Specifying icmp-type 8 or icmp-type echo-request are equivalent, but the syntax display shows only the numeric option.

Note

The syntax displayed is used by the policy manager to verify the syntax of policy files. The individual applications are responsible for implementing the individual attributes. Inclusion of a particular policy attribute in this command output does not imply that the attribute has been implemented by the application. See the documentation of the particular application for detailed lists of supported attributes.

Example

The following example displays the syntax of the policy attribute icmp-type:

```
check policy attribute icmp-type
```

The following is sample output for this command:

```
( match ) ( ACL )
icmp-type <uint32 val>
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

check policy

```
check policy policy-name {access-list}
```

Description

Checks the syntax of the specified policy.

Syntax Description

policy-name	Specifies the policy to check.
access-list	Specifies that an access list specific check is performed.

Default

N/A.

Usage Guidelines

Use this command to check the policy syntax before applying it. If any errors are found, the line number and a description of the syntax error are displayed. A policy that contains syntax errors will not be applied.

This command can only determine if the syntax of the policy file is correct and can be loaded into the policy manager database. Since a policy can be used by multiple applications, a particular application may have additional constraints on allowable policies.

Example

The following example checks the syntax of the policy zone5:

```
check policy zone5
```

If no syntax errors are discovered, the following message is displayed:

```
Policy file check successful.
```

History

This command was available in ExtremeXOS 10.1.

The success message and the access-list keyword was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear access-list counter

```
clear access-list {dynamic} counter {countername} {any | ports port_list
   | vlan vlan_name} {ingress | egress}
```

Description

Clears the specified access list counters.

Syntax Description

dynamic	Specifies that the counter is from a dynamic *ACL*.
countername	Specifies the ACL counter to clear.
any	Specifies the wildcard ACL.
port_list	Specifies to clear the counters on these ports.
vlan_name	Specifies to clear the counters on the *VLAN (Virtual LAN)*.
ingress	Clear the ACL counter for packets entering the switch on this interface.
egress	Clear the ACL counter for packets leaving the switch from this interface.

Default

The default direction is ingress; the default ACL type is non-dynamic.

Usage Guidelines

Use this command to clear the ACL counters. If you do not specify an interface, or the any option, you will clear all the counters.

Example

The following example clears all the counters of the ACL on port 2:1:

```
clear access-list counter port 2:1
```

The following example clears the counter counter2 of the ACL on port 2:1

```
clear access-list counter counter2 port 2:1
```

History

This command was first available in ExtremeXOS 10.1.

The **vlan** option was first available in ExtremeXOS 11.0.

The **egress** and **dynamic** options were first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear access-list meter

```
clear access-list meter {meter_name} [any | ports [all | port_list ] |
   vlan vlan_name]
```

Description

Clears the specified access list meters.

Syntax Description

meter_name	Specifies the *ACL* meter to clear.
any	Clear the meter applied to wildcard, including all VLANs and all ports.
ports	Clear the meter applied to a specific port list.
port_list	Specifies to clear the counters on these ports.
vlan	Clear the meter applied to a specific *VLAN*.
vlan_name	Specifies to clear the counters on the VLAN.

Default

N/A.

Usage Guidelines

Use this command to clear the out-of-profile counters associated with the meter configuration.

Example

The following example clears all the out-of-profile counters for the meters of the ACL on port 2:1:

```
clear access-list meter port 2:1
```

The following example clears the out-of-profile counters for the meter meter2 of the ACL on port 2:1:

```
clear access-list meter meter2 port 2:1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear account lockout

```
clear account [all | name] lockout
```

Description

Re-enables an account that has been locked out (disabled) for exceeding the permitted number failed login attempts. This was configured by using the `configure account [all | name] password-policy lockout-on-login-failures [on | off]` command.

Syntax Description

all	Specifies all users.
name	Specifies an account name.

Default

N/A.

Usage Guidelines

This command applies to sessions at the console port of the switch as well as all other sessions.

You can re-enable both user and administrative accounts, once they have been disabled for exceeding the 3 failed login attempts.

Note
The failsafe accounts are never locked out.

This command only clears the locked-out (or disabled) condition of the account. The action of locking out accounts following the failed login attempts remains until you turn it off by issuing the `configure account [all | name] password-policy lockout-on-login failures off` command.

Example

The following command re-enables the account finance, which had been locked out (disabled) for exceeding 3 consecutive failed login attempts:

```
clear account finance lockout
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear bgp flap-statistics

```
clear bgp {neighbor} remoteaddr {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} flap-statistics
   [all | rd rd_value |as-path path expression | community [no-advertise
   | no-export | no-export-subconfed | number community_num | AS_Num:Num]
   | network [any / netMaskLen | networkPrefixFilter] {exact}]
```

Description

Clears flap statistics for routes to specified neighbors.

Syntax Description

all	Specifies flap statistics for all routes.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP (Border Gateway Protocol)* neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
rd_value	Specifies the Route Distinquisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_num	Specifies a community number.
AS_Num	Specifies an autonomous system ID (0-65535).
Num	Specifies a community number.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a subnet mask length (number of bits).
networkPrefixFilter	Specifies an IP address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

Use this command to clear flap statistics for a specified BGP neighbor.

The option network **any** / *netMaskLen* clears the statistics for all BGP routes whose mask length is equal to or greater than *maskLength*, irrespective of their network address.

The option network **any** / *netMaskLen* exact clears the statistics for all BGP routes whose mask length is exactly equal to *maskLength*, irrespective of their network address.

To clear flap statistics on Layer 3 VPNs, you must configure this feature in the context of the *MPLS (Multiprotocol Label Switching)*-enabled VR; this feature is not supported for BGP routes on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Example

The following command clears the flap statistics for a specified neighbor:

```
clear bgp neighbor 10.10.10.10 flap-statistics all
```

History

This command was first available in ExtremeXOS 10.1.

The *netMaskLen* options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 in BGP was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear bgp neighbor counters

```
clear bgp neighbor [remoteaddr | all] counters
```

Description

Resets the *BGP* counters for one or all BGP neighbor sessions to zero.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a specific BGP neighbor.
all	Specifies that counters for all BGP neighbors should be reset.

Default

N/A.

Usage Guidelines

This command resets the following counters:

- In-total-msgs
- Out-total-msgs
- In-updates
- Out-updates
- FsmTransitions

The command clear counters also resets all counter for all BGP neighbors. For BGP, the clearcounters command is equivalent to the following BGP command:

```
clear bgp neighbor all counters
```

This command applies to the current VR or VRF context.

Example

The following command resets the counters for the BGP neighbor at 10.20.30.55:

```
clear bgp neighbor 10.20.30.55 counters
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear bootprelay ipv6 prefix-delegation snooping

```
clear bootprelay ipv6 prefix-delegation snooping [ {ipv6-prefix}
   ipv6_prefix |ipv6-prefix all] [ {vlan} vlan_name |vlan all]
```

Description

Clears information about a snooped IPv6 delegate prefix on a *VLAN* or all VLANs.

Syntax Description

ipv6_prefix	Specifies a snooped IPv6 prefix (/prefix length) delegated via *DHCP (Dynamic Host Configuration Protocol)* to clear.
ipv6-prefix all	Clears all snooped IPv6 prefixes delegated via DHCP.
vlan_name	Specifies a VLAN.
vlan all	Clears all snooped IPv6 prefixes delegated via DHCP on all VLANs.

Default

N/A

Usage Guidelines

You can clear a specific snooped IPv6 delegated prefix. You can also clear all snooped IPv6 delegated prefixes on a specific VLAN or on all VLANs.

Example

The following example clears information about all snooped IPv6 delegat prefixes on all VLANs.

```
clear bootprelay ipv6 prefix-delegation snooping ipv6-prefix all vlan all
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear cdp counters

```
configure cdp counters {ports ports_list}
```

Description

Clears the CDP counter statistics.

Syntax Description

ports	Specifies the ports to clear.
ports_list	Specifies the port list.

Default

N/A.

Usage Guidelines

Use this command to clear the CDP counter statistics.

Example

The following example clears the CDP ports counters:

```
clear cdp counters
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear cdp neighbor

```
clear cdp neighbor [device id device_id | all]
```

Description

Clears the CDP neighbor information.

Syntax Description

device id	Specifies the Device Identifier to be used in CDP.
device_id	Specifies the Device Identifier of neighbor.
all	Specifies all CDP neighbors.

Default

N/A.

Usage Guidelines

Use this command to clear the CDP neighbor information.

Example

The following command clears all CDP neighbor associations:

```
clear cdp neighbor all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters

```
clear counters
```

Description

Clears all switch statistics and port counters, including port packet statistics, bridging statistics, IP statistics, and log event counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You should view the switch statistics and port counters before you clear them. Use the show ports command to view port statistics. Use the `show log counters` command to show event statistics.

The CLI also provides a number of options that you can specify with the clear counters command. If you specify an option, the switch only clears the statistics for that option. For example, if you want to clear, reset only the *STP (Spanning Tree Protocol)* statistics and counters, use the `clear counters stp` command. For more detailed information about those commands, see the specific chapter in the *Switch Engine 32.2 User Guide*.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period you are monitoring.

Note
For the ENTERASYS-POLICY-PROFILE-MIB, the `clear counters` command does not clear counter32.

Example

The following command clears all switch statistics and port counters:

```
clear counters
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters bfd

```
clear counters bfd {session | interface}
```

Description

Clears the counters associated with BFD specific settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to clear the counters in the BFD session or interface (*VLAN*). If neither session or interface are specified, the command clears all counters in BFD.

Example

The following command clears all counters in BFD:

```
# clear counters bfd
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters bfd missed-hellos

```
clear counters bfd missed-hellos {session-id first {- last} | neighbor
   ipaddress {vr [vrname | all]} | vr [vrname | all]} {current | history
   | both}
```

Description

This command clears the bfd missed hellos counters.

Syntax Description

session-id	Clear counters for sessions having session ID within the given range.
first	Only or first of range of session ID.
last	Last of range of session ID .
neighbor	Neighbor address.
ipaddress	Specify IPv4 or IPv6 destination address.
vr	Virtual router.
vrname	Virtual router name.
all	All virtual routers.
current	Clear only current set of bins.
history	Clear only historical set of bins.
both	Clear both current set and historical set of bins.

Default

Current.

Usage Guidelines

Sessions can be cleared by specifying neighbor IP, by specifying range of session IDs or by specifying VR name. In addition, current bins and historical bins can be cleared separately. These options would help resetting one particular session/bin while tests can run in other sessions/bins.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters cfm segment all

```
clear counters cfm segment all
```

Description

This command clears both frame-delay and frame-loss information for all existing segments.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to clear both frame-delay and frame-loss information for all existing segments.

Example

```
# clear co cfm seg all
# sho cfm seg
CFM Segment Name                : cs10

clear counters cfm segment all frame-delay

```
clear counters cfm segment all frame-delay
```

Description

This command clears only frame-delay information for all existing segments.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to clear only frame-delay information for all existing segments.

Example

```
# clear co cfm seg all frame-delay
#
#
#
# sho cfm segment

clear counters cfm segment frame-loss mep

```
clear counters cfm segment segment_name frame-loss mep mep_id
```

Description

This command clears only frame-loss information for the given MEP in segment with given segment name.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to clear only frame-loss information for the given MEP in segment with given segment name.

Example

```
# clear counters cfm segment "cs2" frame-loss mep 3
#
#
#
# sho cfm segment

clear counters cfm segment

```
clear counters cfm segment segment_name
```

Description

This command clears both frame-delay and frame-loss information for segment with given segment name.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to clear both frame-delay and frame-loss information for segment with given segment name.

Example

```
# clear co cfm seg cs2
#
# sho cfm seg cs2
CFM Segment Name               : cs2
Domain Name                    : dom1

```
#
#
#
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters cfm session missed-hellos

```
clear counters cfm session missed-hellos { domain_name
   { association_name { {ports port_list} { end-point [up|down] } } } }
   {current | history | both}
```

Description

This command clears counters for current or historical cfm session missed-hellos.

Syntax Description

domain_name	IEEE 802.1ag Domain name
association_name	IEEE 802.1ag or ITU-T Y.1731 Association name
ports	Specify ports to clear counters.
port_list	List of ports to clear counters.
end-point	Specify MEPs (Maintenance association End Point) to clear counters.
up	End point is up.
down	End point is down.
current	Clear only current set of bins.
history	Clear only historical set of bins.
both	Clear both current and historical set of bins.

Default

Current.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters edp

```
clear counters edp {ports ports}
```

Description

Clears the counters associated with *EDP (Extreme Discovery Protocol)*.

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

If you do not specify a port, the EDP counters will be cleared for all ports.

Usage Guidelines

This command clears the following counters for EDP protocol data units (PDUs) sent and received per EDP port:

- Switch PDUs transmitted.
- *VLAN* PDUs transmitted.
- Transmit PDUs with errors.
- Switch PDUs received.
- VLAN PDUs received.
- Received PDUs with errors.

Example

The following command clears the EDP counters on all ports:

```
clear counters edp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters erps

```
clear counters erps ring-name
```

Description

Clear statistics on the specified *ERPS (Ethernet Ring Protection Switching)* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to clear statistics on the specified ERPS ring.

Example

The following command clears statistics on the ERPS ring named “ring1”:

```
clear counters erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

clear counters mpls

```
clear counters mpls {[lsp all | [{vlan} vlan_name | vlan all]]}
```

Description

Clears all packet and byte counters for all *MPLS* LSPs and all MPLS protocol counters for all MPLS interfaces.

Syntax Description

lsp all	Clears all MPLS protocol counters for all MPLS LSPs.
vlan_name	Clears all MPLS protocol counters for the MPLS interface on the specified *VLAN*.
vlan all	Clears all MPLS protocol counters for all MPLS interfaces.

Default

N/A.

Usage Guidelines

This command clears all packet and byte counters for all MPLS LSPs and all MPLS protocol counters for all MPLS interfaces. If the lsp all keywords are specified, all packet and byte counters for all MPLS LSPs are cleared. If the vlan all keywords are specified, all MPLS protocol counters for all MPLS interfaces are cleared. If a VLAN name is specified, all MPLS protocol counters for the MPLS interface on that VLAN are cleared.

Example

This example clears all MPLS counters associated with VLAN 1:

```
clear counters mpls vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters fdb mac-tracking

```
clear counters fdb mac-tracking [mac_addr | all]
```

Description

Clears the event counters for the *FDB (forwarding database)* MAC-tracking feature.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes.
all	Clears the counters for all tracked MAC addresses.

Default

N/A.

Usage Guidelines

The `clear counters` command also clears the counters for all tracked MAC addresses.

Example

The following example clears the counters for all entries in the MAC address tracking table:

```
Switch.1 #  clear counters fdb mac-tracking all
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! clear counters flowmon

```
clear counters flowmon
```

Description

This command clears all groups.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example clears statistics on all Flow Monitor groups:

```
clear counters flowmon
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

clear counters identity-management

```
clear counters identity-management
```

Description

Clears the identity management feature counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears the following identity management statistics counters:

- High memory usage level reached count
- Critical memory usage level reached count
- Max memory usage level reached count
- Normal memory usage level trap sent
- High memory usage level trap sent
- Critical memory usage level trap sent
- Max memory usage level trap sent
- Event notification sent

You can view these counters with the `show identity-management statistics` command.

Note

The clear counters command also clears these counters. The following counters relate to active entries and are not cleared: Total number of users logged in, Total number of login instances, and Total memory used.

Example

The following command clears the identity management feature counters:

```
Switch.4 # clear counters identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters iparp

```
clear counters iparp
```

Description

Clears all the IPARP counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

This example clears all IPARP counters:

```
clear counters iparp
```

History

This command was first available in ExtremeXOS 11.6.

Per virtual router capability was deprecated in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters l2vpn

```
clear counters l2vpn [vpls [vpls_name | all] | vpws [vpws_name | all]]
```

Description

Clears all the specified VPLS or VPWS counters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS VPNs.

Default

N/A.

Usage Guidelines

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when clearing counters for a VPWS. For backward compatibility, the l2vpn keyword is optional when clearing counters for a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

This example clears all VPLS counters for the specified VPLS:

```
clear counters vpls myvpls
```

This example clears all VPWS counters for the specified VPWS:

```
clear counters l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters mpls ldp

```
clear counters mpls ldp {{{vlan} vlan_name} | lsp all}
```

Description

Clears LDP control protocol counters and packet and byte counters associated with LDP LSPs.

Syntax Description

vlan_name	Clears LDP control protocol counters on the specified *VLAN*.
vlan all	Clears LDP control protocol counters on all *MPLS* interfaces.
lsp all	Clears all LDP LSP packet and byte counters.

Default

N/A.

Usage Guidelines

By default, all LDP control protocol counters are cleared for all LDP interfaces and all byte counters. Specifying the vlan keyword clears only the protocol counters associated with a specified LDP interface. Specifying the lsp keyword clears only the packet and byte counters associated with LDP LSPs.

Example

This example clears all LDP control protocol counters and all packet and byte counters for all LDP LSPs:

```
clear counters mpls ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters mpls rsvp-te

```
clear counters mpls rsvp-te {[lsp all | [{vlan} vlan_name | vlan all]]}
```

Description

Clears all packet and byte counters for all RSVP-TE LSPs and all RSVP-TE protocol counters for all *MPLS* interfaces.

Syntax Description

lsp all	Clears all packet and byte counters for all RSVP-TE LSPs.
vlan_name	Clears all RSVP-TE protocol counters for the MPLS interface on the specified *VLAN*.
vlan all	Clears all RSVP-TE protocol counters on all MPLS interfaces.

Default

By default, all RSVP-TE control protocol counters are cleared for all RSVP-TE interfaces.

Usage Guidelines

This command clears all packet and byte counters for all RSVP-TE LSPs and all RSVP-TE protocol counters for all MPLS interfaces. If the lsp all keywords are specified, all packet and byte counters for all RSVP-TE LSPs are cleared. If the vlan all keywords are specified, all RSVP-TE protocol counters for all MPLS interfaces are cleared. If a VLAN name is specified, all RSVP-TE protocol counters for the MPLS interface on that VLAN are cleared.

Example

This example clears the RSVP-TE protocol counters on VLAN 1 only:

```
clear counters mpls rsvp-te vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters mpls static lsp

```
clear counters mpls static lsp {lsp_name | all }
```

Description

Clears the packet and byte counters for one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP for which counters are to be cleared.
all	Specifies that counters are to be cleared for all static LSPs on this LSR.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the counters for a static LSP:

```
clear counters mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters policy

```
clear counters policy
```

Description

Clears policy rule usage statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command resets the counters on each rule to zero and clears the rule usage.

To see a list of used rules, use the **port-hit** option with the command `show policy rule` **port-hit** {**data**} {**detail**} {**wide**}.

Example

The following example clears policy rule usage statistics:

```
# clear counters policy
# show policy rule port-hit
No entries found.
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters ports

```
clear counters ports {port_list | all}
```

Description

Clears the counters associated with the ports.

Syntax Description

ports	Clears port-related statistics on specified ports or all ports in the system.
port_list	Port list for clear operation.
all	All ports in the system.

Default

All ports.

Usage Guidelines

This command clears the counters for the ports, including the following:

- Statistics.
- Transmit errors.
- Receive errors.
- Collisions.
- Packets.

Note
If you use the clear counters command with no keyword, the system clears the counters for all applications.

Example

The following example clears the counters on all ports:

```
clear counters ports all
```

History

This command was first available in ExtremeXOS 11.3.

This command was updated in ExtremeXOS 15.5 to include the *port_list* variable and the **all** keyword.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters ports protocol filter

```
clear counters ports {port_list | all} protocol filter
```

Description

Clears protocol filtering counters.

Syntax Description

port_list	Specifies the port list is separated by a comma (,) or dash (-).
all	Specifies all ports

Default

Disabled.

Usage Guidelines

Use this command to clear protocol filtering counters.

Example

The following example clears all protocol filtering counters:

```
clear counters ports protocol filter
```

The following example clears protocol filtering counters on ports 1-5:

```
clear counters ports 1-5 protocol filter
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters stp

```
clear counters stp {[all | diagnostics | domains | ports]}
```

Description

Clears, resets all *STP* statistics and counters.

Syntax Description

all	Specifies all STP domain, port, and diagnostics counters.
diagnostics	Specifies STP diagnostics counters.
domains	Specifies STP domain counters.
ports	Specifies STP port counters.

Default

N/A.

Usage Guidelines

If you do not enter a parameter, the result is the same as specifying the all parameter: the counters for all domains, ports, and diagnostics are reset.

Enter one of the following parameters to reset the STP counters on the switch:

- all—Specifies the counters for all STPDs and ports, and clears all STP counters.
- diagnostics—Clears the internal diagnostic counters.
- domains—Clears the domain level counters.
- ports—Clears the counters for all ports and leaves the domain level counters.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period that you are monitoring.

Example

The following command clears all of the STP domain, port, and diagnostic counters:

```
clear counters stp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters virtual-network

```
clear counters virtual-network [ all | vn_name ]
```

Description

This command clears statistics (byte/packet counters) on a Virtual Network.

Syntax Description

all	Clear all Virtual Network counters.
vn_name	Clear counters only for the specified Virtual Network string.

Default

N/A.

Usage Guidelines

N/A.

Example

To clear statistics on an existing Virtual Network:

```
clear counters virtual-network vnet44
```

To clear statistics on all Virtual Networks:

```
clear counters virtual-network all
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5520 series switch, and stacks with 5420 and 5520 slots only.

clear counters virtual-network remote-endpoint

```
clear counters virtual-network remote-endpoint vxlan [ all | ipaddress
   ipaddress]
```

Description

Use this command to clear statistics (byte/packet counters) on a Virtual Network remote endpoint.

Syntax Description

all	Clear all remote endpoint counters.
ipaddress	Clear counters for the specified remote endpoint IP address.
ipaddress	A remote endpoint IP address.

Default

N/A.

Usage Guidelines

N/A.

Example

To clear statistics on an existing Virtual Network remote endpoint:

```
clear counters virtual-network remote-endpoint ipaddress vxlan 10.10.10.146
```

To clear statistics on all Virtual Network remote endpoints:

```
clear counters virtual-network remote-endpoint vxlan all
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5520 series switch, and stacks with 5420 and 5520 slots only.

clear counters vpls

```
clear counters vpls [vpls_name | all]
```

Description

Clears all VPLS counters for the specified *vpls_name*.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS VPNs.

Default

N/A.

Usage Guidelines

This command clears all VPLS counters for the specified vpls_name. If the optional all keyword is specified, all packet and byte counters for all VPLS VPNs are cleared.

Example

This example clears all VPLS counters for the specified VPLS:

```
clear counters vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in in the *Switch Engine 32.2 Feature License Requirements* document.

clear counters vr

```
clear counters {vr} vpn-vrf-name
```

Description

Clears statistics information for a VPN Virtual Routing and Forwarding instance (VPN VRF).

Syntax Description

vpn-vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

This command can help to debug control path issues for a VPN VRF. Issuing a global XOS "clear counter" command will also clear VRF counters. This command clears the following counters:

- Route add operation count.
- Route delete operation count.
- Routes dropped count.

This command is supported only on VPN VRFs.

Example

The following command clears the counters for VPN VRF red:

```
Switch.19 # clear counters vr red
```

History

This command was first introduced in XOS Release 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters vrrp

```
clear counters vrrp {{vlan vlan_name} {vrid vridval}}
```

Description

Clears, resets all *VRRP (Virtual Router Redundancy Protocol)* statistics and counters.

Syntax Description

vlan_name	Specifies the name of a VRRP *VLAN*.
vridval	Specifies the VRRP Router ID (VRID) for a VRRP instance. To display the configured VRRP router instances, enter the `show vrrp` command.

Default

N/A.

Usage Guidelines

Use this command to reset the VRRP statistics on the switch. Statistics are not reset when you disable and re-enable VRRP.

If you do not enter a parameter, statistics for all VRRP VLANs are cleared.

If you specify only VLAN name, statistics for all VRRP VRIDs on that VLAN are cleared.

If you specify VLAN name and VRRP VRID, only statistics for that particular VRID are cleared.

Example

The following command clears the VRRP statistics on VRRP VLAN v1:

```
clear counters vrrp vlan v1
```

The following command clears the VRRP statistics for VRID 1 on VRRP VLAN v1:

```
clear counters vrrp vlan v1 vrid 1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

clear counters wred ecn

```
clear counters wred ecn
```

Description

Clears Explicit Congestion Notification (ECN) counters statistics for all ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example clears ECN counter statistics for all ports:

```
# clear counters wred ecn
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear counters xml-notification

```
clear counters xml-notification {all | target}
```

Description

Clears the statistics counters.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to unconfigure and reset all statistics counters.

Example

The following command clears all of the xml-notification statistics counters:

```
clear counters xml-notification all
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear cpu-monitoring

```
clear cpu-monitoring {process name}
```

Description

Clears, resets the CPU utilization history and statistics stored in the switch.

Syntax Description

name	Specifies the name of the process.

Default

N/A.

Usage Guidelines

When you do not specify any keywords, this command clears the CPU utilization history for the entire switch, including processes, and resets the statistics to zero (0).

When you specify process, the switch clears and resets the CPU utilization history for the specified process.

Example

The following command resets the CPU history and resets statistics to 0 for the TFTP process running on a switch:

```
# clear cpu-monitoring process tftpd
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear dns cache

```
clear dns cache
```

Description

Clears the Domain Name System (DNS) cache entries.

Syntax Description

dns	Domain Name System.
cache	Specifies clearing the DNS cache.

Default

N/A.

Usage Guidelines

None.

Example

The following example clears the DNS cache:

```
# clear dns cache
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear dns cache analytics entries

clear **dns cache analytics entries** {{**vr**} *vr_name*}

Description

Clears the Domain Name System (DNS) cache analytics entries for a virtual router (VR).

Syntax Description

dns	Domain Name System.
cache	Specifies the DNS cache.
analytics	Specifies the DNS cache analytics.
entries	Specifies clearing the analyzed DNS queries.

vr	Specifies a VR on which to clear entries.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If not specified, by default the VR of the current command context is used.

Usage Guidelines

This command clears already analyzed DNS queries for a VR. If you do not clear entries with this command, the entries are timed out based on the configured value in the command `configure` **dns cache analytics** [{**timeout** *minutes*} {**max-entries** *max_entries*}]

Example

The following example clears the DNS cache analytics entries for the current VR:

```
# clear dns cache analytics entries
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear eaps counters

```
clear eaps counters
```

Description

Clears, resets the counters gathered by *EAPS (Extreme Automatic Protection Switching)* for all of the EAPS domains and any EAPS shared ports configured on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to clear, reset the EAPS counters.

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring.

To display information about the EAPS counters, use the following commands:

- `show eaps counters` —This command displays summary EAPS counter information.
- `show eaps counters shared-port` —If configured for EAPS shared ports, this command displays summary EAPS shared port counter information.

Example

The following command clears, resets all of the counters for EAPS:

```
clear eaps counters
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear elrp counters

```
clear elrp counters
```

Description

Clears and resets the ELRP counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You should view the switch statistics before you delete the ELRP counters. Use the `show log counters` command to display event statistics.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period that you are monitoring.

With hard-assisted ELRP, the request to clear ACL counters is sent from ELRP to the ACL manager, and then to hardware one at a time. Since there is one ACL counter per VLAN port, it may take some time for all of the counters to be cleared in hardware when multiple ACL counters are used. If you run the `clear elrp counters` command before all counters are reset, the Pkts-Xmit statistics for some VLANs might temporarily show the sum of partially cleared counters.

Example

The following command clears all switch statistics related to ELRP:

```
# clear elrp counters
```

History

This command was first available in ExtremeXOS 11.1.

Hardware-assisted information was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear elsm ports auto-restart

`clear elsm ports` *`port_list`* **`auto-restart`**

Description

Clears one or more ELSM-enabled ports that are in the Down-Stuck state.

Syntax Description

`port_list`	Specifies the ELSM-enabled ports that are permanently in the Down-Stuck state.

Default

N/A.

Usage Guidelines

If you do not have automatic restart enabled, use this command to transition ELSM-enabled ports that are permanently in the Down-Stuck state to the Down state. You can also use the `enable elsm`

`ports port_list auto-restart` command to transition a port from the Down-Stuck state to the Down state.

For information about the ELSM-enabled ports states, see the command `show elsm ports`.

If automatic restart is enabled (this is the default behavior), automatic restart automatically transitions the ports from the Down-Stuck state to the Down state. For more information, see the command enable elsm ports auto-restart.

Example

The following command transitions the ports from the Down-Stuck state to the Down state:

```
clear elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear elsm ports counters

`clear elsm {`**`ports`** *`port_list`*`}` **`counters`**

Description

Clears the statistics gathered by ELSM for the specified ports or for all ports.

Syntax Description

port_list	Specifies the ELSM-enabled ports for which ELSM statistics are being cleared.

Default

N/A.

Usage Guidelines

You should view the ELSM statistics and counters before you clear them. To view ELSM-specific counter information, use the `show elsm ports all | port_list` command. To view summary ELSM information, including the ports configured for ELSM, use the `show elsm` command.

Use this command to clear only the ELSM-related counters. To clear all of the counters on the switch, including those related to ELSM, use the `clear counters` command.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counter, you can see fresh statistics for the time period you are monitoring.

Example

The following command clears the statistics gathered by ELSM for slot 2, ports 1-2:

```
clear elsm ports 2:1-2:2 counters
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear esrp counters

```
clear esrp counters
```

Description

Clears the statistics gathered by *ESRP (Extreme Standby Router Protocol)* for all ESRP domains on the switch.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

Use this command to clear the state transition and the protocol packet counters gathered by ESRP.

The state transition count displays the number of times the ESRP domain entered the following states:

- Aware—An Extreme switch that does not participate in ESRP elections but is capable of listening to ESRP Bridge Protocol Data Units (BPDUs).
- Master—The master switch is the device with the highest priority based on the election algorithm. The master is responsible for responding to clients for Layer 3 routing and Layer 2 switching for the ESRP domain.

- Neutral—The neutral state is the initial state entered by the switch. In a neutral state, the switch waits for ESRP to initialize and run. A neutral switch does not participate in ESRP elections.
- PreMaster—The pre-master state is an ESRP switch that is ready to be master but is going through possible loop detection prior to transitioning to master.
- Slave—The slave switch participates in ESRP but is not elected or configured the master and does not respond to ARP requests but does exchange ESRP packets with other switches on the same *VLAN*. The slave switch is available to assume the responsibilities of the master switch if the master becomes unavailable or criteria for ESRP changes.

  If the slave is in extended mode, it does not send ESRP hello messages; however, it sends PDUs that can trigger a change in the master switch.

  For more information about configuring the ESRP mode of operation on the switch, see the `configure esrp mode [extended | standard]` command. By default, ESRP operates in extended mode.

To display information about the ESRP domain, including the previously described states, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

The protocol packet count displays the number of times ESRP, ESRP-aware, and ESRP error packets were transmitted and received.

To display information about the ESRP counters, use the `show esrp {name} counters` command.

Example

The following command clears the statistics gathered by ESRP:

```
clear esrp counters
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear esrp neighbor

`clear esrp esrpDomain neighbor`

Description

Clears the neighbor information for the specified *ESRP* domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

N/A.

Usage Guidelines

If you add a new switch to your ESRP domain, use this command to clear the existing neighbor information for the ESRP domain. After the switch is up, running, and configured as an ESRP-aware or ESRP-enabled device, new neighbor information is learned.

Before using this command, schedule a downtime for your network. Use this command for maintenance purposes only.

Example

The following example clears the existing neighbor information on the ESRP domain esrp1 after adding a new switch to the ESRP domain:

```
clear esrp esrp1 neighbor
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear esrp sticky

`clear esrp` *esrpDomain* **`sticky`**

Description

Clears the stickiness in the *ESRP* domain and forces the election of the ESRP master switch.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

N/A.

Usage Guidelines

Use the `clear esrp sticky` command to force the election of the ESRP master switch. Before using this command, schedule a downtime for your network.

For example, without stickiness configured, if an event causes the ESRP master to failover to the backup, the previous backup becomes the new master. If another event causes the new master to return to backup, you have experienced two network interruptions. To prevent this, use the `configure esrp election-policy` command and select stickiness as an election algorithm.

If you use sticky as an election metric, and an event causes the ESRP master to failover, ESRP assigns the new master with the highest sticky election metric of 1. Therefore, regardless of changes to the neighbor's election algorithm, the new master retains its position. Sticky is set on the master switch only.

ESRP re-election can occur if sticky is set on the master and a local event occurs. During this time, if the current master has lower election parameters, the backup can become the new master.

If you use `clear esrp esrpDomain sticky` command, it only affects the current master and can trigger ESRP re-election.

Example

The following command clears the stickiness on the ESRP domain esrp1:

```
clear esrp esrp1 sticky
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ethernet oam counters

`clear ethernet oam {ports [port_list] counters`

Description

Clears Ethernet OAM counters.

Syntax Description

port_list	Specifies the particular port(s).

Default

N/A.

Usage Guidelines

Use this command to clear the Ethernet OAM counters on one or more specified ports. If you do not specify the port(s), counters for all ports are cleared.

Example

The following command clears Ethernet OAM counters on port 2:

```
clear ethernet oam ports 2 counters
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is supported on all platforms.

clear fdb

```
clear fdb mac_addr | ports port_list | vlan vlan_name | blackhole| vxlan
   ipaddress remote_ipaddress vr vr_name virtual-network vn_name
```

Description

Clears dynamic *FDB* entries that match the filter.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes.
port_list	Specifies one or more ports or slots and ports.
vlan_name	Specifies a *VLAN* name.
blackhole	Specifies the blackhole entries.
vxlan	Specifies VXLAN.
ipaddress	IP address of the remote endpoint.
remote_ipaddress	IPv4 address of the remote tunnel endpoint whose associated FDB entries need to be cleared.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name. If not specified, the VR context from where this command is executed is used.

virtual-network	MAC addresses associated with a Virtual Overlay Network learning domain.
vn_name	Name of virtual network whose associated FDB entries need to be cleared.

Default

All dynamic FDB entries are cleared by default.

Usage Guidelines

To clear FDB entries on a given remote endpoint (added to any virtual network):

`clear fdb` **`vxlan ipaddress`** *`remote_ipaddress`* {**`vr`** *`vr_name`*}

To clear FDB entries on a given remote endpoint added to given virtual network:

`clear fdb` **`vxlan ipaddress`** *`remote_ipaddress`* {**`vr`** *`vr_name`*} **`virtual-network`** *`vn_name`*

To clear all VXLAN FDB entries (clear all entries learned on the access ports and VXLAN tunnels):

`clear fdb` **`vxlan`**

Example

The following example clears any FDB entries associated with VLAN corporate:

```
clear fdb vlan corporate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear fdb vpls

`clear fdb vpls {`*`vpls_name`* {*`peer_ip_address`*}}

Description

Clears the *FDB* information learned for VPLS.

Syntax Description

vpls_name	Clears all FDB entries for the specified VPLS and its associated *VLAN*.
peer_ip_address	Clears all FDB entries for the pseudowire (PW) associated with the specified VPLS and LDP peer.

Default

N/A.

Usage Guidelines

If the command is used without keywords, every FDB entry learned from any PW is cleared. Using the keywords vpls_name clears every FDB entry, (both PW and front panel Ethernet port for the service VLAN) associated with the specified VPLS and the associated VLAN. If the specified VPLS is not bound to a VLAN, the following error message appears:

```
Error: vpls VPLS_NAME not bound to a vlan
```

Using the keywords vpls_name and peer_ip_address clears all FDB entries from the PW associated with the specified VPLS and LDP peer.

Once the information is cleared from the FDB, any packet destined to a MAC address that has been flushed from the hardware is flooded until the MAC address has been re-learned.

Example

This example clears the FDB information for VPLS 1:

```
clear fdb vpls vpls1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in the *Switch Engine 32.2 Feature License Requirements* document.

clear igmp counters

```
clear igmp counters
```

Description

Clears Internet Group Management Protocol (IGMP) counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Example

The following example clears IGMP counters:

```
# clear igmp counters
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear igmp group

```
clear igmp group {grpipaddress} {{vlan} name}
```

Description

Removes one or all *IGMP (Internet Group Management Protocol)* groups.

Syntax Description

grpipaddress	Specifies the group IP address.
name	Specifies a *VLAN* name.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove learned IGMP group entries instantly. Traffic is impacted until the IGMP groups are relearned. Use this command for diagnostic purposes only.

Example

The following command clears all IGMP groups from VLAN accounting:

```
clear igmp group accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear igmp snooping

```
clear igmp snooping {{vlan} name}
```

Description

Removes one or all *IGMP* snooping entries.

Syntax Description

name	Specifies a *VLAN* name.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove IGMP snooping entries instantly. However, removing an IGMP snooping entry can disrupt the normal forwarding of multicast traffic until the snooping entries are learned again.

The dynamic IGMP snooping entries are removed, and then recreated upon the next general query. The static router entry and static group entries are removed and recreated immediately.

This command clears both the IGMPv2 and IGMPv3 snooping entries.

Example

The following command clears IGMP snooping from VLAN accounting:

```
clear igmp snooping accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear inline-power stats ports

```
clear inline-power stats ports [all | port_list]
```

Description

Clears the inline statistics for the selected port to zero.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Use this command to clear all the information displayed by the `show inline-power stats ports port_list` command.

Example

The following command clears the inline statistics for ports 1–8 on a switch:

```
clear inline-power stats ports 1-8
```

The following command displays cleared inline power configuration information for ports 1–8:

```
show inline-power stats ports 1-8
```

Following is sample output from this command:

```
STATISTICS COUNTERS
Port  State       Class     Absent  InvSig   Denied    OverCurrent   Short
1   delivering  class3        0       0        0          0            0
2   delivering  class3        0       0        0          0            0
3   searching   class0        0       0        0          0            0
```

```
4   searching   class0       0       0       0       0       0
5   searching   class0       0       0       0       0       0
6   searching   class0       0       0       0       0       0
7   searching   class0       0       0       0       0       0
8   searching   class0       0       0       0       0       0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the *PoE (Power over Ethernet)* devices listed in *PoE* section of the *Switch Engine 32.2 User Guide*.

clear ip nat counters vlan

```
clear ip nat counters vlan {vlan_name}
```

Description

Clears the Network Address Translation (NAT) VLAN counters.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
vlan	Specifies VLAN NAT.
counters	Specifies NAT VLAN counters.
vlan_name	Specifies which VLAN to clear NAT counters for. If no VLAN name is specified, all counters are cleared.

Default

N/A.

Usage Guidelines

To view counter information, run the command `show ip nat vlan counters {vlan_name}`.

Example

The following example clears all NAT VLAN counters:

```
# clear ip nat counters vlan
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

clear iparp

```
clear iparp {ip_addr {vr vr_name} | vlan vlan_name | vr vr_name}
   {refresh}
```

Description

Removes dynamic entries in the IP ARP table.

Syntax Description

ip_addr	Specifies an IP address.
vlan_name	Specifies a *VLAN* name.
vr_name	Specifies a Virtual Router (VR) or Virtual Router Forwarding instance (VRF) name.
refresh	Refreshes the ARP cache and deletes the inactive entries.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Permanent IP ARP entries are not affected.

This command is specific to a single VR or VRF, and it applies to the current VR context if you do not specify a VR or VRF.

Based on the attributes you specify, the refresh attribute refreshes and deletes the corresponding ARP entries as follows:

- `clear iparp` **refresh**—Refreshes the entire ARP table and deletes all inactive entries.
- `clear iparp` *ip_addr* **refresh**—Refreshes the specified IP address and deletes the IP ARP entry if the ARP request for IP address fails.
- `clear iparp` **vlan** *vlan_name* **refresh**—Refreshes all IP ARP entries associated with the VLAN and deletes all inactive entries for the VLAN.
- `clear iparp` **vr** *vr_name* **refresh**—Refreshes all IP ARP entries associated with the VR and deletes all inactive entries for the VR.

Example

The following example removes a dynamically created entry from the IP ARP table:

```
clear iparp 10.1.1.5
```

The following example refreshes the ARP entry by sending an ARP request for the IP address 10.1.1.5. If the ARP response is received, the dynamic entry is retained; otherwise, the dynamic entry is removed from the IP ARP table if the ARP response is not received.

```
clear iparp 10.1.1.5 refresh
```

History

This command was first available in ExtremeXOS 10.1.

The **refresh** keyword was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ip-security anomaly-protection notify cache

```
clear ip-security anomaly-protection notify cache {slot [slot | all ]}
```

Description

Clear the local protocol anomaly event cache.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

N/A.

Usage Guidelines

This command clears the local protocol anomaly event cache.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ip-security arp validation violations

```
clear ip-security arp validation violations
```

Description

Clears the violation counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears the ARP validation violation counters.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ip-security dhcp-snooping entries

```
clear ip-security dhcp-snooping entries { vlan } vlan_name
```

Description

Clears the *DHCP* binding entries present on a *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server.

Default

N/A.

Usage Guidelines

Use this command to clear the DHCP binding entries present on a VLAN. When an entry is deleted, all its associated entries (such as source IP lockdown, secured ARP, and so on) and their associated ACLs, if any, are also deleted.

Example

The following command clears the DCHP binding entry temporary from the VLAN:

```
clear ip-security dhcp-snooping entries temporary
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ip-security source-ip-lockdown entries ports

```
clear ip-security source-ip-lockdown entries ports [ ports | all ]
```

Description

Clears locked-down source IP addresses on a per-port basis.

Syntax Description

ports	Specifies the port or ports to be cleared.
all	Specifies that all ports are to be cleared.

Default

N/A.

Usage Guidelines

Use this command to clear locked-down source IP addresses on a per port basis. This command deletes the entries on the indicated ports and clears the associated ACLs.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ipv6 dad

```
clear ipv6 dad {{vr} vr_name {ipaddress} | vr all | {vlan} vlan_name}
   {counters}
```

Description

Clears the counters for the DAD feature.

Syntax Description

vr_name	Specifies a VR for which to clear the counters.
ipaddress	Specifies an IPv6 address for which to clear the counters.
vlan_name	Specifies a *VLAN* for which to clear the counters.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The vr all option clears the DAD counters for all IPv6 interfaces on the switch.

This command clears the DAD failure counters and removes the MAC for the conflicting IPv6 address after the duplicate address condition has been resolved. The DAD counters and saved MAC addresses are not automatically cleared; they must be cleared with this command.

Example

The following command clears the DAD counters for all IPv6 interfaces in all VRs:

```
clear ipv6 dad vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear isis counters

```
clear isis counters
```

Description

This command clears all IS-IS-related counters in the current virtual router.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears all area and *VLAN* counters.

The following area counters are cleared: corrupted LSPs, LSPDB overloads, manual address from area count, LSP sequence number wraps, LSP sequence number skips, LSP purges, partition changes, and SPF calculations.

The following VLAN counters are cleared: adjacency changes, adjacency initialization failures, rejected adjacencies, ID field length mismatches, maximum area address mismatches, authentication type failures, authentication failures, DIS changes, hello PDU TX and RX count, LSP TX and RX count, CSNP TX and RX count, PSNP TX and RX count, unknown PDU type TX and RX count.

Example

The following command clears all IS-IS counters:

```
clear isis counters
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear isis counters area

```
clear isis counters area [area_name | all]
```

Description

This command clears all IS-IS counters for the specified router process or all router processes.

Syntax Description

area_name	Specifies the router process for which counters are cleared.
all	Clears IS-IS counters for all router processes.

Default

N/A.

Usage Guidelines

The following counters are cleared: corrupted LSPs, LSPDB overloads, manual address from area count, LSP sequence number wraps, LSP sequence number skips, LSP purges, partition changes, SPF calculations, authentication type failures, authentication failures, and ID field length mismatches.

Example

The following command clears the IS-IS counters for areax:

```
clear isis counters area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear isis counters vlan

```
clear isis counters [vlan all | {vlan} vlan_name]
```

Description

This command clears all IS-IS counters for one or all *VLAN*s.

Syntax Description

vlan all	Clears the counters for all VLANs.
vlan_name	Specifies a single VLAN for which counters are cleared.

Default

N/A.

Usage Guidelines

This command only affects VLANs that have been added to IS-IS router processes. The following counters are cleared: adjacency changes, adjacency initialization failures, rejected adjacencies, ID field length mismatches, maximum area address mismatches, authentication type failures, authentication failures, DIS changes, hello PDU TX and RX count, LSP TX and RX count, CSNP TX and RX count, PSNP TX and RX count, unknown PDU type TX and RX count.

Example

The following command clears the IS-IS counters for all VLANs:

```
clear isis counters vlan all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear l2pt counters rtep

```
clear l2pt counters {[vlan vlan_name {{vxlan{vr vr_name} rtep
   rtep_ipv4}}}
```

Description

Clears L2PT RTEP counters.

Syntax Description

vlan	Optionally clears counters only on a specific VLAN.
vlan_name	Specifies the VLAN name.
vxlan	Specifies Virtual eXtensible LAN.
vr	Specifies Virtual Router.
vr_name	Specifies the Virtual Router Name. If not specified, the VR of the current command context is used.
rtep	Specifies Remote Tunnel End Point.
rtep_ipv4	Specifies the Remote Tunnel End Point IPv4 address.

Default

N/A.

Usage Guidelines

Use this command to clear L2PT RTEP counters.

Example

The following example clears L2PT counters on RTEP 2.2.2.2 of VxLAN interface:

```
clear l2pt counters vlan tenant vxlan rtep 2.2.2.2
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is supported on the ExtremeSwitching 5420 and 5520 series switches, and stacks with 5420 and 5520 slots only.

clear l2pt counters vlan

```
clear l2pt counters {vlan vlan_name {ports port_list}}
```

Description

Clears L2PT *VLAN* counters.

Syntax Description

vlan	Optionally clears counters only on a specific VLAN.
vman	Optionally clears counters only on a specific VMAN.
vlan_name	Specifies the VLAN name.
ports *port_list*	Optionally clears counters only on specific ports of the VLAN/VMAN. The port list is separated by a comma (,) or dash (-).

Default

Disabled.

Usage Guidelines

Use this command to clear L2PT VLAN counters.

Example

The following example clears all L2PT counters:

```
clear l2pt counters
```

The following example clears L2PT counters on VLAN *vlan1*:

```
clear l2pt counters vlan vlan1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear l2pt counters vman

```
clear l2pt counters {vman vman_name {ports port_list}}
```

Description

Clears L2PT VMAN counters.

Syntax Description

vlan	Optionally clears counters only on a specific *VLAN*.
vman	Optionally clears counters only on a specific VMAN.
vlan_name	Specifies the VLAN name.
ports *port_list*	Optionally clears counters only on specific ports of the VLAN/VMAN. The port list is separated by a comma (,) or dash (-).

Default

Disabled.

Usage Guidelines

Use this command to clear L2PT VMAN counters.

Example

The following example clears all L2PT counters:

```
clear l2pt counters
```

The following example clears L2PT counters on VMAN vlan2:

```
clear l2pt counters vman vlan2
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear l2pt counters vpls

```
clear l2pt counters {[vpls vpls_name {peer ipaddress} | vpws vpws_name]}
```

Description

Clears L2PT counters.

Syntax Description

vpls	Optionally clears counters only on a specific VPLS.
vpls_name	Alpha numeric string identifying VPLS VPN.
peer *ipaddress*	Optionally clears counters only on a specific peer of the VPLS. The variable specifies an IPv4 address.
vpws *vpws_name*	Optionally clears counters only on a specific VPWS. The variable is an alphanumeric string identifying the VPWS VPN.

Default

Disabled.

Usage Guidelines

Use this command to clear L2PT counters.

Example

The following example clears L2PT counters on peer 1.1.1.1 of VPLS vpls1:

```
clear l2pt counters vpls vpls1 peer 1.1.1.1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear lacp counters

```
clear lacp counters
```

Description

Clears the counters associated with Link Aggregations Control Protocol (LACP).

Syntax Description

This command has no parameters or variables.

Default

N/A.

Usage Guidelines

This command clears the following counters for LACP; it sets these counters back to 0 for every LACP port on the device:

- LACP PDUs dropped on non_LACP ports.
- Stats:
  - Rx - Accepted.
  - Rx - Dropped due to error in verifying PDU.
  - Rx - Dropped due to LACP not being up on this port.
  - Rx - Dropped due to matching own MAC.
  - Tx - Sent Successfully.
  - Tx - Transmit error.

Example

The following command clears the LACP counters on all ports:

```
clear lacp counters
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear lldp neighbors

```
clear lldp neighbors [all | port port_list]
```

Description

Clears the *LLDP (Link Layer Discovery Protocol)* neighbor information collected for one or all ports on the switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

LLDP neighbor information for each port is automatically cleared after the period defined by the TTL TLV if no update LLDP protocol data unit (LLDPDU) is received. This command immediately clears the LLDP neighbor information for the specified ports.

Example

The following command clears the LLDP information collected for all ports on the switch:

```
clear lldp neighbors all
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear log

```
clear log { static | messages [memory-buffer | nvram]}
```

Description

Clears the log messages in memory and NVRAM.

Syntax Description

static	Specifies that the messages in the NVRAM and memory-buffer targets are cleared.
memory-buffer	Clears entries from the memory buffer.
nvram	Clears entries from NVRAM.

Default

N/A.

Usage Guidelines

The switch log tracks configuration and fault information pertaining to the device.

By default, log entries that are sent to the NVRAM remain in the log after a switch reboot. The `clear log` and `clear log messages memory-buffer` commands remove entries in the memory buffer target; the clear log static and clear log messages nvram commands remove messages from the NVRAM target. In addition, the clear log static command will also clear the memory buffer target.

Execution of these commands on a backup or standby node results in the clearing of that node's information only. Execution of these commands on the master node results in the clearing of information on all nodes in the system.

Example

The following command clears all log messages, from the NVRAM:

```
# clear log static
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear log counters

```
clear log counters [event-condition | [all | event-component] {severity
   severity {only}}]
```

Description

Clears the incident counters for events.

Syntax Description

event-condition	Specifies the event condition counter to clear.
all	Specifies that all events counters are to be cleared.
event-component	Specifies that all the event counters associated with a particular component should be cleared.
severity	Specifies the minimum severity level of event counters to clear (if the keyword only is omitted).
only	Specifies that only event counters of the specified severity level are to be cleared.

Default

If severity is not specified, then the event counters of any severity are cleared in the specified component.

Usage Guidelines

This command sets the incident counters to zero for each event specified. To display event counters, use the following command: `show log counters`

See the command `show log` for more information about severity levels.

To get a listing of the event conditions in the system, use the following command: `show log events {details}`

To get a listing of the components present in the system, use the following command: `show log components`

In a SummitStack, execution of these commands on a backup or standby node results in the clearing of that node's information only. Execution of these commands on the master node results in the clearing of information on all nodes in the system.

Example

The following example clears the event counters for event conditions of severity error or greater in the component *BGP*:

```
clear log counters "BGP" severity error
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear mac-locking station

```
clear mac-locking station [all | {mac station_mac_address} {first-
   arrival | static} {ports port_list}]
```

Description

Clears MAC lock station information.

Syntax Description

all	Clears all MAC locking station information for end stations connected to this switch.
station_mac_address	Specifies a MAC address.
first-arrival	Clears first-arrival MAC locking station information.
static	Clears static MAC locking station information.
port_list	Specifies one or more ports or slots and ports.

Default

N/A

Usage Guidelines

None.

Example

The following example clears all MAC locking information:

```
clear mac-locking station all
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear macsec counters

```
clear macsec counters {ports [port_list]}
```

Description

Clears counters for MAC Security (MACsec) encryption and authentication.

Syntax Description

ports	Specifies port to configure.
port_list	Lists ports to clear MACsec counters on.

Default

Counters for all MACsec ports are cleared unless you choose specific MACsec ports.

Usage Guidelines

This command clears the 4 packet/octet values of the `show macsec` **ports** *port-list* **usage** command, as well as all the statistics shown under the heading "SecY Interface Statistics" of the `show macsec` **ports** *port-list* **detail** command.

Additionally, all MACsec port statistics are cleared by the `clear counters ports {`*port_list* | **all**`}` command.

Example

The following example clears all MACsec counters on port 44:

```
# clear macsec counters ports 44
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

clear meter out-of-profile

```
clear meter {metername} out-of-profile {disabled-ports} {status |
   counters} {ports [ all | portlist | port_group ]}
```

Description

This command allows the clearing of the out-of-profile status and rate-limit counter for meters that have been exceeded. For an input meter and the entered ports, the **status** option will remove the ports from the disabled port out-of-profile list for the entered meter, re-enable ports that may have been disabled due to the out-of-profile meter, and re-enable the syslog and traps for those ports as well. For an input meter and the entered ports, the **counter** option will reset the counters. If the neither the status nor counter option is specified, both will be cleared. If the disabled-ports options is specified, only the out-of-profile meters that have disabled ports will be cleared. If no options are specified, all the out-of-profile status and counters will be cleared. If no ports are specified, the command clears the out-of-profile counter for a global meter. Note that the effected counter and status are the aggregates of the rule based counters for both *ACL* and dot1p rules.

Syntax Description

metername	Meter name.
disabled-ports	Clear only the meter out-of-profile status that resulted in disabled-port action.
status	Clear only the meter out-of-profile status.
counters	Clear only the meter counters.
ports	Clear the meter applied to a specified port-list.
all	Clear meter out-of-profile status on all ports.
portlist	Port list separated by a comma or -.
port_group	Port group name.

Default

N/A.

Usage Guidelines

None.

Examples

```
clear meter out-of-profile

clear meter inmeter1 out-of-profile ports 1-5
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is availabe on all platforms.

clear mld counters

```
clear mld counters {{vlan} vlan_name}
```

Description

Clears MLD statistics counters.

Syntax Description

vlan_name	Specifies a *VLAN* name.

Default

N/A.

Usage Guidelines

Use this command to manually clear MLD statistics counters.

Example

The following example clears all MLD counters for all VLANs:

```
clear mld counters
```

If a VLAN is specified, only the counters on the specific VLAN is cleared.

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

clear mld group

```
clear mld group {v6grpipaddress} {{vlan} name}
```

Description

Removes one or all MLD groups.

Syntax Description

v6grpipaddress	Specifies the group IP address.
name	Specifies a *VLAN* name.

Default

N/A.

Usage Guidelines

This command is used to manually remove learned MLD group entries instantly.

Example

The following command clears all MLD groups from VLAN accounting:

```
clear mld group accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

clear mld snooping

```
clear mld snooping {{vlan} name}
```

Description

Removes one or all MLD snooping entries.

Syntax Description

name	Specifies a *VLAN* name.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove MLD snooping entries instantly. However, removing an MLD snooping entry can disrupt the normal forwarding of multicast traffic until the snooping entries are learned again.

The static and dynamic MLD snooping entries are removed, and then recreated upon the next general query. The static router entry is removed and recreated immediately.

Example

The following command clears MLD snooping from VLAN accounting:

```
clear mld snooping accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

clear msdp counters

```
clear msdp counters {peer remoteaddr | peer all | system} {vr vrname}
```

Description

This command resets the *MSDP (Multicast Source Discovery Protocol)* counters to zero.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
system	Clears the global MSDP counters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

The clear msdp counters command clears the following MSDP counters:

- Per peer counters:
  - Number of SA messages received.
  - Number of SA messages transmitted.
  - Number of SA request messages received.
  - Number of SA request messages transmitted.
  - Number of SA response messages received.
  - Number of SA response messages transmitted.
  - Number of SA messages received without encapsulated data.
  - Number of SA messages transmitted without encapsulated data.
  - Number of SA messages received with encapsulated data.
  - Number of SA messages transmitted with encapsulated data.
  - Number of times the MSDP peer attained an “ESTABLISHED” state.
  - Number of times the peer-RPF check failed.
  - Number of times the TCP connection attempt failed.
  - Total number of received messages.
  - Total number of transmitted messages.
- Global counters:
  - None defined.

The `clear counters` command will also clear all MSDP counters, but it clears the counters for all other applications too.

Example

The following command clears the counters for an MSDP peer with the IP address 192.168.45.43:

```
clear msdp counters peer 192.168.45.43
```

The following command clears the all peer and global counters:

```
clear msdp counters
```

The following command clears all counters for a particular peer:

```
clear msdp counters peer 192.168.32.45
```

The following command clears the counters of all MSDP peers:

```
clear msdp counters peer all
```

The following command clears the global counters:

```
clear msdp counters system
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear msdp sa-cache

```
clear msdp sa-cache {{peer} remoteaddr | peer all} {group-address grp-
   addr} {vr vrname}
```

Description

This command purges all SA cache entries and notifies the PIM that the SA cache is empty.

Syntax Description

peer all	Specifies all *MSDP* peers. All matching SA cache entries from all peers are removed from the database.
grp-addr	Specifies the IP address and subnet mask of the multicast group you want to clear. All SA cache entries that match the specified group address are removed from the database.
remoteaddr	Specifies the IP address of the MSDP peer. All matching SA cache entries learned from the specified peer are removed from the database.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

MSDP receives SA messages periodically. After clearing SA cache entries from the local database, MSDP relearns those entries during the next advertisement from its peer.

Example

The following example clears SA cache records for an MSDP peer with the IP address 192.168.45.43:

```
clear msdp sa-cache peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear neighbor-discovery cache

```
clear neighbor-discovery cache ipv6 {ipv6address {vr vr_name} | vlan
   vlan_name | vr vr_name} refresh
```

Description

Deletes a dynamic entry from the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
vlan_name	Specifies an IPv6 configured *VLAN*.
refresh	Refreshes the IPv6 neighbor discovery cache and deletes the inactive entries.

Default

N/A.

Usage Guidelines

This command clears dynamic entries from the neighbor cache. The **vr** option is used to specify the VR or VRF on which the operation is performed. When this option is omitted, it applies to current VR context.

When the **ipv6address** or **vlan** options are specified, only the entries with matching IPv6 addresses or that correspond to that VLAN are cleared.

Based on the attributes you specify, the refresh attribute refreshes and deletes the corresponding IPv6 neighbor discovery entries as follows:

- `clear neighbor-discovery cache` **refresh**—Refreshes the entire IPv6 neighbor discovery cache and deletes all inactive entries.
- `clear neighbor-discovery cache` *ipv6address* **refresh**—Refreshes the specified neighbor-discovery entry and deletes the neighbor-discovery entry if the neighbor solicitation for the IP address fails.
- `clear neighbor-discovery cache` **vlan** *vlan_name* **refresh**—Refreshes all neighbor-discovery entries associated with the VLAN and deletes all inactive entries for the VLAN.
- `clear neighbor-discovery cache` **vr** *vr_name* **refresh**—Refreshes all neighbor-discovery entries associated with the VR and deletes all inactive entries for the VR.

Example

The following example clears all entries from the neighbor cache:

```
clear neighbor-discovery cache
```

The following example refreshes all entries in the neighbor discovery cache and delete inactive entries if the neighbor solicitation fails:

```
clear neighbor-discovery cache refresh
```

History

This command was first available in ExtremeXOS 11.2.

The **refresh** option was added in ExtremeXOS 15.7.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

clear netlogin state

```
clear netlogin state {port port_list}
```

Description

Clears and initializes the network login sessions on a *VLAN* port.

Syntax Description

port_list	Specifies the ports to clear.

Default

None.

Usage Guidelines

Clear the states of every MAC learned on this VLAN port and put the port back to unauthenticated state. The port will be moved to its original VLAN if configured in campus mode.

Example

The following command clears the Network Login state of port 2:9:

```
clear netlogin state port 2:9
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear netlogin state agent

```
clear netlogin state agent portportlist [dot1x |mac |web-based]
```

Description

Clears the *NetLogin* authentication state.

Syntax Description

port *portlist*	Clears only for the specified ports.
dot1x	Clears only the 802.1x authentication state.
mac	Clears only the MAC authentication state.
web-based	Clears only web-based authentication state.

Default

N/A

Example

The following example clears the dot1x authentication state on port 1:

```
clear netlogin state agent port 1 dot1x
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear netlogin state mac-address

```
clear netlogin state mac-address mac
```

Description

Initialize/reset the network login sessions for a specified supplicant.

Syntax Description

mac	Specifies the MAC address of the supplicant.

Default

N/A.

Usage Guidelines

This command is essentially equivalent to a particular supplicant logging out. The MAC address will be cleared from the *FDB*, the port is put back to its original *VLAN* (for campus mode), and the port state is set to unauthenticated, if this was the last authenticated MAC on this port.

Example

The following command resets the Network Login session for the supplicant with the MAC address of 00:e0:18:01:32:1f:

```
clear netlogin state mac-address 00:e0:18:01:32:1f
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear network-clock gptp counters

```
clear network-clock gptp ports counters {ports [port_list | all]}
```

Description

Clears gPTP port counters.

Syntax Description

gptp	IEEE 802.1AS Generalized Precision Time Protocol.
counters	gPTP port counters.

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

N/A.

Usage Guidelines

Use this command to clear gPTP port counters. The command `clear counters` also clears the gPTP port counters (along with all other counters).

Example

```
clear network-clock gptp counters
clear network-clock gptp counters ports 2-4
clear network-clock gptp counters ports all
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all platforms if the AVB feature pack license is installed on the switch.

clear nodealias

`clear` **`nodealias`** { **`ports`** [*port_list* | **`all`**] | **`alias-id`** *alias_id* }

Description

This command clears alias entries out of the Node Alias feature database. You can clear information by specified port(s) or alias ID. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
ports	Designates that you want to clear node alias information for the selected ports.
port_list	Specifies from which ports to clear node alias information. Designated as a port list separated by comma (,) or dash (-).
all	Clears node alias information from all ports.

alias-id	Designates that you want to clear node alias information for the specified alias ID from all ports.
alias_id	Specifies the alias ID that you want information cleared for from the database.

Default

None.

Usage Guidelines

If the port is part of a *LAG (Link Aggregation Group)*, this command is only allowed on the master port.

Example

The following example clears all node alias entries on port 7:

```
clear nodealias ports 7
```

The following example clear node alias entries for alias ID 716168949 from all ports:

```
clear nodealias alias-id 716168949
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ospf counters

```
clear ospf counters { interfaces [all | vlan vlan_name | area area-
   identifier] | area [all | area-identifier] | virtual-link [all |
   router-identifier area-identifier] | neighbor [all | routerid [ip-
   address {ip-mask} | ipNetmask] | vlan vlan_name]| system}
```

Description

Clears the *OSPF (Open Shortest Path First)* counters (statistics).

Syntax Description

vlan_name	Specifies a *VLAN* name.
router-identifier	Specifies a router interface number.
area-identifier	Specifies an OSPF area.

ip-address	Specifies an IP address
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
system	Specifies the OSPF system counters.

Default

N/A.

Usage Guidelines

The global command clear counters also clears all OSPF counters. This global command is the equivalent of clear ospf counters for OSPF.

Example

The following command clears the OSPF counters for area 1.1.1.1:

```
clear ospf counters area 1.1.1.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear ospfv3 counters

```
clear ospfv3 counters {interfaces [[vlan | tunnel] all | {vlan} vlan-
   name | {tunnel} tunnel-name | area area-identifier] | virtual-link
   [all | {routerid} router-identifier {area} area-identifier]}
```

Description

Clears the *OSPFv3 (Open Shortest Path First version 3)* counters (statistics).

Syntax Description

all	Specifies all *VLAN*s, tunnels, areas, neighbors, or virtual-links.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.

router-identifier	Specifies a router identifier, a four-byte, dotted decimal number.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

The global command clear counters also clears all OSPFv3 counters. This global command is the equivalent of clear ospfv3 counters for OSPFv3.

This command can be used to clear various OSPFv3 counters (Interface, Area, Virtual-Link, System etc.). The following is the list of various counters that would be reset to zero by this command:

- Neighbor specific counters:
  - Number of state changes.
  - Number of events.
- Interface/VLAN/Virtual-link/Tunnel specific counters:
  - Hellos Rxed
  - Hellos Txed
  - DB Description Rxed
  - DB Description Txed
  - LSA Request Rxed
  - LSA Request Txed
  - LSA Update Rxed
  - LSA Update Txed
  - LSA Ack Rxed
  - LSA Ack Txed
  - In Discards

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear pim cache

```
clear pim {ipv4 | ipv6} cache {group_addr {source_addr}}
```

Description

Clears PIM multicast cache table.

Syntax Description

ipv4	Specifies an IPv4 address.
ipv6	Specifies an IPv6 address.
group_addr	Specifies a group address.
source_addr	Specifies a source IP address.

Default

If no options are specified, all PIM cache entries are flushed.

Usage Guidelines

This command can be used by network operators to manually remove IPMC software and hardware forwarding cache entries instantly. If the stream is available, caches are re-created; otherwise, caches are removed permanently. This command can disrupt the normal forwarding of multicast traffic.

Example

The following example resets the IP multicast table for group 224.1.2.3:

```
clear pim cache 224.1.2.3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear pim snooping

```
clear pim snooping {vlan} name
```

Description

Clears all PIM snooping neighbors, joins received on the *VLAN*, and the VLAN forwarding entries.

Syntax Description

name	Specifies the VLAN to which this command applies.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the PIM snooping database for the Default VLAN:

```
clear pim snooping "Default"
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

clear port rate-limit flood

```
clear port [all | port_list | port_group ] rate-limit flood out-of-
   profile {disabled-ports} {status | counter}
```

Description

This command clears the counter and/or status of ports of a flood rate-limiter that may have had their limit exceeded.

Syntax Description

port_list	Clears a port list.
port_group	Clears a port group.
all	Clears all ports.
out-of-profile	Clears only out-of-profile rate-limiters.
disabled-ports	Clears only ports that have been disabled due to out-of-profile status.
both	Clears out-of-profile status and counter for rate-limiter.

status	Clears only out-of-profile status for rate-limiter.
counter	Clear only out-of-profile counter for rate-limiter.

Default

All.

Usage Guidelines

The `clear ports rate-limit flood out-of-profile` command allows the clearing of the counter and/or status of ports of a flood rate-limiter that may have had their limit exceeded. For the entered ports, the status option removes the ports from the disabled port out-of-profile list, re-enables ports that may have been disabled due to out-of-profile rate-limit, and re-enables the syslog and traps for those ports as well. For the entered ports, the counter option resets the counters. If neither option is specified, both the status and counter will be cleared. If the **disabled-ports** option is specified, only the out-of-profile statuses that have disabled ports will be cleared. If no options are specified, all out-of-profile statuses will be cleared.

Example

```
clear ports all rate-limit flood out-of-profile
clear ports all rate-limit flood out-of-profile disabled-ports
clear ports fldGroupA rate-limit flood out-of-profile status
clear ports 1-24 rate-limit flood out-of-profile counter
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ports link-flap-detection counters

`clear` **`ports`** [*`port_list`* | **`all`**] **`link-flap-detection counters`**

Description

Clears the counters related to port link-flapping.

Syntax Description

ports	Physical ports.
port_list	List of ports that you want to clear the link flap counters on.

all	Selects all ports in the system to have their link-flap counters cleared.
counters	Counters related to link flapping.

Default

N/A

Example

The following example clears the link flap counters for ports 4 through 12:

```
clear ports 4-12 link-flap-detection counters
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear ports link-flap-detection status

clear **ports** [*port_list* | **all**] **link-flap-detection status**

Description

Manually enables ports that have been disabled due to excessive link-flapping.

Syntax Description

ports	Physical ports.
port_list	List of ports that you want to enable that were disabled due to excessive link flapping.
all	Enables all ports in the system that were disabled due to excessive link flapping.
status	Enable ports currently in disabled state due to excessive link flapping.

Default

N/A

Usage

Ports that have been disabled due to excessive link flapping cannot be enabled using the `enable port` command. They must be enabled using the `clear ports link-flap-detection status` command.

Example

The following example re-enables all ports on the switch that were disabled due to excessive link flapping:

```
clear ports all link-flap-detection status
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear port rate-limit flood

```
clear port [all | port_list | port_group ] rate-limit flood out-of-
   profile {disabled-ports} {status | counter}
```

Description

This command clears the counter and/or status of ports of a flood rate-limiter that may have had their limit exceeded.

Syntax Description

port_list	Clears a port list.
port_group	Clears a port group.
all	Clears all ports.
out-of-profile	Clears only out-of-profile rate-limiters.
disabled-ports	Clears only ports that have been disabled due to out-of-profile status.
both	Clears out-of-profile status and counter for rate-limiter.
status	Clears only out-of-profile status for rate-limiter.
counter	Clear only out-of-profile counter for rate-limiter.

Default

All.

Usage Guidelines

The `clear ports rate-limit flood out-of-profile` command allows the clearing of the counter and/or status of ports of a flood rate-limiter that may have had their limit exceeded. For the entered ports, the status option removes the ports from the disabled port out-of-profile list, re-enables ports that may have been disabled due to out-of-profile rate-limit, and re-enables the syslog and traps for those ports as well. For the entered ports, the counter option resets the counters. If neither option is specified, both the status and counter will be cleared. If the **disabled-ports** option is specified, only the out-of-profile statuses that have disabled ports will be cleared. If no options are specified, all out-of-profile statuses will be cleared.

Example

```
clear ports all rate-limit flood out-of-profile
clear ports all rate-limit flood out-of-profile disabled-ports
clear ports fldGroupA rate-limit flood out-of-profile status
clear ports 1-24 rate-limit flood out-of-profile counter
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear process group statistics

`clear process group` **`statistics`** {**`vital`** | **`other`**}

Description

This command clears the memory- and CPU-related statistics of "Vital" and/or “Other" (non-vital) groups.

Syntax Description

`statistics`	Designates clearing statistics for the process groups.
`vital`	Selects clearing statistics for the "vital" process group. If you make no selection, statistics for both groups are cleared.
`other`	Selects clearing statistics for the "non-vital" process group. If you make no selection, statistics for both groups are cleared.

Default

If you make no selection, statistics for both groups are cleared.

Example

The following example clears statistics for the "vital" group:

```
clear process group statistics vital
```

History

This command was first available in ExtremeXOS 22.2.

The **exos** option was removed in ExtremeXOS 31.5.

The **vital** option was first available in ExtremeXOS 31.5

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear rip counters

```
clear rip counters
```

Description

Clears the *RIP (Routing Information Protocol)* counters (statistics).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the RIP statistics counters:

```
# clear rip counters
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

clear ripng counters

```
clear ripng counters {vlan vlan-name | tunnel tunnel-name}
```

Description

Clears the *RIPng (Routing Information Protocol Next Generation)* global or interface-specific counters (statistics).

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the RIPng statistics counters:

```
clear ripng counters
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.ature-link-22.1"/>

clear screen

```
clear screen
```

Description

This command clears the screen of a login session with the termcaps-defined capability and returns the prompt to the top.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear session

```
clear session [history | sessId | all]
```

Description

Terminates a Telnet and/or SSH2 sessions from the switch.

Syntax Description

history	Clears the chronology of sessions that were opened.
sessId	Specifies a session number from show session output to terminate.
all	Terminates all sessions.

Default

N/A.

Usage Guidelines

An administrator-level account can disconnect a management session that has been established by way of a Telnet connection.

You can determine the session number of the session you want to terminate by using the `show session` command. The output of this command displays information about current Telnet and/or SSH2 sessions including:

- The session number.
- The login date and time.
- The user name.
- The type of Telnet session.
- Authentication information.

Depending on the software version running on your switch, additional session information may be displayed. The session number is the first number displayed in the `show session` output.

When invoked to the clear the session history, the command clears the information about all the previous sessions that were logged. The information about the active sessions remains intact.

Example

The following example terminates session 4 from the system:

```
clear session 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear slot

```
clear slot slot
```

Description

Clears a slot of a previously assigned module type.

Syntax Description

slot	Specifies the slot number.

Default

N/A.

Usage Guidelines

All configuration information related to the node and the ports on the switch is erased. If a node is present when you issue this command, the switch is reset to default settings.

If a node is configured for one type of switch, and a different type of switch is inserted in the stack, the inserted node is put into a mismatch state (where the inserted node does not match the configured node), and is not brought online. To use the new switch type in a node, the node configuration must be cleared or configured for the new switch type. Use the enable mirroring to port tagged command to configure the node.

Example

The following command clears node 2 of a previously assigned switch type:

```
clear slot 2
```

The following command clears slot 4 of a previously assigned switch type in a stack:

```
clear slot 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on SummitStacks.

clear snmp notification-log

```
clear snmp notification-log [counters | entries] { default | name hex
   hex_name}
```

Description

Clears entries and counters from a notification log.

Syntax Description

counters	Specifies to clear counters.
entries	Specifies to clear notification entries.
default	Optionally clear just the default log.
name	Optionally clear just the specified log.
hex	Provide value in hexadecimal.
hex_name	Optionally clear just the specified log (log name in hexadecimal).

Default

Disabled.

Usage Guidelines

Use this command to clear entries and counters from a notification log.

Example

The following example clears global counters:

```
clear snmp notification-log counters
```

The following example clears all entries from all logs:

```
clear snmp notification-log entries
```

The following example clears counters for the default log:

```
clear snmp notification-log counters default
```

The following example clears all entried from nmslog1:

```
clear snmp notification-log entries nmslog1
```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear stpd ports

clear stpd *stpd_name* **ports** *port_list* **protocol-migration**

Description

Resets the partner Spanning Tree Protocol version to the configured version.

Syntax Description

stpd_name	Specifies an *STPD (Spanning Tree Domain)* name on the switch.
port_list	Specifies the port list, which can be separated with a comma or a dash.
protocol-migration	Resets the partner protocol mode to configured mode.

Default

N/A

Usage Guidelines

STP detects the spanning tree version on a network and sends out the equivalent BPDU. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), Protocol Migration feature supports the forcefully allowing the user to choose the version, where a switch supporting *MSTP (Multiple Spanning Tree Protocol)* is forced to behave as STP or RSTP.

For example, three bridges on shared media, two of are configured dot1w (RSTP) and one is dot1d (legacy STP) mode

These bridges will transmit STP BPDUs on their connected ports since one of the peers is in dot1d mode. If the dot1d mode configured bridge leaves this shared media the remaining two bridges will keep sending STP BPDUs even though they should use RTP BPDUs normally. By using this feature we can clear the STP BPDU transmission and starts sending the RSTP BPDUs.

Example

The following example resets the protocol migration for the port 1:10 in STP domain r1:

```
clear stpd r1 ports 1:10 protocol-migration
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear switch bluetooth

clear **switch bluetooth device** [**all** | *address*]

Description

Clears either all paired Bluetooth devices or a particular paired device.

Syntax Description

switch	Designates clearing switch information.
bluetooth	Designates clearing Bluetooth information.
device	Designates clearing Bluetooth devices.
all	Clears all Bluetooth devices.
address	Clears only the Bluetooth device at the specified MAC address.

Default

N/A.

Usage Guidelines

To clear all paired Bluetooth devices, use the **all** option.

To clear only a specific device, use the *address* option. To find the address of a specific Bluetooth device, use the `show` **switch bluetooth** [**statistics** | **inventory**] command without the **statistics** option.

To enable Bluetooth capabilites, use the `enable` **switch bluetooth** {**discovery** | **pairing** } command.

Example

The following example clears all Bluetooth devices:

```
# clear switch bluetooth device all
```

The following example clears the Bluetooth device at address 00:04:96:9a:46:48:

```
# clear switch bluetooth device 00:04:96:9a:46:48
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

clear vm storage

`clear` **vm storage**

Description

Formats the virtual machine (VM) storage module (SSD) for use.

Syntax Description

vm	Designates a virtual machine.
storage	Specifies formatting disk storage (VM storage module) for use by VMs.

Default

N/A.

Usage Guidelines

None.

Example

The following example formats VM storage:

```
# clear vm storage
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on all platforms that support the Integrated Application Hosting (IAH) feature and have a Core or Premier license installed. For a list of platforms that support the IAH feature and for information about licenses, see the *Switch Engine 32.2 Feature License Requirements*.

clear vlan dhcp-address-allocation

```
clear vlan vlan_name dhcp-address-allocation [[all {offered | assigned |
   declined | expired}] | ipaddress]
```

Description

Removes addresses from the *DHCP* allocation table.

Syntax Description

vlan_name	Specifies the *VLAN* of the DHCP server.
all	Specifies all IP addresses, or all IP addresses in a particular state.
offered	Specifies IP addresses offered to clients.
assigned	Specifies IP addresses offered to and accepted by clients.
declined	Specifies IP addresses declined by clients.
expired	Specifies IP addresses whose lease has expired and not renewed by the DHCP server.
ipaddress	Specifies a particular IP address.

Default

N/A.

Usage Guidelines

You can delete either a single entry, using the IP address, or all entries. If you use the all option, you can additionally delete entries in a specific state.

Example

The following command removes all the declined IP addresses by hosts on the VLAN temporary:

```
clear vlan temporary dhcp-address-allocation all declined
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list

```
configure access-list aclname [any | ports port_list | vlan vlan_name]
   {ingress | egress}
```

Description

Configures an access list to the specified interface.

Syntax Description

aclname	Specifies the *ACL* policy file name.
any	Specifies that this ACL is applied to all interfaces as the lowest precedence ACL.
port_list	Specifies the ingress or egress port list on which the ACL is applied.
vlan_name	Specifies the *VLAN* on which the ACL is applied.
ingress	Apply the ACL to packets entering the switch on this interface.
egress	Apply the ACL to packets leaving the switch from this interface. (ExtremeSwitching X460-G2, X670-G2, X440-G2, X465, X620 series switches only).

Default

The default direction is ingress.

Usage Guidelines

The access list applied in this command is contained in a text file created either externally to the switch or using the edit policy command. The file is transferred to the switch using TFTP before it is applied to the ports. The ACL name is the file name without its ".pol" extension. For example, the ACL blocknetfour would be in the file blocknetfour.pol.

Specifying the keyword any applies the ACL to all the ports, and is referred to as the wildcard ACL. This ACL is evaluated for ports without a specific ACL applied to it, and is also applied to packets that do not match the ACL applied to the interface.

Example

The following command configures the ACL policy test to port 1:2 at ingress:

```
configure access-list test ports 1:2
```

The following command configures the ACL mydefault as the wildcard ACL:

```
configure access-list mydefault any
```

The following command configures the ACL policy border as the wildcard egress ACL:

```
configure access-list border any egress
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was first available in ExtremeXOS 11.0.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list action-resolution highest-priority

```
configure access-list action-resolution highest-priority
```

Description

This command puts user *ACL*s into "highest priority only" action resolution mode.

Syntax Description

This command has no arguments or variables.

Default

Multiple.

Usage Guidelines

Use this command to put user ACLs into "highest priority only" action resolution mode. All of the static policies and dynamic ACL rules that are installed after this command has been executed execute only the actions of the highest priority rule that has being matched, even if there are matches in the lower priority virtual slices with non-conflicting actions. This behavior is achieved by putting all virtual slices used by user ACLs into the same virtual group. However, all the policies and dynamic ACL rules that were installed prior to the execution of this command would stay in their separate virtual groups. As a result of this, the rules installed prior to the execution of this command will execute non- conflicting actions from the matches in lower priority virtual slices in addition to executing all the actions of the highest priority match. If a save and reboot was done after this command has being executed, all static policies and dynamic ACL rules will operate in "highest priority only" action resolution mode.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list action-resolution multiple

```
configure access-list action-resolution multiple
```

Description

This command puts user *ACL*s into "multiple matches" action resolution mode. All the static policies and dynamic ACL rules that are installed after this command is entered would execute all the actions of the highest priority rule that has being matched as well as all non conflicting actions from the matches in the lower priority virtual slices.

Syntax Description

This command has no arguments or variables.

Default

Multiple.

Usage Guidelines

Use this command to put user ACLs into "multiple matches" action resolution mode. All the static policies and dynamic ACL rules that are installed after this command is entered would execute all the

actions of the highest priority rule that has been matched as well as all non-conflicting actions from the matches in the lower priority virtual slices.

This behavior is achieved by putting all virtual slices used by user ACLs into separate virtual groups. However, all the policies and dynamic ACL rules that were installed prior to the execution of this command would stay in their old single virtual group. As a result, the rules installed prior to the execution of this command will execute only the actions of the highest priority match. If the save and reboot was done after this command has being executed, all static policies and dynamic ACL rules will operate in "multiple matches" action resolution mode. "Multiple matches" is the default mode on the switch, and if none of action-resolution commands has being executed the switch will operate in "multiple matches" resolution mode.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list add

```
configure access-list add dynamic_rule [ [[first | last] {priority
   p_number} {zone zone} ] | [[before | after] rule] | [ priority
   p_number {zone zone} ]] [ any | vlan vlan_name | ports port_list ]
   {ingress | egress}
```

Description

Configures a dynamic *ACL* rule to the specified interface and sets the priority and zone for the ACL.

Syntax Description

dynamic_rule	Specifies a dynamic ACL rule.
first	Specifies that the new dynamic rule is to be added as the first rule.
last	Specifies that the new dynamic rule is to be added as the last rule.
priority	Priority of rule within a zone.
p_number	Specifies the priority number of the rule within a zone. The range is from 0 (highest priority) to 7 (lowest priority).
zone	Specifies the ACL zone for the rule.
before *rule*	Specifies that the new dynamic rule is to be added before an existing dynamic rule.
after *rule*	Specifies that the new dynamic rule is to be added after an existing dynamic rule.
any	Specifies that this ACL is applied to all interfaces.
vlan_name	Specifies the *VLAN* on which this ACL is applied.

port_list	Specifies the ports on which this ACL is applied.
ingress	Apply the ACL to packets entering the switch on this interface.
egress	Apply the ACL to packets leaving the switch from this interface.

Default

The default direction is ingress.

Usage Guidelines

The dynamic rule must first be created before it can be applied to an interface. Use the following command to create a dynamic rule:

`create access-list` *`dynamic-rule conditions actions`* {**`non-permanent`**}

When a dynamic ACL rule is applied to an interface, you will specify its precedence among any previously applied dynamic ACLs. All dynamic ACLs have a higher precedence than any ACLs applied through ACL policy files.

Specifying the keyword any applies the ACL to all the ports, and is referred to as the wildcard ACL. This ACL is evaluated for ports without a specific ACL applied to them, and is also applied to packets that do not match the ACL applied to the interface.

The priority keyword can be used to specify a sub-zone within an application's space. For example, to place ACLs into three sub-zones within the CLI application, you can use three priority numbers, such as 2, 4, and 7.

Configuring priority number 1 is the same as configuring first priority. Configuring priority number 8 is the same as configuring last priority.

Example

The following command applies the dynamic ACL icmp-echo as the first (highest precedence) dynamic ACL to port 1:2 at ingress:

```
configure access-list add icmp-echo first ports 1:2
```

The following command applies the dynamic ACL udpdacl to port 1:2, with a higher precedence than rule icmp-echo:

```
configure access-list add udpacl before icmp-echo ports 1:2
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list delete

```
configure access-list delete ruleName [ any | vlan vlan_name | ports
   port_list | all] {ingress | egress}
```

Description

Removes a dynamic *ACL* rule from the specified interface.

Syntax Description

ruleName	Specifies a dynamic ACL rule name.
any	Deletes this ACL as the wildcard ACL.
vlan_name	Specifies the *VLAN* on which this ACL is deleted.
port_list	Specifies the ports on which this ACL is deleted.
all	Deletes this ACL from all interfaces.
ingress	Deletes the ACL for packets entering the switch on this interface.
egress	Deletes the ACL for packets leaving the switch from this interface.

Default

The default direction is ingress.

Usage Guidelines

Specifying the keyword all removes the ACL from all interfaces it is used on.

Example

The following command removes the dynamic ACL icmp-echo from the port 1:2:

```
configure access-list delete icmp-echo ports 1:2
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list network-zone

```
configure access-list network-zone zone_name [add | delete] [mac-address
   macaddress {macmask} | ipaddress [ipaddress {netmask} | ipNetmask |
   ipv6_address_mask]]
```

Description

Adds or removes IP and MAC addresses to and from the network-zone.

Syntax Description

network-zone	Logical group of remote devices.
zone_name	Specifies the network-zone name.
add	Adds a logical group of entities to the network-zone.
delete	Deletes a logical group of entities to the network-zone.
mac-address	MAC address.
macaddress	Specifies the MAC address to be added/removed to/from the network-zone.
macmask	Specifies the MAC Mask. Example FF:FF:FF:00:00:00.
ipaddress	Specifies IPv4 address.
ipaddress	Specifies the IP address.
netmask	Specifies IP netmask.
ipNetmask	Specifies the IP address/Netmask.
ipv6_address_mask	Specifies IPv6 address/IPv6 prefix length.

Default

N/A.

Usage Guidelines

Use this command to to add or remove IP/MAC addresses to/from the network-zone.

Example

The following command adds an IPv6 IP address to network-zone “zone1”:

```
Switch# configure access-list network-zone zone1 add ipaddress
11.1.1.1/32
```

If you try to add the same IP/MAC with the same or narrow mask, the configuration is rejected, with the following error message.

```
Switch #configure access-list network-zone "zone1" add ipaddress 11.1.1.1/24
```

```
Error:  Network Zone "zone1" - Zone already has the same entity value with same or wider
mask.
```

If you try to add more than eight attributes to a network-zone, the following error message is printed.

```
Switch #configure access-list network-zone "zone1" add ipaddress 11.1.1.1/24
Error:  Network Zone "zone1" - Reached maximum number of attributes. Unable to add more.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list rule-compression port-counters

```
configure access-list rule-compression port-counters [shared |
   dedicated]
```

Description

Switches between *ACL* configuration modes.

Syntax Description

shared	Sharing is “on” for counter rules.
dedicated	Sharing is “off” for counter rules.

Default

Dedicated.

Usage Guidelines

Use this command to switch between two ACL configuration modes. In the first mode, “port-counters shared”, similar port-based ACL rules with counters are allowed to share the same hardware entry. This uses less space but provides an inaccurate counter value. In the second mode, “port-counters dedicated”, similar port-based ACL rules with counters are not allowed to share the same hardware entry, thereby consuming more entries but providing a precise count.

Only ACLs that are entered after this command is entered are affected. The command does not affect any ACLs that are already configured.

To configure all ACLs in shared mode, configure access-list rule-compression port-counters shared must be entered before any ACLs are configured or have been saved in the configuration when a switch is booted.

This is a global setting for the switch; that is, the option does not support setting some ACL rules with shared counters and some with dedicated counters.

To view the results of the configuration use the show access-list configuration command.

Example

The following command configures ACL rules with counters to share the same hardware entry:

```
configure access-list rule-compression port-counters shared
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list vlan-acl-precedence

```
configure access-list vlan-acl-precedence [dedicated | shared]
```

Description

Configures precedence mode for policy-file based *ACL*s that are applied on a *VLAN*.

Syntax Description

dedicated	Allocates exclusive precedence for VLAN-based ACLs.
shared	VLAN-based ACLs share the precedence with other ACLs.

Default

Dedicated.

Usage Guidelines

The following feature applies to only policy-file based ACLs that are applied on a VLAN. Use this command to switch between two VLAN-based ACL configuration modes. In the shared vlan-aclprecedence mode, VLAN-based ACL rules share the same precedence with other types of ACL rules and provides the same behavior as in the previous software releases. In the dedicated vlan-acl-precedence mode, VLAN-based ACL rules have different precedence compared to other types of ACL rules and this is the default mode. The dedicated mode yields improved installation performance for VLAN based access-lists but may affect hardware rule utilization in some configurations.

After configuring, you are prompted to reboot the system for the changes to take effect.

Example

The following command allocates exclusive precedence for VLAN-based static ACL rules:

```
configure access-list vlan-acl-precedence dedicated
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list width

`configure access-list width [`**`double`** `|` **`single`**`] [`**`slot`** *`slotNo`* `|` **`all`**`]`

Description

Configures the TCAM width of a switch.

Syntax Description

`double`	Specifies a double wide *ACL* TCAM. Provides double wide ACL key with additional qualifiers.
`single`	Specifies a single wide ACL TCAM.
`slotNo`	Specifies the slot to configure.
`all`	Specifies all slots.

Default

Single.

Usage Guidelines

Note
This command is not applicable to the ExtremeSwitching X870 series switches. Key width is applied automatically on X870 switches.

Use this feature to configure the width of the ACL TCAM key of a slot or switch to be either double wide or single wide.

The switch must be rebooted for the configuration change to take effect.

If you attempt to configure a double wide mode on a slot or switch that does not support it, an error message is displayed.

To display the configured mode, use the show access-list width command.

Example

The following command configures slot 1 to use double wide mode:

```
# configure access-list width double slot 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure access-list zone

```
configure access-list zone name zone-priority number

configure access-list zone name move-application appl_name to-zone name
   application-priority number

configure access-list zone name {add} application appl_name
   application_priority number

configure access-list zone name delete application appl_name
```

Description

Configures the priority of a zone; moves an application from one zone to another at a specified priority; adds an application to a zone with a specified priority, or changes the priority of an application within a zone; deletes an application from a zone.

Syntax Description

name	Specifies a a zone name.
zone-priority *number*	Sets the priority of the zone.
move-application *appl_name*	Specifies the name of an application to be moved.
to-zone *name*	Specifies the zone to which the application is moved.
application-priority *number*	Sets the priority of the application within the zone. The range is from 0 (highest priority) to 7 (lowest priority).
add	Adds an application to a zone at a specified priority.
application *appl_name*	Specifies the application to be added to the zone.
application_priority number *number*	Sets the priority of a new or existing application within a zone. The range is from 0 (highest priority) to 7 (lowest priority).

Default

N/A.

Usage Guidelines

To configure the priority of a specific zone, use the syntax:

`configure access-list zone *name* zone-priority *number*`

To move an application from one zone to another, and set its priority in the new zone, use the syntax:

`configure access-list zone *name* move-application *appl-name* to-zone *name* application-priority *number*`

To add an application to a zone and specify its priority or to change the priority of an application within a zone, use the syntax:

`configure access-list zone *name* {**add**} application *appl-name* application_priority *number*`

To delete an application from a zone, use the syntax:

`configure access-list zone *name* delete application *appl-name*`

Example

The following command adds the CLI application to the zone myzone at a priority of 6:

```
configure access-list zone myzone add cli application-priority 6
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account

`configure account [**all** | *name*]`

Description

Configures a password for the specified account, either user account or administrative account.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.

Default

N/A.

Usage Guidelines

You must create a user or administrative account before you can configure that account with a password.

Use the `create account` command to create a user account.

The system prompts you to specify a password after you enter this command. You must enter a password for this command; passwords cannot be null and cannot include the following characters: “<“, “>”, and “?”.

Note

Once you issue this command, you cannot have a null password. However, if you want to have a null password (that is, no password on the specified account), use the `create account` command.

Passwords can have a minimum of 0 character and can have a maximum of 32 characters. Passwords are case-sensitive. User names are not case-sensitive.

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See `configure account password-policy char-validation` for more information.

You must have administrator privileges to change passwords for accounts other than your own.

Example

The following example defines a new password green for the account marketing:

```
configure account marketing
```

The switch responds with a password prompt:

```
password: green
```

Your keystrokes will not be echoed as you enter the new password. After you enter the password, the switch will then prompt you to reenter it:

```
Reenter password: green
```

Assuming you enter it successfully a second time, the password is now changed.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account encrypted

```
configure account [all | name] encrypted e-password
```

Description

Encrypts the password that is entered in plain text for the specified account, either user account or administrative account.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
e-password	Enter in plain text the string you for an encrypted password. See Usage Guidelines for more information.

Default

N/A.

Usage Guidelines

You must create a user or administrative account before you can configure that account with a password.

Use the `create account` account command to create a user account.

When you use this command, the following password that you specify in plain text is entered and displayed by the switch in an encrypted format. Administrators should enter the password in plain text. The encrypted password is then used by the switch once it encrypts the plain text password. The encrypted command should be used by the switch only to show, store, and load a system-generated encrypted password in configuration; this applies with the following commands: `save configuration`, `show configuration`, and `use configuration`.

Note

Once you issue this command, you cannot have a null password. However, if you want to have a null password (that is, no password on the specified account), use the `create account` command.

Passwords can have a minimum of 0 character and can have a maximum of 32 characters. Passwords are case-sensitive. User names are not case-sensitive.

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See `configure account password-policy char-validation` for more information.

You must have administrator privileges to change passwords for accounts other than your own.

Example

The following command encrypts the password red for the account marketing:

```
configure account marketing encrypted red
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy char-validation

```
configure account [all | name] password-policy char-validation [none |
   all-char-groups]
```

Description

Requires that the user include an upper-case letter, a lower-case letter, a digit, and a symbol in the password.

Syntax Description

all	Specifies all users (and future users).
name	Specifies an account name.
none	Resets password to accept all formats.
all-char-groups	Specifies that the password must contain at least two characters from each of the four groups. Note: The password minimum length will be eight characters if you specify this option.

Default

N/A.

Usage Guidelines

This feature is disabled by default.

Once you issue this command, each password must include at least two characters of each of the following four types:

- Upper-case A-Z.
- Lower-case a-z.
- 0-9.
- !, @, #, $, %, ^, *, (,).

The minimum number of characters for these specifically formatted passwords is 8 characters and the maximum is 32 characters.

Use the none option to reset the password to accept all formats.

Example

The following example requires all users to use this specified format for all passwords:

```
configure account all password-policy char-validation all-char-groups
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy history

```
configure account [all | name] password-policy history [num_passwords |
   none]
```

Description

Configures the switch to verify the specified number of previous passwords for the account. The user is prevented from changing the password on a user or administrative account to any of these previously saved passwords.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
num_passwords	Specifies the number of previous passwords the system verifies for each account. The range is 1 to 10 passwords.
none	Resets the system to not remember any previous passwords.

Default

N/A.

Usage Guidelines

Use this command to instruct the system to verify new passwords against a list of all previously used passwords, once an account successfully changes a password.

The limit is the number of previous passwords that the system checks against in the record to verify the new password.

If this parameter is configured, the system returns an error message if a user attempts to change the password to one that is saved by the system (up to the configured limit) for that account; this applies to both user and administrative accounts. This also applies to a configured password on the default admin account on the switch.

The limit of previous passwords that the system checks for previous use is configurable from 1 to 10. Using the none option disables previous password tracking and returns the system to the default state of no record of previous passwords.

Example

The following command instructs the system to verify that the new password has not been used as a password in the previous 5 passwords for the account engineering:

```
configure account engineering password-policy history 5
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy lockout-on-login-failures

```
configure account [all | name] password-policy lockout-on-login-failures
   [on | off]
```

Description

Disables an account after the user has three consecutive failed login attempts.

Syntax Description

all	Specifies all users (and future users).
name	Specifies an account name.
on	Specifies an account name.
off	Resets the password to never lockout the user.

Default

N/A.

Usage Guidelines

If you are not working on SSH, you can configure the number of failed logins that trigger lockout, using the `configure cli max-failed-logins num-of-logins` command.

This command applies to sessions at the console port of the switch as well as all other sessions and to user-level and administrator-level accounts. This command locks out the user after 3 consecutive failed login attempts; the user's account must be specifically re-enabled by an administrator.

Using the off option resets the account to allow innumerable consecutive failed login attempts, which is the system default. The system default is that three failed consecutive login attempts terminate the particular session, but the user may launch another session; there is no lockout feature by default.

Note
The switch does not allow to lock out of at least one administrator account.

Example

The following command enables the account finance for lockout.

After three consecutive failed login attempts, the account is subsequently locked out:

```
configure account finance password-policy lockout-on-login-failures on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy lockout-time-period

```
configure account [all | name] password-policy lockout-time-period
   [num_mins | until-cleared]
```

Description

This command allows you to configure the lockout time period (ranging from one minute to one hour).

Syntax Description

all	Configure all accounts.
name	Configure a specific account name.
num_min	Number of minutes (1-60) account is locked after max-failed-logins, unless unlocked via `clear account name lockout`.
until-cleared	Account is locked after max-failed-logins until unlocked via `clear account name lockout`.

Default

Until-cleared.

Usage Guidelines

Use this command to configure the lockout time period (ranging from one minute to one hour. Note that fail safe and admin accounts will also be locked out if lockout time period is specified. If there is more than one admin account, admin will be locked out even if the lockout time period is set to indefinite.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy max-age

```
configure account [all | name] password-policy max-age [num_days | none]
```

Description

Configures a time limit for the passwords for specified accounts. The passwords for the default admin account and the failsafe account do not age out.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
num_days	Specifies the length of time that a password can be used. The range is 1 to 365 days.
none	Resets the password to never expire.

Default

N/A.

Usage Guidelines

The passwords for the default admin account and the failsafe account never expire.

The time limit is specified in days, from 1 to 365 days. Existing sessions are not closed when the time limit expires; it will not open the next time the user attempts to log in.

When a user logs into an account with an expired password, the system first verifies that the entered password had been valid prior to expiring, and then prompts the user to change the password.

Note
This is the sole time that a user with a user-level (opposed to an administrator-level) account can make any changes to the user-level account.

Using the **none** option prevents the password for the specified account from ever expiring (it resets the password to the system default of no time limit).

To set a minimum lifespan for passwords, use the `configure account [all | name] password-policy min-age [num_days | none]` command.

In the case of conflicting settings between these two commands, a setting requiring a password change overrides a setting that prohibits a password change. For example, if **max-age** is set to 10 days, thus requiring a password change in 10 days, and a **min-age** is set to 20 days, attempting to forbid a password change until 20 days, the configuration to change the password after 10 days takes precedence over the configuration to not change the password for 20 days.

To view the current selection for the maximum lifespan for passwords, use the `show accounts password-policy` command.

Example

The following command sets a 3-month time limit for the password for the account marketing:

```
# configure account marketing password-policy max-age 90
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy min-age

`configure account [`**`all`**` | `*`name`*`] `**`password-policy min-age`**` [`*`num_days`*` | `**`none`**`]`

Description

Configures a minimum password lifespan.

Syntax Description

all	Applies the configuration to all accounts.
name	Applies the configuration to the account of the specified name.
password-policy	Specifies configuring the account password policy.
min-age	Specifies the minimum lifespan of passwords.
num_days	Specifies a minimum lifespan of passwords in days. Range is 1 to 365 days.
none	Specifies no limitation on the minimum lifespan for passwords (default).

Default

The default is no minimum lifespan for passwords.

Usage Guidelines

Similar to the `configure account [`**`all`**` | `*`name`*`] `**`password-policy max-age`**` [`*`num_days`*` | `**`none`**`]` command, which requires a password change after a configurable number of days, this command configures a lifespan, or minimum age. Having a minimum lifespan ensures that multiple password changes are not made in quick succession.

In the case of conflicting settings between these two commands, a setting requiring a password change overrides a setting that prohibits a password change. For example, if **max-age** is set to 10 days, thus requiring a password change in 10 days, and a **min-age** is set to 20 days, attempting to forbid a password change until 20 days, the configuration to change the password after 10 days takes precedence over the configuration to not change the password for 20 days.

To view the current selection for the minimum lifespan for passwords, use the `show accounts password-policy` command.

Example

The following example sets a minimum lifespan of 10 days for all accounts:

```
# configure account all password-policy min-age 10
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy min-different-characters

configure account [**all** |*name*] **password-policy min-different-characters** [*count*]

Description

When changing a password, configures the number of characters in the revised password that must be changed from the existing password.

Syntax Description

all	Applies the configuration to all accounts.
name	Applies the configuration to the account of the specified name.
password-policy	Specifies configuring the account password policy.
min-different-characters	Specifies the minimum number of different characters between a previous and new password.
count	Specifies the number of characters required to be different between the previous and new password. The range is 0–16. The default is 0.

Default

The default for the minimum number of different characters is 0.

Usage Guidelines

This command allows you to configure a variable number of characters that must be changed from the existing password when a new password is created. If the new password is longer than the original password, the “extended” characters of the new password are counted as different from the prior password. If the new password is shorter than the existing password, only the new password characters determine the number of characters that are different.

For example, if you specify 8 for the number of characters that must be different:

This combination would count as 9 different characters, and would pass:

- Current password: MyChoice
- New password: MyChoiceButLonger

This combination would count as zero different characters, and would fail:

- Current Password: MyChoiceButLonger
- New password: MyChoice

To view the current selection for the minimum number of different characters for changed passwords, use the `show accounts password-policy` command.

Example

The following example configures the minimum number of different characters for changed passwords to be "3" for all accounts:

```
# configure account all password-policy min-different-characters 3
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account password-policy min-length

```
configure account [all | name] password-policy min-length
   [num_characters | none]
```

Description

Requires a minimum number of characters for passwords.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.

num_characters	Specifies the minimum number of characters required for the password. The range is 1–32 characters. Note: If you configure the `configure account password-policy char-validation` parameter, the minimum length is eight characters.
none	Resets password to accept a minimum of 0 characters. Note: If you configure the `configure account encrypted` parameter, the minimum length is eight characters.

Default

N/A.

Usage Guidelines

Use this command to configure a minimum length restriction for all passwords for specified accounts.

This command affects the minimum allowed length for the next password; the current password is unaffected.

The minimum password length is configurable from 1–32 characters. Using the none option disables the requirement of minimum password length and returns the system to the default state (password minimum is 0 by default).

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See `configure account password-policy char-validation` for more information.

Example

The following command requires a minimum of 8 letters for the password for the account management:

```
configure account management password-policy min-length 8
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure account privilege

```
configure account [all | name] privilege [admin | user]
```

Description

Changes the privileges of an existing user account.

Syntax Description

account	Login account.
all	Specifies all accounts.
name	Specifies a specific user account.
privilege	Change the account privilege.
admin	Administrative privilege.
user	User (non-administrative) privilege.

Default

None.

Usage Guidelines

If an account is changed, any sessions that are currently logged in with that account are cleared, and therefore forced to login again with the new privilege. If the specified account is logged in to a session that cannot be cleared, an error message appears. If the account privilege is not changed by the option selected in the command for the specified acount(s) (account already has that privilege), the request is ignored and any sessions logged in with the account are not cleared.

If you attempt to remove administrative privileges from the sole account having administrative privilege, you receive an error message.

Example

The following example adds administrative privilege to an account called "my_name":

```
configure account my_name privilege admin
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering oneconfig bootprelay

configure **auto-peering one-config bootprelay** [**add** | **delete**] [*ip_address* | *ipv6_address*] **vr** *vrname*

Description

For Auto-peering, adds dynamic BOOTP relay servers that the DHCP relay agent uses to forward DHCP traffic received from host attachments.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
bootprelay	Specifies configuring dynamic BOOTP relay service applied to dynamically created VRFs.
add	Adds dynamic BOOTP relay server.
delete	Deletes dynamic BOOTP relay server.
ip_address	Specifies the IPv4 address of the BOOTP relay server.
ipv6_address	Specifies the IPv6 address of the BOOTP relay server.
vr	Specifies selecting the virtual router (VR) If you do not specify a VR or VRF, the current VR context is used.
vrname	Specifies the VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Dynamic BOOTP relay services are configured after the dynamic VRF is installed on the device.

Example

The following example adds dynamic BOOTP relay server at "50.1.101.105" for VR "red":

```
# configure auto-peering oneconfig bootprelay add 50.1.101.105 vr red
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering oneconfig id

configure **auto-peering one-config id** [**none** | *id*]

Description

Configures the ID used by each device when automatically forming an adjacency with an BGP Auto-peering neighbor.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
id	Specifies configuring the BPG Auto-peering ID that devices advertise to neighbors.
none	Removes the current ID.
id	Specifies the ID.

Default

N/A.

Usage Guidelines

All devices in an Auto-peering cluster have the same ID. Neighbors with different IDs must match the Remote ID table.

Example

The following example configures the ID as "123":

```
# configure auto-peering one-config id 123
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering one-config iproute

```
configure auto-peering one-config iproute [add | delete] [host | hostv6]
   [[ipaddress {netmask} | ipNetmask] gateway | ipNetmaskv6 gatewayv6]
   {vr vrname }
```

Description

Configures a list of OneConfig dynamic Auto-peering static routes.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
iproute	Specifies configuring the dynamic IP route configured when the host IP address attaches to the device.
add	Adds route.
delete	Deletes routes.
host	Specifies the IPv4 host address.
hostv6	Specifies the IPv6 host address.
ipaddress	Specifies the IPv4 address.
netmask	Specifies the IPv4 netmask.
ipNetmask	Specifies the IPv4 netmask/mask.
gateway	Specifies the IPv4 gateway address.
ipNetmaskv6	Specifies the IPv6 address/netmask.
gatewayv6	Specifies the IPv6 gateway address.
vr	Specifies selecting the virtual router (VR) If you do not specify a VR or VRF, the current VR context is used.
vrname	Specifies the VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

The switch holds the static route in the dynamic database until the host attaches to the switch. The routes are applied in the route table when the host IP address is discovered on a local access port. They are removed when the host is no longer connected to the device. To see if the host routes are properly installed, use the `show iproute {ipv4} {priority | vlan vlan_name | permanent | ip_address netmask | summary} {multicast | unicast} {vr vrname}}` command.

Example

The following example adds the static IP route for host 50.1.102.101, IP/netmask 60.1.1.0/24, gateway 50.1.102.101 on VR "red":

```
# configure auto-peering oneconfig iproute add 50.1.102.101 60.1.1.0/24 50.1.102.101 vr
red
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering one-config nsi-id

```
configure auto-peering one-config nsi-id id type [nsi | vrf] [add
   | delete] [[ipaddress {netmask} | ipNetmask ] | ipNetmaskv6] {vr
   vrname }
```

Description

Specifies a list of OneConfig dynamic auto-peering services.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
nsi-id	Specifies setting the Network Service (NSI) ID for dynamic L3 configuration
id	Specifies the NSI ID.
type	Specifies configuring the NSI ID type.
nsi	Specifies NSI ID type as NSI.
vrf	Specifies NSI ID type as VRF.
add	Adds subnet.
delete	Deletes subnet.
ipaddress	Specifies the IP address.
netmask	Specifies the IP netmask.
ipNetmask	Specifies the IPv4 address/netmask.
ipNetmaskv6	Specifies IPv6 address/netmask
vr	Specifies selecting the virtual router (VR) If you do not specify a VR or VRF, the current VR context is used.
vrname	Specifies the VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

The configuration is held on each node and is inactive until a VLAN/NSI binding is made to a dynamic VLAN. After the NSI is discovered, the configuration associated with the NSI on the VLAN is applied. This consists of creating the VRF as needed, applying IPv4 and IPv6 prefixes, enabling Anycast IP, and enabling IP Forwarding on the mapped VLAN. The mechanism to assign VLAN to NSI mapping is done

by following methods: policy by RADIS, and Fabric Attach; the VXLAN virtual network and VNI/NSI is dynamically created by the VXLAN service.

Example

The following example configures an NSI ID "1000" for type "VRF" on VR "red":

```
# configure auto-peering one-config nsi 1000 type VRF add vr red
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering oneconfig overlay

configure **auto-peering one-config overlay** [**add** | **delete**] **server** [*address* | *addressv6*] {**type bgp-rr** } {**id** *id*} {**password** [**none** | {**encrypted**} *password*] }

Description

Configures the Auto-peering overlay service database entries.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
overlay	Specifies overlay database containing centralized EVPN information.
add	Overlay add server.
delete	Overlay delete server.
server	Specifies the server.
address	Specifies the IPv4 server address/
addressv6	Specifies the IPv6 server address/
type	Specifies the overlay database type.
bgp-rr	Specifies overlay database type BGP route reflector.
id	Specifies the configuring the overlay database ID.
id	Specifies the overlay database ID. • For BGP-RR—AS number. • For Redis—port number.
password	Specifies configuring the password for the overlay database.

none	Removes the current password.
encrypted	Specifies encrypted format for the password.
password	Specifies the password/secret key.

Default

N/A.

Usage Guidelines

The overlay database allows the VXLAN edge technologies to dynamically span across brown field networks. For BGP-RR the ID represents the AS number, and for Redis, it represents the port to connect to.

Example

The following example configures the overlay database of type BGP-RR at "50.1.133.105" with ID "2000":

```
# configure auto-peering oneconfig overlay add server 50.1.133.105 type BGP-RR id 2000
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering one-config password

```
configure auto-peering one-config password [none | {encrypted}
   tcpPassword]
```

Description

Configures the auto-peering TCP MD5 password devices will configure in the TCP MD5.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
password	Configures the password for Auto peering neighbors.
none	Removes the current password
encrypted	Specifies that the password is in encrypted format.
tcpPassword	Specifes the TCP MD5 password/secret-key.

Default

N/A.

Usage Guidelines

Changing auto peering password might cause peers to be disconnected if passwords do not match.

Example

The following example sets the password to "123":

```
# configure auto-peering one-config password 123
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure auto-peering one-config remote id

```
configure auto-peering one-config remote id [add | delete] id {password
   [none | {encrypted} tcpPassword]}
```

Description

Configures a list of unique values that identify the remote Auto-peering devices to which this device can also automatically form an adjacency.

Syntax Description

auto-peering	Specifies Auto-peering.
one-config	Specifies changing the BGP Auto-peering OneConfig configuration.
remote	Specifies a remote device connecting in the Auto-peering network.
id	Specifies configuring the BPG Auto-peering ID that devices advertise to neighbors.
add	Specifies adding a remote ID.
delete	Specifies deleting a remote ID.
id	Specifies the ID.
password	Configures the password for Auto peering neighbors.
none	Removes the current password
encrypted	Specifies that the password is in encrypted format.
tcpPassword	Specifies the TCP MD5 password/secret-key.

Default

N/A.

Usage Guidelines

Not specifying a password will result in unsecure peering. Remote ID neighbors can use MD5 passwords for neighboring security. The lower ID password is used.

Example

The following example adds the remote Auto-peering device with ID "2222" and sets the password as "123":

```
# configure auto-peering one-config remote id add 2222 password 123
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure automation edge connect/disconnect

`configure` **`automation edge`** [**`connect`** | **`disconnect`**] **`database`** *`database_name`*

Description

Connects or disconnects an Automation Edge remote *VXLAN (Virtual Extensible LAN)* network identifier (VNI)-device database.

Syntax Description

`automation`	Designates configuring Automation Edge VXLAN VNI-device database information.
`edge`	Designates configuring Automation Edge VXLAN VNI-device database information.
`connect`	Designates connecting to the specified database.
`disconnect`	Designates disconnecting from the specified database.
`database`	Designates connecting or disconnecting a database.
`database_name`	Sets the database name that you are connecting or disconnecting.

Default

N/A.

Usage Guidelines

To connect to another new database, an existing database must be disconnected first. To view the connected database, use the command `show` **`database`** *`database_name`*

Example

The following example connects the database "database1":

```
# configure automation edge connect database database1
```

The following example disconnects the database "database1":

```
# configure automation edge disconnect database database1
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure banner

```
configure banner {after-login | { before-login } { acknowledge } |
   before-login {acknowledge} save-to-configuration}
```

Description

Configures the banner string to be displayed for CLI screens.

Syntax Description

after-login	Specifies that a banner be displayed after login.
before-login	Specifies that a banner be displayed before login.
acknowledge	Require acknowledgement of the banner before login.
save-to-configuration	Save the before login banner to the configuration file as well as non-volatile memory.

Default

N/A.

Usage Guidelines

Use this command to configure two types of banners:

- A banner for a CLI session that displays before login.
- A banner for a CLI session that displays after login.

If no optional parameters are specified, the command defaults to configuring a banner that is displayed before the CLI session login prompt.

For each CLI session banner, you can enter up to 24 rows of 79-column text.

Press [Return] at the beginning of a line to terminate the command and apply the banner. To clear the banner, press [Return] at the beginning of the first line.

Note

The system does not wait for a keypress when you use SSH for access; this only applies to the serial console login sessions and Telnet sessions.

To disable the acknowledgement feature, use the `configure banner` command omitting the acknowledge parameter.

To display any configured banners, use the `show banner` command.

To unconfigure one or more configured banners, use the `unconfigure banner` command.

Example

The following example add the text "test" before the pre-login prompt:

```
# configure banner before-login
test

# logout
Do you wish to save your configuration changes to primary.cfg? (y/N)
Y
test

login:
# show banner

Before-Login banner:
test

Acknowledge: Disabled
Save to    : Non-volatile memory only

After-Login banner:
```

History

This command was first available in ExtremeXOS 10.1.

The acknowledge parameter was added in ExtremeXOS 11.5.

The after-login option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bfd vlan

```
configure bfd vlan vlan_name [{detection-multiplier multiplier}
   {receive-interval rx_interval} {transmit-interval tx_interval}]
```

Description

Configures BFD transmit (TX) and receive (RX) intervals and multipliers on the *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN.
multiplier	Specifies the detection multiplier. The range is 1 to 255.
rx_interval	Specifies the receive interval for control packets in milliseconds. The range is 100 to 4294967 ms. (3 to 4294967 ms if hardware assist is enabled).
tx_interval	Specifies the transmit interval for control packets in milliseconds. The range is 100 to 4294967 ms. (3 to 4294967 ms if hardware assist is enabled).

Default

The default value for RX and TX intervals is 1000 ms.

The default value for the detection-multiplier is 3.

Usage Guidelines

Use this command to configure BFD.

Use the `show bfd vlan` command to display the current settings.

Example

The following command configures a transmit and receive interval of 2000 ms and a detection multiplier of 2 on the VLAN vlan1:

```
# configure bfd vlan vlan1 detection-multiplier 2 receive-interval 2000 transmit-interval
2000
```

Receive interval of 0

An *rx_interval* value of 0 means that this system does not want to receive any periodic BFD Control packets. A system may transmit a value of 0 for the Required MinRX Interval to indicate that the remote system should send no packets.

```
# configure bfd vlan vlan1 detection-multiplier 2 receive-interval 0 transmit-interval
2000
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bfd vlan authentication

```
configure bfd vlan vlan_name authentication [none | simple-password
   {encrypted encrypted_password | password }]
```

Description

Configures authentication for BFD on a *VLAN*.

Syntax Description

vlan_name	Specifies the VLAN name.
none	Specifies that no authentication is to be used. (Default)
encrypted	Indicates that the password is already encrypted.
password	Specifies a simple password to use to authenticate.

Default

The authentication default is none.

Usage Guidelines

Use this command to configure authentication for BFD on a VLAN using a password or specify that none is required.

Use the `show bfd vlan` command to display the authentication setting.

The encrypted keyword is primarily for the output of the show configuration command, so that the password is not revealed in the command output. Do not use it to set the password

Example

The following command configures authentication using the password password:

```
# configure bfd vlan vlan1 authentication simple-password password
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bgp add aggregate-address

```
configure bgp add aggregate-address {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]} ipaddress/masklength
   {as-match | as-set} {summary-only} {advertise-policy policy}
   {attribute-policy policy}
```

Description

Configures a *BGP* aggregate route.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and mask length.
as-match	Generates autonomous system sequence path information (order of AS numbers in AS_PATH is preserved).
as-set	Generates autonomous system set path information (order of AS numbers in AS_PATH is not preserved).
summary-only	Specifies to send only aggregated routes to the neighbors.
advertise-policy	Specifies the policy used to select routes for this aggregated route.
attribute-policy	Specifies the policy used to set the attributes of the aggregated route.

Default

If no address family is specified, IPv4 unicast is the default.

N/A.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must

store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

Before you can create an aggregate route, you must enable BGP aggregation using the following command:

```
enable bgp aggregation
```

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

BGP supports overlapping routes. For example, you can configure both of the following aggregate addresses:

- 192.0.0.0/8
- 192.168.0.0/16

After you create an aggregate route, the aggregate route remains inactive until BGP receives a route with an IP address and mask that conforms to an aggregate route. When a conforming route is received, the aggregate route becomes active and is advertised to BGP neighbors. If the summary-only option is specified, only the aggregate route becomes active and is advertised. If the summary-only option is omitted, any conforming aggregate routes and the received route are advertised to BGP neighbors.

Example

The following command configures a BGP aggregate route:

```
configure bgp add aggregate-address 192.1.1.4/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for overlapping aggregate addresses was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6-BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp add confederation-peer sub-AS-number

```
configure bgp add confederation-peer sub-AS-number number
```

Description

Adds a sub-AS to a confederation.

Syntax Description

number	Specifies a sub-AS number of the confederation. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

Before you can add a sub-AS to a confederation on the switch, you must disable any *BGP* neighbor sessions that are configured with the same AS number as a remote AS number. To disable BGP neighbor sessions, use the following command:

```
disable bgp neighbor [remoteaddr | all]
```

Invoke the `configure bgp add confederation-peer sub-AS-number` command multiple times to add multiple sub-ASs.

IBGP requires networks to use a fully-meshed router configuration. This requirement does not scale well, especially when BGP is used as an interior gateway protocol. One way to reduce the size of a fully-meshed AS is to divide the AS into multiple sub-autonomous systems and group them into a routing confederation. Within the confederation, all BGP speakers in each sub-AS must be fully-meshed. The confederation is advertised to other networks as a single AS.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following example adds one sub-AS to a confederation using the ASPLAIN 4-byte AS number format:

```
configure bgp add confederation-peer sub-AS-number 65536
```

The following example adds one sub-AS to a confederation using the ASDOT 4-byte AS number format:

```
configure bgp add confederation-peer sub-AS-number 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp add network

```
configure bgp add network {address-family [ipv4-unicast | ipv4-multicast
   |ipv6-unicast | ipv6-multicast]} ipaddress/masklength {network-policy
   policy}
```

Description

Adds a network to be originated from this router.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and mask length.
policy	Name of policy to be associated with network export. Policy can filter and/or change the route parameters.

Default

If no address family is specified, IPv4 unicast is the default.

N/A.

Usage Guidelines

The network must be present in the routing table.

Using the export command to redistribute routes complements the redistribution of routes using the `configure bgp add network` command. The `configure bgp add network` command adds the route to *BGP* only if the route is present in the routing table. The `enable bgp export` command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command adds a network to be originated from this router:

```
configure bgp add network 192.1.1.16/32
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp as-display-format

```
configure bgp as-display-format [asdot | asplain]
```

Description

Configures the AS number format displayed in show commands.

Syntax Description

asdot	Specifies the ASDOT format.
asplain	Specifies the ASPLAIN format.

Default

N/A.

Usage Guidelines

The ASPLAIN and ASDOT formats are described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command selects the ASDOT 4-byte AS number format:

```
configure bgp as-display-format asdot
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp as-number

`configure bgp` **`AS-number`** *`number`*

Description

Changes the local AS number used by *BGP*.

Syntax Description

`number`	Specifies a local AS number. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

BGP must be disabled before the AS number can be changed.

This command applies to the current VR or VRF context.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command specifies a local AS number using the ASPLAIN 4-byte AS number format:

```
configure bgp AS-number 65551
```

The following command specifies a local AS number using the ASDOT 4-byte AS number format:

```
configure bgp AS-number 1.15
```

Note

To remove the configured bgp as-number, assign as-number value as 0, i.e. configure bgp AS-number 0.

The following command configures the BGP router ID:

```
configure bgp routerid
```

Note

To remove the configured bgp routerid, give routerid value as 0.0.0.0 i.e. configure bgp routerid 0.0.0.0.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp cluster-id

```
configure bgp cluster-id cluster-id
```

Description

Configures the local cluster ID.

Syntax Description

cluster-id	Specifies a 4 byte field used by a route reflector to recognize updates from other route reflectors in the same cluster. The range is 0 - 4294967295.

Default

N/A.

Usage Guidelines

BGP must be disabled before the cluster ID can be changed.

Used when multiple route reflectors are used within the same cluster of clients.

Example

The following command appends a BGP route reflector cluster ID to the cluster list of a route:

```
configure bgp cluster-id 40000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp confederation-id

`configure bgp` **`confederation-id`** *`confederation-id`*

Description

Specifies a *BGP* routing confederation ID.

Syntax Description

confederation-id	Specifies a routing confederation identifier, which is a 4-byte AS number in the range of 1 to 4,294,967,295.

Default

N/A.

Usage Guidelines

IBGP requires that networks use a fully-meshed router configuration. This requirement does not scale well, especially when BGP is used as an interior gateway protocol. One way to reduce the size of a fully-meshed AS is to divide the AS into multiple sub-autonomous systems and group them into a routing confederation. Within the confederation, each sub-AS must be fully-meshed. The confederation is advertised to other networks as a single AS.

The confederation ID is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

BGP must be disabled before the confederation ID can be changed.

Use a confederation ID of 0 to indicate no confederation. You cannot unconfigure the confederation ID while confederation peers are configured. You must delete the confederation peers before you unconfigure the confederation ID.

Example

The following command specifies a BGP routing confederation ID using the ASPLAIN 4-byte AS number format:

```
configure bgp confederation-id 65551
```

The following command specifies a BGP routing confederation ID using the ASDOT 4-byte AS number format:

```
configure bgp confederation-id 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp delete aggregate-address

```
configure bgp delete aggregate-address {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast]} [ ipaddress/
   masklength | all]
```

Description

Deletes one or all *BGP* aggregated routes.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and netmask length.
all	Specifies all aggregated routes in the specified address family. If you do not specify an address family, all aggregated routes in all address families are deleted.

Default

N/A.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command deletes a BGP aggregate route:

```
configure bgp delete aggregate-address 192.1.1.4/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp delete confederation-peer sub-AS-number

```
configure bgp delete confederation-peer sub-AS-number number
```

Description

Specifies a sub-AS that should be deleted from a confederation.

Syntax Description

sub-AS-number	Specifies a sub-AS.

Default

N/A.

Usage Guidelines

Before you can change the configuration with this command, you must disable the *BGP* neighbors in the confederation using the following command:

```
disable bgp neighbor [remoteaddr | all]
```

Example

The following command deletes a sub-AS from a confederation using the ASPLAIN 4-byte AS number format:

```
configure bgp delete confederation-peer sub-AS-number 65551
```

The following command deletes a sub-AS from a confederation using the ASDOT 4-byte AS number format:

```
configure bgp delete confederation-peer sub-AS-number 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp delete network

```
configure bgp delete network {address-family [ipv4-unicast | ipv4-
   multicast |ipv6-unicast | ipv6-multicast]} [all | ipaddress/
   masklength]
```

Description

Deletes a network to be originated from this router.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
all	Specifies all networks for the specified address family. If no address family is specified, all networks for all address families are deleted.
ipaddress/masklength	Specifies an IP network address and netmask length.

Default

N/A.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command deletes a network to be originated from this router:

```
configure bgp delete network 192.1.1.12/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 *BGP*.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp evpn ignore-as

```
configure bgp evpn ignore-as [on | off]
```

Description

Configures treatment of the antonymous system (AS) part of the route target.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
ignore-as	Configure treatment of the AS part of the route target.
on	Specifies that route target matching ignore the AS part of the route target (default).
off	Specifies that route target matching not ignore the AS part of the route target.

Default

By default, route target matching ignores the AS part of the route target.

Usage Guidelines

To view the current setting for ignore-as, use the `show bgp evpn` command.

Example

The following example configures route target matching to ignore the AS as part of the route target:

```
# configure bgp evpn ignore-as on
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp evpn instance rd

```
configure bgp evpn instance evpn_instance_name rd [rd_value | auto]
```

Description

Configures route distinguishers for an EVPN instance.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
instance	Specifies configuring an EVPN instance
evpn_instance_name	Specifies name of the EVPN instance.
rd	Specifies configuring route distinguisher.
rd_value	Route distinguisher in format <admin>:<assigned number>.
auto	Specifes auto-derived route distinguisher values (default).

Default

By default, auto-derived route distinguisher values are used.

Example

The specifies auto-derived route distinguisher values for the EVPN instance "my_evpn":

```
 # configure bgp evpn instance my_evpn rd auto
Warning: Changing RD value for EVPN instance my_evpn from  to 'auto calculated' instance
will be reset
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp evpn instance route-target

```
configure bgp evpn instance evpn_instance_name route-target {import |
   export | both} [add | delete] route_target
```

Description

Configures route targets for an EVPN instance.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
instance	Specifies configuring an EVPN instance
evpn_instance_name	Specifies name of the EVPN instance.
route-target	Designates setting the route target association. Default is autoderived import and export.
import	Selects import route target.
export	Selects export route target.
both	Specifies import and export route target mode (default).
add	Adds a route target.
delete	Deletes a route target.
route_target	Route target in format <global-admin-value>:<local-admin-value>.

Default

By default, if you do not specify route target, then the auto-derived values are used.

If you do not specify, import and export route target mode applies

Usage Guidelines

For EBGP applications of EVPN, the auto-derived values will not match between BGP peers since local autonomous system (AS) is used in the derivation, and these differ between EBGP peers.

Note that the route target mode (import, export, or both) is automatically adjusted depending on configuration. For example, if an “import” target exists and you add an “export” target for the same value, the mode is automatically changed to “both”. Similarly, an entry can be deleted by mode. For example, if an entry has mode of “both” and you delete the “import” target of the same value, the entry is not deleted, instead its mode is changed to “export”. An attempt to delete an entry that does not exist (value or mode) produces an error message and no action is taken. For example, if you attempt to delete a route target using “both”, but the configured entry was only configured as “import” an error message appears, and no action is taken.

Example

The following example configures for instance "my_evpn" route target both mode:

```
# configure bgp evpn instance my_evpn route-target both
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp evpn instance vxlan

```
configure bgp evpn instance evpn_instance_name vxlan vni [vni_value |
   none]
```

Description

Adds or deletes a virtual extensible local area network (VXLAN) virtual network identifier (VNI) to an EVPN instance.

Syntax Description

bgp	BGP capability.
evpn	EVPN protocol.
instance	Specifies configuring an EVPN instance
evpn_instance_name	Specifies name of the EVPN instance.
vxlan	Specifies termination.
vni	Specifies adding a VXLAN VNI to an EVPN instance.
vni_name	Specifies the VNI (range = 1–16,777,215).
none	Removes existing VNI setting for this EVPN instance.

Default

N/A.

Example

The following example adds the VXLAN VNI "12345" to an EVPN instance named "my_evpn":

```
# configure bgp evpn instance my_evpn vxlan vni 12345
```

The following example removes the existing VXLAN VNI associated with the EVPN instance named "my_evpn":

```
# configure bgp evpn instance my_evpn vxlan vni none
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp evpn l3vni

`configure` **`bgp evpn l3vni`** [*vni_value* | **`none`**] **`vr`** *vr_name*

Description

Configures a Layer 3 virtual network identifier (VNI) and binds it to a VPN virtual router interface (VRF).

Syntax Description

bgp	Specifies changing the BGP configuration.
evpn	Specifies changing the EVPN configuration.
l3vni	Specifies changing the integrated routing and bridging IP VRF VNI configuration.
vni_value	Sets the VNI to a value between 1 and 16,777,215.
none	Removes an existing VNI setting for this EVPN L3VNI.
vr	Specifies binding the VNI to a VRF.
vr_name	Sets the VRF name.

Default

N/A.

Example

The following example binds VNI 100 to VRF "vrf1":

```
# configure bgp evpn l3vni 100 vr vrf1
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp export shutdown-priority

```
configure bgp export route_type {{address-family} address_family}
   shutdown-priority number
```

Description

Configures the shutdown priority for IGP export.

Syntax Description

route_type	Specifies the *BGP* export route type.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
number	Specifies the shutdown priority. The range is 0 - 65,535.

Default

The default value is 2048.

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

To export IPv6 protocols to BGP, you must specify an IPv6 address family.

Note

This command is not currently supported, and is not recommended for use.

Higher priority values lower the chance of an IGP export to be automatically disabled in case BGP or the system goes to a low memory condition.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify *OSPF* and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

Example

The following command configures the shutdown priority of BGP exported OSPF routes to 1000:

```
configure bgp export ospf shutdown-priority 1000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp import-policy

```
configure bgp import-policy [policy-name | none]
```

Description

Configures the import policy for *BGP*.

Syntax Description

policy-name	Specifies the policy.
none	Specifies no policy.

Default

N/A.

Usage Guidelines

Use the none keyword to remove a BGP import policy.

An import policy is used to modify route attributes while adding BGP routes to the IP route table.

Example

The following command configures a policy imprt_plcy for BGP:

```
configure bgp import-policy imprt_plcy
```

The following command unconfigures the import policy for BGP:

```
configure bgp import-policy none
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp local-preference

```
configure bgp local-preference number
```

Description

Changes the default local preference attribute.

Syntax Description

number	Specifies a value used to advertise this router's degree of preference to other routers within the AS. Range is 0 to 2147483647.

Default

100.

Usage Guidelines

BGP must be disabled before the local preference attribute can be changed.

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

Local preference is used to determine a preferred exit point from an AS. Local preferences are exchanged throughout the AS. A change in the local-preference can result in a change in routing and forwarding of traffic leaving the AS.

Example

The following command changes the default local preference attribute to 500:

```
configure bgp local-preference 500
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp maximum-as-path-length

configure bgp **maximum-as-path-length** [*max-as-path* | **none**]

Description

This command adds support for filtering *BGP* updates based on a specified maximum autonomous system path (AS-path) length. This support is on a per BGP instance basis (not per neighbor).

Syntax Description

maximum-as-path-length	Specifies setting the AS path length.
max-as-path	Value specifying the AS path length. Range is 1 to 1,500.
none	Specifies no maximum AS path length.

Default

N/A

Usage Guidelines

It can be desirable to protect the router against BGP updates with excessively long AS-paths to ensure memory is not exhausted. Any BGP updates that exceed this user-defined limit are dropped. This setting does not affect existing routes.

Example

The following example sets the AS-path to 500.

```
configure bgp maximum-as-path-length 500
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bgp maximum-paths

```
configure bgp maximum-paths max-paths
```

Description

Enables or disables the *BGP ECMP (Equal Cost Multi Paths)* feature and specifies the maximum number of paths supported on the current VR.

Syntax Description

max-paths	Specifies the maximum number of paths. The range is 1 to 64. The value 1 disables BGP ECMP. A value greater than 1 enables BGP ECMP and specifies the maximum number of paths.

Default

One. BGP ECMP is disabled.

Usage Guidelines

This command triggers the BGP decision process, causing BGP to re-install the entire BGP routing table into the IP forwarding table. This activity requires a significant amount of switch processor resources, so we recommend that you enable or disable the BGP ECMP feature before enabling the BGP protocol globally on a VR. To ensure that BGP ECMP routes are programmed in the hardware, enter the enable iproute sharing command.

Note

BGP must be disabled before you can change the configuration with this command.

Example

The following command enables BGP ECMP and sets the maximum number of paths to 4 (the maximum number of possible paths is 64):

```
configure bgp maximum-paths 4
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp med

`configure bgp med [`**`none`**` | `*`bgp_med`*`]`

Description

Configures the metric to be included in the Multi-Exit-Discriminator (MED) path attribute.The MED path attribute is included in route updates sent to external peers if a value is configured.

Syntax Description

none	Specifies not to use a multi-exist-discriminator number.
bgp_med	Specifies a multi-exit-discriminator number. The range is 0-2147483647.

Default

N/A.

Usage Guidelines

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer

- lowest cost to Next Hop
- lowest routerID

Note

BGP must be disabled before you can change the configuration with this command.

Example

The following command configures the metric to be included in the MED path attribute:

```
configure bgp med 3
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor allowas-in

```
configure bgp neighbor [all | remoteaddr] {address-family [ipv4-unicast
    | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} allowas-in
    {max-as-occurrence as-count}
```

Description

Configures EBGP to receive and accept a looped EBGP route from the specified neighbor, provided the number of occurrences of local AS number in AS-Path is less than or equal to the value of *as-count*.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.

ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session or for a PE to CE neighbor session.
as-count	The maximum number of occurrences of local AS number in the received route AS-Path. If the number of occurrences of local AS number in AS-Path is more than as-count, the route is not accepted. The valid range is from 1-16.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound EBGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

Note

A looped AS path is always allowed for IBGP, irrespective of the BGP configuration.

All EBGP routes with looped AS-Path are silently discarded by default.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following example enables BGP to accept looped BGP routes that contains a maximum of 6 occurrences of receiver's AS-number in AS-Path attribute:

```
configure bgp neighbor 192.162.17.54 allowas-in max-as-occurrence 6
```

History

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor alternate-local-as

`configure` **`bgp neighbor`** `[`**`all`** | *`remoteaddr`*`]` **`alternate-local-as`** *`asNumber`*

Description

Allows the local router to accept peering sessions intended for the specified alternate local autonomous system (AS).

Syntax Description

`bgp`	Specifies BGP.
`neighbor`	Specifies BGP neighbor.
`all`	Selects configuring all BGP neighbors.
`remoteaddr`	Selects configuring the specified BGP neighbor (IP address).
`alternate-local-as`	Allow alternate local AS number for peering with this neighbor
`asNumber`	AS number (0–4,294,967,295).

Default

N/A.

Usage Guidelines

This command provides configuration flexibility, particularly when peering with third-party devices that may use a different AS number than the ExtremeXOS device uses for auto-peering.

Example

The following example configures the BPG neighbor at 192.168.99.1 to use an alternate local AS "50":

```
# configure bgp neighbor 192.168.99.1 alternate-local-as 50
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor bfd

```
configure bgp {neighbor [all | remoteaddr ]} {bfd [on | off]}
```

Description

Enables or disables Bidirectional Forwarding Detection (BFD) protection of *BGP* peering sessions.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
bfd on | **off**	Configures BFD detection for the specified neighbor(s).

Default

BFD is disabled on neighbor by default.

Usage Guidelines

You must disable a neighbor before configuring BFD.

Example

The following example enables BFD on neighbor 192.168.24.2:

```
# disable bgp neighbor 192.168.24.2
# configure bgp neighbor 192.168.24.2 bfd on
# enable bgp neighbor 192.168.24.2
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bgp neighbor connect-retry

`configure bgp neighbor [`**`all`**` | `*`remoteaddr`*`] `**`connect-retry`**` `*`seconds`*

Description

Configures the *BGP* neighbor retry timer.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
connect-retry	Specifies to configure the time interval between attempts to establish a TCP connection to a configured peer.
seconds	Specifies the retry time in seconds. Default is 30 seconds.

Default

This feature is disabled by default.

Usage Guidelines

Example

The following command configures the BGP neighbor retry timer to 120 seconds:

```
configure bgp neighbor 192.168.1.22 connect-retry 120
```

History

This command was first available in ExtremeXOS 31.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor dampening

```
configure bgp neighbor [all | remoteaddr] {address-family [ipv4-
   unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |
   vpnv4]} dampening {{half-life half-life-minutes {reuse-limit reuse-
   limit-number suppress-limit suppress-limit-number max-suppress max-
   suppress-minutes} | policy-filter [policy-name | none]}
```

Description

Configures the route flap dampening feature for a *BGP* neighbor.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. Using this keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
half-life	Specifies the dampening half life. Range is 1 to 45 minutes.
reuse-limit	Specifies the reuse limit. Range is 1 to 20000.
suppress-limit	Specifies the suppress limit. Range is 1 to 20000.
max-suppress	Specifies the maximum hold down time. Range is 1 to 255 minutes.

policy-filter	Specifies a policy.
none	Removes the configured policy.

Default

This feature is disabled by default.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

The half life is the period of time, in minutes, during which the accumulated penalty of a route is reduced by half. The range is 1 to 45 minutes, and the default is 15 minutes.

The reuse limit is the penalty value below which a route is used again. The range is 1-20,000, and the default is 750.

The suppress limit is the penalty value above which a route is suppressed. The range is 1-20,000, and the default is 2,000.

The maximum hold down time is the maximum time a route can be suppressed, no matter how unstable it has been, as long as it no longer flaps. The range is 1-255 minutes, and the default is 4 * the half life.

If you change dampening parameters when routes are in suppressed or history state, the new dampening parameters apply only to routes in the active state. Routes in the suppressed or history state continue to use the old dampening parameters until they become active, at which time they use the updated dampening parameters.

Instead of explicitly configuring the dampening parameters using the command line, you can associate a policy using the policy-filter option. Multiple sets of parameters can be supplied using a policy.

Use the following command to disable route flap dampening for BGP neighbors:

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
| ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} no-dampening
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures route flap dampening to the BGP neighbor at 192.168.1.22 to the default values:

```
configure bgp neighbor 192.168.1.22 dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor description

```
configure bgp neighbor [all | remoteaddr] description {description}
```

Description

Configures a description for a *BGP* neighbor.

Syntax Description

all	Specifies all IPv4 and IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
description	Specifies a string used to describe the neighbor.

Default

The description is a NULL string by default.

Usage Guidelines

Use this command to attach a description to a BGP neighbor. This description is displayed in the output of the show bgp neighbor command when you specify the detail option, or when you specify a particular neighbor. Enclose the string in double quotes if there are any blank spaces in the string. The maximum length of the string is 56 characters.

If you do not specify the *description* parameter, the description is reset to the default.

This command applies to the current VR or VRF context.

Example

The following command configures the description for the BGP neighbor 192.168.1.22 to Toledo_5:

```
configure bgp neighbor 192.168.1.22 description Toledo_5
```

History

This command was first available in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor dont-allowas-in

```
configure bgp neighbor [all | remoteaddr] {address-family [ipv4-
   unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]}
   dont-allowas-in
```

Description

Disables EBGP from receiving and accepting a looped EBGP route from the specified neighbor, provided the number of occurrences of local AS number in AS-Path is less than or equal to the value of `as-count`.

Syntax Description

all	Specifies that the configuration change applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration change applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration change applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound EBGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

Note

A looped AS path is always allowed for IBGP, irrespective of the BGP configuration.

All EBGP routes with looped AS-Path are silently discarded by default.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor maximum-prefix

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} maximum-
   prefix number {{threshold percent} {teardown {holddown-interval
   seconds}} {send-traps}
```

Description

Configures the maximum number of IP prefixes accepted from a *BGP* neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
number	Specifies the maximum number of prefixes that can be accepted. The range is 0 to 4294967294. A value of 0 disables prefix limit feature.

percent	Specifies the percentage of the maximum prefix (threshold) at which a warning message is printed in the log (and console), and/or a trap is sent to the *SNMP (Simple Network Management Protocol)* manager.
teardown	Specifies that the peer session is torn down when the maximum is exceeded.
seconds	Specifies the length of time before the session is re-established, if the session is torn down due to maximum prefix exceeded. If the hold-down interval is zero or not specified, it is kept down until the peer is enabled. The range is 30 to 86400 seconds.
send-traps	Specifies sending "number of prefix reached threshold" and "number of prefix exceed the max-prefix limit" SNMP traps.

Default

This feature is disabled by default.

The default threshold is 75%.

By default, teardown is not specified.

By default, send-traps is not specified.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Configure the peer group before configuring the neighbors. To configure the peer group, use the following command:

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} maximum-prefix
number {{threshold percent} {teardown {holddown-interval seconds}}
{send-traps}
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the maximum number of IP prefixes accepted from all neighbors to 5000, sets the threshold for warning messages to 60%, and specifies SNMP traps:

```
configure bgp neighbor all maximum-prefix 5000 threshold 60 send-traps
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor next-hop-self

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} [next-hop-
   self | no-next-hop-self]
```

Description

Configures the next hop address used in the outgoing updates to be the address of the *BGP* connection originating the update.

Syntax Description

remoteaddr	Specifies an IP address.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.

next-hop-self	Specifies that the next hop address used in the updates be the address of the BGP connection originating it.
no-next-hop-self	Specifies that the next hop address used in the updates not be the address of the BGP connection originating it (lets BGP decide what would be the next hop).

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context. These settings apply to the peer group and all neighbors of the peer group.

Note

The BGP neighbor must be disabled before you can change the configuration with this command.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the next hop address used in the updates to be the address of the BGP connection originating it:

```
configure bgp neighbor 172.16.5.25 next-hop-self
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor no-dampening

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} no-
   dampening
```

Description

Configures no route flap dampening over *BGP* peer sessions (disables route flap dampening).

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Use the following command to enable route flap dampening for BGP neighbors:

`configure bgp neighbor [`**`all`**` | `*`remoteaddr`*`] {`**`address-family`**` [`**`ipv4-unicast`**` | `**`ipv4-multicast`**` | `**`ipv6-unicast`**` | `**`ipv6-multicast`**` | `**`vpnv4`**`]} dampening {{`**`half-life`**` `*`half-life-minutes`*` {`**`reuse-limit`**` `*`reuse-limit-number`*` `**`suppress-limit`**` `*`suppress-limit-number`*` `**`max-suppress`**` `*`max-suppress-minutes`*`} | `**`policy-filter`**` [`*`policy-name`*` | `**`none`**`]}`

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command disables route flap dampening to the BGP neighbor at 192.168.1.22:

```
configure bgp neighbor 192.168.1.22 no-dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor password

`configure bgp neighbor [`**`all`**` | `*`remoteaddr`*`] `**`password`**` [`**`none`**` | {`**`encrypted`**`} `*`tcpPassword`*`]`

Description

Configures an RSA Data Security, Inc. *MD5 (Message-Digest algorithm 5)* Message-Digest Algorithm secret password for a neighbor.

Syntax Description

all	Specifies all IPv4 and IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
none	Specifies not to use a password
encrypted	Specifies an encrypted string; do not use.
tcpPassword	Specifies a password string.

Default

N/A.

Usage Guidelines

This command applies to the current VR or VRF context.

You must disable the BGP neighbor before changing the password.

When a password is configured, TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication is enabled on the TCP connection that is established with the neighbor.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

To change any one of the following parameters you must disable and re-enable the peer session:

- timer
- source-interface
- soft-in-reset
- password

Changing a route reflector client automatically disables and enables the peer session.

The encrypted option is used by the switch when generating a configuration file, and when parsing a switch-generated configuration file. Do not select the encrypted option in the CLI.

Example

The following command configures the password for a neighbor as Extreme:

```
configure bgp neighbor 192.168.1.5 password extreme
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor peer-group

```
configure bgp neighbor [all | remoteaddr] peer-group [peer-group-name |
   none] {acquire-all}
```

Description

Configures an existing neighbor as the member of a peer group.

Syntax Description

all	Specifies all neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
peer-group-name	Specifies a peer group name.
none	Removes the neighbor from the peer group.
acquire-all	Specifies that all parameters should be inherited by the neighbor from the peer group.

Default

By default, remote AS (if configured for the peer group), source-interface, outbound route policy, send-community and next-hop-self settings are inherited.

Usage Guidelines

This command applies to the current VR or VRF context.

If acquire-all is not specified, only the default parameters are inherited by the neighbor.

When you remove a neighbor from a peer group, it retains the parameter settings of the group. The parameter values are not reset to those the neighbor had before it inherited the peer group values.

To create a new neighbor and add it to a BGP peer group, use the following command:

```
create bgp neighbor remoteaddr peer-group peer-group-name {multi-hop}
```

The new neighbor is created as part of the peer group and inherits all of the existing parameters of the peer group. The peer group must have a remote AS configured.

If you are adding an IPv4 peer to a peer group and no IPv4 address family capabilities are assigned to the specified peer group, the IPv4 unicast and multicast address families are automatically enabled for that peer group. If you adding an IPv6 peer to a peer group and no IPv6 address family capabilities are assigned to the peer group, you must explicitly enable the IPv6 address family capabilities you want to support.

Note

If the peer group or any member of the peer group has been configured with an IPv4 or IPv6 address family, the peer group only accepts peers that are configured to use that family. For example, if a peer group is configured for the IPv4 unicast address family, the switch will not allow you to add an IPv6 peer. LIkewise, an IPv6 peer group cannot accept an IPv4 peer.

Example

The following command configures an existing neighbor as the member of the peer group outer:

```
configure bgp neighbor 192.1.1.22 peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor route-policy

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} route-policy
   [in | out] [none | policy]
```

Description

Configures a route map filter for a neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
in	Specifies to install the filter on the input side.
out	Specifies to install the filter on the output side.
none	Specifies to remove the filter.
policy	Specifies a policy.

Default

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

This command applies to the current VR or VRF context.

The policy can be installed on the input or output side of the router. The policy is used to modify or filter the NLRI information and the path attributes associated with it when exchanging updates with the neighbor.

Note

A policy file applied to BGP neighbors cannot have NLRI for both IPv4 and IPv6 address families defined in the same policy file.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the route-policy filter for a neighbor based on the policy nosales:

```
configure bgp neighbor 192.168.1.22 route-policy in nosales
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor route-reflector-client

```
configure bgp neighbor [remoteaddr | all] [route-reflector-client | no-
   route-reflector-client]
```

Description

Configures a *BGP* neighbor to be a route reflector client.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
route-reflector-client	Specifies for the BGP neighbor to be a route reflector client.
no-route-reflector-client	Specifies for the BGP neighbor not to be a route reflector client.

Default

N/A.

Usage Guidelines

Another way to overcome the difficulties of creating a fully-meshed AS is to use route reflectors. Route reflectors allow a single router to serve as a central routing point for the AS or sub-AS.

Use this command to implicitly define the router to be a route reflector. The neighbor must be in the same AS as the router.

This command applies to the current VR or VRF context.

When changing the route reflector status of a peer, the peer is automatically disabled and re-enabled and a warning message appears on the console and in the log.

A cluster is formed by the route reflector and its client routers. Peer routers that are not part of the cluster must be fully meshed according to the rules of BGP.

Example

The following command configures a BGP neighbor to be a route reflector client:

```
configure bgp neighbor 192.168.1.5 route-reflector-client
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor send-community

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} [send-
   community | dont-send-community] {both | extended | standard}
```

Description

Configures whether the community path attribute associated with a *BGP* NLRI should be included in the route updates sent to the BGP neighbor.

Syntax Description

remoteaddr	Specifies an IP address of a BGP neighbor.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
send-community	Specifies to include the community path attribute.
dont-send-community	Specifies not to include the community path attribute.
both	Send both standard and extended community attributes to this BGP neighbor, or neighbors in peer group
extended	Send only extended communities to this BGP neighbor or neighbors in peer group
standard	Send only standard communities to this BGP neighbor or neighbors in peer group

Default

If no address family is specified, IPv4 unicast is the default. If no optional keyword (both, standard or extended) is specified, standard is assumed.

Usage Guidelines

A BGP community is a group of BGP destinations that require common handling. ExtremeXOS supports the following well-known BGP community attributes:

- no-export
- no-advertise
- no-export-subconfed

The command is additive; that is, if the command is executed twice with the standard or extended option, both the extended and standard communities are sent to the BGP neighbor.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command includes the community path attribute associated with a BGP NLRI in the route updates sent to all BGP neighbors:

```
configure bgp neighbor all send-community
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Options to control the advertisement of extended community attributes were added in ExtremeXOS12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor shutdown-priority

`configure bgp neighbor [`**`all`**` | `*`remoteaddr`*`] `**`shutdown-priority`** *`number`*

Description

Configures the shutdown priority for a *BGP* neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
number	Specifies the shutdown priority. The range is 0 - 65,535.

Default

The default value is 1024.

Usage Guidelines

Note

This command is not currently supported, and is not recommended for use.

Higher priority values lower the chance of a BGP neighbor to be automatically disabled in case BGP or the system goes to a low memory condition.

Example

The following command configures the shutdown priority of the BGP neighbor 10.0.20.1 to 500:

```
configure bgp neighbor 10.0.20.1 shutdown-priority 1000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor soft-reset

```
configure bgp neighbor [remoteaddr | all] {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4 l2vpn-evpn]}
   soft-reset {in | out}
```

Description

Applies the current input or output routing policy to the routing information already exchanged with the neighbor.

Syntax Description

remoteaddr	Specifies an IP address of a *BGP* neighbor.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
l2vpn-evpn	Specifies the Layer 2 VPN-EVPN address family.
soft-reset	Do a soft reconfiguration for the BGP neighbor.
in	Specifies to apply the input routing policy.
out	Specifies to apply the output routing policy.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The input/output policy is determined by the route policy configured for the neighbor on the input and/or output side of the router. This command does not affect the switch configuration.

If both the local BGP neighbor and the neighbor router support the route refresh capability, a dynamic soft input reset can be performed. The configure bgp neighbor soft-reset command triggers the generation of a Route-Refresh message to the neighbor. As a response to the Route-Refresh message, the neighbor sends the entire BGP routing table in updates and the switch applies the appropriate routing policy to the updates.

This command applies to the current VR or VRF context.

If the route-refresh capability is not supported by the neighbor, the `configure bgp neighbor soft-reset` command reprocesses the BGP route database using the policy configured for that neighbor.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command applies the current input routing policy to the routing information already exchanged with the neighbor:

```
# configure bgp neighbor 192.168.1.5 soft-reset in
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Support for Layer 2 VPN-EVPN was added in ExtremeXOS 30.5.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor source-interface

```
configure bgp neighbor [remoteaddr | all] source-interface [any |
   ipaddress ipAddr]
```

Description

Changes the *BGP* source interface for TCP connections.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
any	Specifies any source interface.
ipAddr	Specifies the IP address of a source interface.

Default

Any.

Usage Guidelines

The source interface IP address must be a valid IP address of any *VLAN* configured on the switch.

This command applies to the current VR or VRF context.

Example

The following command changes the BGP source interface to 10.43.55.10:

```
configure bgp neighbor 192.168.1.5 source-interface ipaddress 10.43.55.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor timer

```
configure bgp neighbor [remoteaddr | all] timer keep-alive keepalive
   hold-time holdtime
```

Description

Configures the *BGP* neighbor timers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
keepalive	Specifies a BGP neighbor timer keepalive time in seconds. The range is 0 to 21,845 seconds.
holdtime	Specifies a BGP neighbor timer hold time in seconds. The range is 0 and 3to65,535 seconds.

Default

The default keepalive setting is 60 seconds. The default hold time is 180 seconds.

Usage Guidelines

You must disable the BGP neighbor before changing the timer values.

This command applies to the current VR or VRF context.

Example

The following command configures the BGP neighbor timers:

```
configure bgp neighbor 192.168.1.5 timer keep-alive 120 hold-time 360
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp neighbor weight

```
configure bgp neighbor [remoteaddr | all] weight weight
```

Description

Assigns a locally-used weight to a neighbor connection for the route selection algorithm.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a *BGP* neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
weight	Specifies a BGP neighbor weight.

Default

By default, the weight is 1.

Usage Guidelines

All routes learned from this peer are assigned the same weight. The route with the highest weight is more preferable when multiple routes are available to the same network. The range is 0 to 65,535.

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

This command applies to the current VR or VRF context.

Example

The following command assigns a locally used weight of 10 to a neighbor connection:

```
configure bgp neighbor 192.168.1.5 weight 10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group allowas-in

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} allowas-in
   {max-as-occurrence as-count}
```

Description

Configures *BGP* to receive and accept a looped BGP route from the neighbors of the specified peer group, provided the number of occurrences of local AS number in AS-Path is less than or equal to that specified in `as-count`.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
as-count	The maximum number of occurrences of local AS number in the received route AS-Path. If the number of occurrences of local AS number in AS-Path is more than as-count, the route is not accepted. The valid range is from 1-16.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound BGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

This feature can also be enabled for both IBGP and EBGP neighbors, wherever necessary.

This command applies to the current VR or VRF context.

Note

BGP neighbors do not inherit the allowas-in configuration from their peer group unless you explicitly specify the acquire-all option when adding a neighbor to a peer-group.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following example enables BGP to accept looped BGP routes that contains a maximum of 8 occurrences of receiver's AS-number in AS-Path attribute:

```
configure bgp peer-group internal allowas-in max-as-occurrence 8
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group connect-retry

configure bgp peer-group *peer-group-name* **connect-retry** *seconds*

Description

Configures the *BGP* retry timer of the specified peer group.

Syntax Description

peer-group-name	Specifies a peer group.
connect-retry	Specifies to configure the time interval between attempts to establish a TCP connection to a configured peer.
seconds	Specifies the retry time in seconds. Default is 30 seconds.

Default

This feature is disabled by default.

Usage Guidelines

Example

The following command configures the BGP peer group "internal" retry timer to 120 seconds:

```
configure bgp peer-group internal connect-retry 120
```

History

This command was first available in ExtremeXOS 31.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group dampening

```
configure bgp peer-group peer-group-name {address-family [ipv4-
   unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]}
   dampening {{half-life half-life-minutes {reuse-limit reuse-limit-
   number supress-limit suppress-limit-number max-suppress max-suppress-
   minutes}} | policy-filter [policy-name | none]}
```

Description

Configures route flap dampening for a *BGP* peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.

ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
half-life-minutes	Specifies the dampening half life.
reuse-limit-number	Specifies the reuse limit.
suppress-limit-number	Specifies the suppress limit.
max-suppress-minutes	Specifies the maximum hold down time.
policy-name	Specifies a policy.
none	Removes any policy association.

Default

This feature is disabled by default.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

The half life is the period of time, in minutes, during which the accumulated penalty of a route is reduced by half. The range is 1 to 45 minutes, and the default is 15 minutes.

The reuse limit is the penalty value below which a route is used again. The range is 1-20,000, and the default is 750.

The suppress limit is the penalty value above which a route is suppressed. The range is 1-20,000, and the default is 2,000.

The maximum hold down time is the maximum time a route can be suppressed, no matter how unstable it has been, as long as it no longer flaps. The range is 1-255 minutes, and the default is 4 * the half life.

If you change dampening parameters when routes are in suppressed or history state, the new dampening parameters apply only to routes in the active state. Routes in the suppressed or history state continue to use the old dampening parameters until they become active, at which time they use the updated dampening parameters.

Instead of explicitly configuring the dampening parameters using the command line, you can associate a policy using the policy-filter option. Multiple sets of parameters can be supplied using a policy.

Use the following command to disable route flap dampening for a BGP peer-group:

`configure bgp peer-group` *`peer-group-name`* {**`address-family`** [**`ipv4-unicast`** | **`ipv4-multicast`** | **`ipv6-unicast`** | **`ipv6-multicast`** | **`vpnv4`**]} `no-dampening`

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures route flap dampening for the BGP peer group outer:

```
configure bgp peer-group outer dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group dont-allowas-in

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} dont-allowas-
   in
```

Description

Disables *BGP* from receiving and accepting a looped BGP route from the neighbors of the specified peer group, provided the number of occurrences of local AS number in AS-Path is less than or equal to that specified in `as-count`.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Note

BGP neighbors do not inherit the allowas-in configuration from their peer group unless you explicitly specify the acquire-all option when adding a neighbor to a peer-group.

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group maximum-prefix

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} maximum-prefix
   number {{threshold percent} {teardown {holddown-interval seconds}}
   {send-traps}
```

Description

Configures the maximum number of IP prefixes accepted for all neighbors in the peer group.

Syntax Description

name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
number	Specifies the maximum number of prefixes that can be accepted. The range is 0 to 4294967294. A value of 0 disables prefix limit feature.
percent	Specifies the percentage of the maximum prefix (threshold) at which a warning message is printed in the log (and on the console). An *SNMP* trap can also be sent.
teardown	Specifies that the peer session is torn down when the maximum is exceeded.
seconds	Specifies the length of time before the session is re-established, if the session has been torn down due to exceeding the max limit. If the hold down interval is 0 or not specified, it is kept down until the peer is enabled. The range is 30 to 86400 seconds.
send-traps	Specifies sending “number of prefix reached threshold” and “number of prefix exceed the max-prefix limit” SNMP traps.

Default

This feature is disabled by default.

The default threshold is 75%.

By default, teardown is not specified.

By default, send-traps is not specified.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Configure the peer group before configuring the neighbors. To configure the neighbors, use the following command:

```
configure bgp neighbor 192.168.1.1 maximum-prefix
```

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for *BGP* neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the maximum number of IP prefixes accepted from the peer group outer to 5000, sets the threshold for warning messages to 60%, and specifies SNMP traps:

```
configure bgp peer-group outer maximum-prefix 5000 threshold 60 send-traps
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group next-hop-self

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} [next-hop-self
   | no-next-hop-self]
```

Description

Configures the next hop address used in the updates to be the address of the *BGP* connection originating the update.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
next-hop-self	Specifies that the next hop address used in the updates be the address of the BGP connection originating it.
no-next-hop-self	Specifies that the next hop address used in the updates not be the address of the BGP connection originating it (Let the BGP protocol decide the next hop).

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

These settings apply to the peer group and all neighbors of the peer group.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the next hop address used in the updates to be the address of the BGP connection originating it:

```
configure bgp peer-group outer next-hop-self
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group no-dampening

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} no-dampening
```

Description

Configures no route flap dampening for a *BGP* peer group (disables route flap dampening).

Syntax Description

peer-group-name	Specifies a BGP peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Use the following command to enable route flap dampening for a BGP peer-group:

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast
| ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} dampening
{{half-life half-life-minutes {reuse-limit reuse-limit-number suppress-
limit suppress-limit-number max-suppress max-suppress-minutes}} |
policy-filter [policy-name | none]}
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command disables route flap dampening to the BGP peer group outer:

```
configure bgp peer-group outer no-dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group password

```
configure bgp peer-group peer-group-name password [none | {encrypted}
   tcpPassword]
```

Desccription

Configures the TCP RSA Data Security, Inc. *MD5* Message-Digest Algorithm secret password for a peer group and all neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
none	Specifies no password.
tcpPassword	Specifies a password.
encrypted	Specifies an encrypted string.

Default

N/A.

Usage Guidelines

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

This command applies to the current VR or VRF context.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following command configures the password as Extreme for the peer group outer and its neighbors:

```
configure bgp peer-group outer password extreme
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group remote-AS-number

```
configure bgp peer-group peer-group-name remote-AS-number number
```

Description

Configures the remote AS number for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
number	Specifies a remote AS number. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following example configures the remote AS number for the peer group outer and its neighbors using the ASPLAIN 4-byte AS number format:

```
configure bgp peer-group outer remote-AS-number 65536
```

The following example configures the remote AS number for the peer group abc and its neighbors using the ASDOT 4-byte AS number format:

```
configure bgp peer-group abc remote-AS-number 1.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group route-policy

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} route-policy
   [in |out] [none | policy]
```

Description

Configures the policy for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
in	Specifies to install the policy on the input side.
out	Specifies to install the policy on the output side.
none	Specifies to remove the filter.
policy	Specifies a policy.

Default

There is no default policy configuration.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for *BGP* neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the route policy for the peer group outer and its neighbors using the policy nosales:

```
configure bgp peer-group outer route-policy in nosales
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group route-reflector-client

```
configure bgp peer-group peer-group-name [route-reflector-client | no-
   route-reflector-client]
```

Description

Configures all the peers in a peer group to be a route reflector client.

Syntax Description

peer-group-name	Specifies a peer group.
route-reflector-client	Specifies that all the neighbors in the peer group be a route reflector client.
no-route-reflector-client	Specifies that all the neighbors in the peer group not be a route reflector client.

Default

N/A.

Usage Guidelines

This command implicitly defines this router to be a route reflector.

This command applies to the current VR or VRF context.

The peer group must be in the same AS of this router.

Example

The following command configures the peer group outer as a route reflector client:

```
configure bgp peer-group outer route-reflector-client
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group send-community

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast
   | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} [send-
   community | dont-send-community] {both | extended | standard}
```

Description

Configures whether communities should be sent to neighbors as part of route updates.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
send-community	Specifies that communities are sent to neighbors as part of route updates.
dont-send-community	Specifies that communities are not sent to neighbors as part of route updates.
both	Send both standard and extended community attributes to this *BGP* neighbor, or neighbors in peer group.
extended	Send only extended communities to this BGP neighbor or neighbors in peer group.
standard	Send only standard communities to this BGP neighbor or neighbors in peer group.

Default

If no address family is specified, IPv4 unicast is the default. If no optional keyword (both, standard or extended) is specified, standard is assumed.

Usage Guidelines

These settings apply to the peer group and all neighbors of the peer group.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

The command is additive; that is, if the command is executed twice with the standard or extended option, both the extended and standard communities are sent to the BGP neighbor.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures communities to be sent to neighbors as part of route updates:

```
configure bgp peer-group outer send-community
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Options to control the advertisement of extended community attributes were added in ExtremeXOS12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group soft-reset

```
configure bgp peer-group peer-group-name {address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} soft-reset {in
   | out}
```

Description

Applies the current input/output routing policy to the neighbors in the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
in	Specifies to apply the input routing policy.
out	Specifies to apply the output routing policy.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The input/output routing policy is determined by the route policy configured for the neighbors in the peer group on the input/output side of the router. This command does not affect configuration of the switch.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

Any configuration change with this command automatically disables and enables the neighbors before the changes.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the *MPLS*-enabled VR; this feature is not supported for *BGP* neighbors on the CE (VRF) side of the PE router.

Example

The following command applies the current input routing policy to the neighbors in the peer group outer:

```
configure bgp peer-group outer soft-reset in
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group source-interface

```
configure bgp peer-group peer-group-name source-interface [any |
   ipaddress ipAddr]
```

Description

Configures the source interface for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
any	Specifies any source interface.
ipAddr	Specifies an interface.

Default

N/A.

Usage Guidelines

The source interface IP address must be a valid IP address of a *VLAN* configured on the switch.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

This command applies to the current VR or VRF context.

After you enter this command, the switch automatically disables and enables the neighbors so that the changes can take effect.

Example

The following command configures the source interface for the peer group outer and its neighbors on 10.34.25.10:

```
configure bgp peer-group outer source-interface ipaddress 10.34.25.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group timer

```
configure bgp peer-group peer-group-name timer keep-alive seconds hold-
   time seconds
```

Description

Configures the keepalive timer and hold timer values for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
keep-alive *seconds*	Specifies a keepalive time in seconds. Range is 0 to 21845.
hold-time *seconds*	Specifies a hold-time in seconds. Range is 0 and 3 to 65535.

Default

N/A.

Usage Guidelines

This command applies to the current VR or VRF context.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following command configures the keepalive timer and hold timer values for the peer group outer and its neighbors:

```
configure bgp peer-group outer timer keep-alive 30 hold-time 90
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp peer-group weight

```
configure bgp peer-group peer-group-name weight weight
```

Description

Configures the weight for the peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
weight	Specifies a *BGP* peer group weight. Range is 0 to 65,535.

Default

N/A.

Usage Guidelines

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

This command applies to the current VR or VRF context.

Example

The following command configures the weight for the peer group outer and its neighbors:

```
configure bgp peer-group outer weight 5
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp restart address-family

```
configure bgp restart [add | delete] address-family [ipv4-unicast |
   ipv4-multicast |ipv6-unicast | ipv6-multicast]
```

Description

Configures the address family used with graceful *BGP* restart.

Syntax Description

add	Add the address family.
delete	Remove the address family.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

The default is IPv4 unicast.

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the `disable bgp` command.

This command configures the address family participating in graceful BGP restart. An address family can be added or deleted. By adding an address family, BGP instructs the switch to preserve BGP routes of that address family during a graceful restart. The local OPEN message contains all the added address families.

Note

When graceful restart is enabled on the switch, the IPv4 unicast address family support is added by default. Graceful restart for other address families must be explicitly added using this command.

For BGP graceful restart to inter-operate with Cisco routers, any restarting routers connected to Cisco routers must be configured with the command, `enable bgp neighbor capability`, in the following form: `enable bgp neighbor` *`remoteaddr`* `capability ipv4-unicast`. The command must be executed before BGP is enabled globally on the switch.

Example

The following command configures a router to add IPv4 unicast addresses to graceful BGP restarts:

```
configure bgp restart add address-family ipv4-unicast
```

History

This command was first available in ExtremeXOS 11.4.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp restart restart-time

`configure bgp restart restart-time` *`seconds`*

Description

Configures the restart time used with graceful *BGP* restart. This is the maximum time a receiver router waits for a restarting router to come back up.

Syntax Description

`seconds`	Specifies the restart time. The range is 1 to 3600 seconds.

Default

The default is 120 seconds.

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the `disable bgp` command.

This command configures the restart timer. This timer is started on the receiver router when it detects the neighbor router is restarting (usually when the peer TCP session is reset). At that time, routes from the restarting router are marked as stale, but are preserved in the routing table. The timer is stopped when the restarting BGP neighbor goes to the ESTABLISHED state (it has finished restarting). If the timer expires, the stale routes are deleted.

Example

The following command configures the graceful BGP restart timer:

```
configure bgp restart restart-time 200
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp restart stale-route-time

```
configure bgp restart stale-route-time seconds
```

Description

Configures the stale route timer used with graceful *BGP* restart. This is the maximum time to hold stale paths on receiver routers while its neighbor gracefully restarts.

Syntax Description

seconds	Specifies the stale route time. The range is 1 to 3600 seconds.

Default

The default is 360 seconds.

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the `disable bgp` command.

This command configures the stale route timer. This timer is started when the restarting BGP peer goes to the ESTABLISHED state after it restarts. The timer is stopped when the restarting BGP peer sends EOR messages for all address families. When the timer is stopped, or it expires, the stale routes are deleted.

Example

The following command configures the graceful BGP stale route timer:

```
configure bgp restart stale-route-time 400
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp restart update-delay

```
configure bgp restart update-delay seconds
```

Description

Configures the update delay timer used with graceful *BGP* restart. This is the maximum time to delay updating BGP routes to the local IP route table.

Syntax Description

seconds	Specifies the stale route time. The range is 1 to 3600 seconds.

Default

The default is 600 seconds.

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the `disable bgp` command.

This command configures the update delay timer. Usually, a restarting router waits to receive EOR messages from all the receiving BGP neighbors before it starts the route update. Otherwise, it does the route selection when the timer expires.

Example

The following command configures the graceful BGP update delay timer:

```
configure bgp restart update-delay 800
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp restart

```
configure bgp restart [none | planned | unplanned | both | aware-only]
```

Description

Configures the router as a graceful *BGP* restart router.

Syntax Description

none	Do not act as a graceful BGP restart router.
planned	Only act as a graceful BGP restart router for planned restarts.
unplanned	Only act as a graceful BGP restart router for unplanned restarts.
both	Act as a graceful BGP restart router for both planned and unplanned restarts.
aware-only	Only act as a graceful BGP receiver (helper) router.

Default

The default is none; graceful restart is disabled.

Usage Guidelines

This command configures the router as a graceful BGP router. You can decide to configure a router to enter graceful restart for only planned restarts, for only unplanned restarts, or for both. Also, you can decide to configure a router to be a receiver only (which helps a restarting BGP router to perform the graceful restart process), and not to do graceful restarts itself.

After a graceful restart, the switch preserves the time stamps for all BGP routes in the RIB that were received before the stale timer expired. After restart, the capabilities for all BGP peers are renegotiated.

Note

End of Restart (EOR) messages are not sent to BGP peers if the graceful restart feature is disabled.

This command cannot be used while BGP is enabled globally on the switch.

Example

The following command configures a router to perform graceful BGP restarts only for planned restarts:

```
configure bgp restart planned
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp routerid

`configure bgp routerid` *`router-identifier`*

Description

Changes the router identifier.

Syntax Description

`router identifier`	Specifies a router identifier in the IPv4 address format.

Default

N/A.

Usage Guidelines

BGP must be disabled before changing the router ID.

BGP selects routes based on the following precedence (from highest to lowest):

- Higher weight
- Higher local preference
- Shortest length (shortest AS path)
- Lowest origin code
- Lowest MED
- Route from external peer
- Lowest cost to Next Hop
- Lowest router ID

This command applies to the current VR or VRF context.

Example

The following command changes the router ID:

```
configure bgp routerid 192.1.1.13
```

Note
To remove the configured bgp routerid, give routerid value as 0.0.0.0 i.e. configure bgp routerid 0.0.0.0.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure bgp soft-reconfiguration

```
configure bgp soft-reconfiguration
```

Description

Immediately applies the route policy associated with the network command, aggregation, import, and redistribution.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command does not affect the switch configuration.

This command applies to the current VR or VRF context.

Example

The following command applies the route policy associated with the network command, aggregation, import, and redistribution:

```
configure bgp soft-reconfiguration
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *BGP* feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure bootprelay

```
configure bootprelay [ {vlan [vlan_name]} [add ip_address | delete
   [ip_address] | all ]]
```

Description

This command configures DHCPv4 server/next hop relay for each *VLAN* IPv4 interfaces. This command is not applicable to IPv6 interfaces. Configuring bootprelay per VLAN v4 level is supported only on IPv4, and not on IPv6.

Syntax Description

bootprelay	BOOTP Relay service.
add	Adds *DHCP* BOOTP Relay server.
delete	Deletes DHCP BOOTP Relay server.
ip_address	IP address of bootp relay server.

Default

N/A.

Usage Guidelines

Use this command to configure the DHCPv4 server/next hop for each VLAN interface. The configuration applied to the VR level is populated to all VLAN v4 IPv4/v6 interfaces.

Example

The following example displays IPv6 bootprelay information:

```
# sh bootprelay configuration ipv4
DHCPv4 BOOTP Relay : Enabled on virtual router "VR-Default"
    Include Secondary    : Disabled
    BOOTP Relay Servers  : 10.127.6.243
    DHCP Relay Agent Information Option: Disabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace

VLAN                                  DHCPv4 BOOTP Relay
------------------------              ------------------
VLAN "Default":
    BOOTP Relay                      : Enabled
VLAN "client":
    BOOTP Relay                      : Enabled
    BOOTP Relay Servers              : 10.1.1.1   10.127.6.101   10.127.6.243
    DHCP Relay Agent Information Option: Disabled
    DHCP Relay Agent Information Check : Disabled
    DHCP Relay Agent Information Policy: Replace
VLAN "client1":
    BOOTP Relay                      : Enabled
VLAN "dhcpv4server":
    BOOTP Relay                      : Enabled
VLAN "server":
    BOOTP Relay                      : Enabled
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay add

`configure bootprelay {`**`ipv4`** `|` **`ipv6`**`} add` *`ip_address`* `{`**`vr`** *`vrid`*`}`

Description

Configures the addresses to which BOOTP requests should be directed.

Syntax Description

ipv4	DHCPv4 BOOTP Relay service (default).
ipv6	DHCPv6 BOOTP relay service.
ip_address	Specifies an IP address.
vrid	Specifies a VR or VRF name.

Default

If you do not specify a VR or VRF, the current VR context is used.

If you do not specify DHCPv4 or v6 BOOTP Relay service, DHCPv4 is used.

Usage Guidelines

After IP unicast routing has been configured, you can configure the switch to forward *DHCP* or BOOTP requests coming from clients on subnets being serviced by the switch and going to hosts on different subnets.

To configure the relay function, follow these steps:

1. Configure VLANs and IP unicast routing.
2. Configure the addresses to which DHCP or BOOTP requests should be directed, using the following command: `configure bootprelay add ip_address`
3. Enable the DHCP or BOOTP relay function using the following command: `enable bootprelay`

Example

The following example configures BOOTP requests to be directed to 123.45.67.8:

```
configure bootprelay add 123.45.67.8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay delete

`configure bootprelay {`**`ipv4`** `|` **`ipv6`**`} delete [`*`ip_address`* `|` **`all`**`] {`**`vr`** *`vrid`*`}`

Description

Removes one or all IP destination addresses for forwarding BOOTP packets.

Syntax Description

ipv4	DHCPv4 BOOTP Relay service (default).
ipv6	DHCPv6 BOOTP relay service.
ip_address	Specifies an IP address.
all	Specifies all IP address entries.
vrid	Specifies a VR or VRF name.

Default

If you do not specify a VR, the current VR context is used.

If you do not specify DHCPv4 or v6 BOOTP Relay service, DHCPv4 is used.

Usage Guidelines

None.

Example

The following command removes the destination address:

```
configure bootprelay delete 123.45.67.8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information check

```
configure bootprelay dhcp-agent information check
```

Description

Enables the *DHCP* relay agent option (option 82) checking.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to prevent DHCP reply packets with invalid or missing relay agent options from being forwarded to the client.

To disable this check, use the following command:

```
unconfigure bootprelay dhcp-agent information check
```

Example

The following command configures the DHCP relay agent option check:

```
configure bootprelay dhcp-agent information check
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information circuit-id port-information

```
configure bootprelay dhcp-agent information circuit-id port-information
   port_info port port
```

Description

Configures the circuit ID sub-option that identifies the port for an incoming *DHCP* request.

Syntax Description

port_info	Specifies a text string that becomes the circuit ID sub-option for the specified port. Specify a text string composed of 1 to 32 characters.
port	Specifies the port to which the circuit ID sub-option is assigned.

Default

The default port_info is encoded as ((slot_number * 1000) + port_number/portIfindex). For example, if the DHCP request is received on port 3:12, the default circuit ID port_info value is 3012. On standalone switches, the slot number is one, so the default circuit ID port_info value is (1000 + port_number/portIfindex). For example, the default port_info for port 3 on a standalone switch is 1003.

Usage Guidelines

The full circuit ID string uses the format *vlan_info-port_info* . To configure the *vlan_info* portion of the circuit ID string, use the following command:

```
configure bootprelay dhcp-agent information circuit-id vlan-information
vlan_info {vlan} [vlan_name|all]
```

To display the port_info information, use the following command:

```
show bootprelay dhcp-agent information circuit-id port-information ports
all
```

Example

The following command configures the circuit ID port_info value slot1port3 for port 1:3:

```
configure bootprelay dhcp-agent information circuit-id port-information slot1port3 port
1:3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information circuit-id vlan-information

```
configure bootprelay dhcp-agent information circuit-id vlan-information
   vlan_info {vlan} [vlan_name|all]
```

Description

Configures the circuit ID sub-option that identifies the *VLAN* for an incoming *DHCP* request.

Syntax Description

vlan_info	Specifies a text string that becomes the circuit ID sub-option for the specified VLAN. Specify a text string composed of 1 to 32 characters.
vlan_name	Specifies the VLAN to which the circuit ID sub-option is assigned.
all	Specifies that the vlan_info entered is to be used in the circuit ID sub-option for all VLANs.

Default

The default vlan_info for each VLAN is the VLAN ID or tag.

Usage Guidelines

The full circuit ID string uses the format *vlan_info-port_info* . To configure the port_info portion of the circuit ID string, use the following command:

```
configure bootprelay dhcp-agent information circuit-id port-information
port_info port port
```

To display the vlan_info information, use the following command:

```
show bootprelay dhcp-agent information circuit-id vlan-information
```

Example

The following command configures the circuit ID vlan_info value VLANblue for VLAN blue:

```
configure bootprelay dhcp-agent information circuit-id vlan-information VLANblue blue
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information option

```
configure bootprelay dhcp-agent information option
```

Description

Enables the *DHCP* relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

After IP unicast routing has been configured, you can configure the switch to forward DHCP or BOOTP requests coming from clients on subnets being serviced by the switch and going to hosts on different subnets.

To configure the relay function, follow these steps:

- Configure VLANs and IP unicast routing.
- Enable the DHCP or BOOTP relay function, using the following command: `enable bootprelay {{vlan} [vlan_name] | {vr} vr_name} | all [{vr} vr_name]}`
- Configure the addresses to which DHCP or BOOTP requests should be directed, using the following command: `configure bootprelay add ip_address {vr vrid}`

Configure the DHCP relay agent option (option 82), using the following command:

```
configure bootprelay dhcp-agent information option
```

To disable the DHCP relay agent option (option 82), use the following command: `unconfigure bootprelay dhcp-agent information option`

Example

The following example configures the DHCP relay agent option:

```
configure bootprelay dhcp-agent information option
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information policy

```
configure bootprelay dhcp-agent information policy [drop | keep |
   replace]
```

Description

Configures the *DHCP* relay agent option (option 82) policy.

Syntax Description

drop	Specifies to drop the packet.
keep	Specifies to keep the existing option 82 information in place.
replace	Specifies to replace the existing data with the switch's own data.

Default

Replace.

Usage Guidelines

Use this command to set a policy for the relay agent. Packets can be dropped, the option 82 information can be replaced (the default), or the packet can be forwarded with the information unchanged.

Example

The following command configures the DHCP relay agent option 82 policy to keep:

```
configure bootprelay dhcp-agent information policy keep
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent information remote-id

```
configure bootprelay dhcp-agent information remote-id [remote_id |
   system-name] {vr vrid}
```

Description

Configures the remote ID sub-option that identifies the relaying switch for *DHCP* requests and replies.

Syntax Description

remote_id	Specifies a text string that becomes the remote ID sub-option for the switch. Specify a text string composed of 1 to 32 characters.
system-name	Specifies that the switch name is used as the remote ID sub-option for the switch.
vrid	Specifies the VR on which to configure the remote ID sub-option.

Default

The switch MAC address.

Usage Guidelines

To display the remote-ID, use the following command: `show bootprelay`

Example

The following example configures the remote ID sub-option to specify the switch name in DHCP requests and replies:

```
configure bootprelay dhcp-agent information remote-id system-name
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay dhcp-agent source-vlan

```
configure bootprelay dhcp-agent source-vlan {vlan_name} {vr vrid}
```

Description

Configures a source VLAN to use as the source IP address in the BOOTPrelay packet.

Syntax Description

bootprelay	Specifies BOOTPrelay agent information option.
dhcp-agent	Specifies DHCP agent.
source-vlan	Specifies using the IP address of the configured loopback VLAN as the gateway IP (giaddr) field when BOOTPrelay is used for the anycast VLAN.
vlan_name	Specifies the loopback VLAN name.
vr	Specifies using a specific virtual router ID.
vrid	Specifies the virtual router ID.

Default

N/A.

Usage Guidelines

When a VLAN is configured with an anycast MAC address and has an anycast IP address, the source address must be a unique reachable IP address. Without a unique IP address, the DHCP reply from the server might not reach the DHCP relay ExtremeXOS device. The source VLAN must be a loopback VLAN that is configured on the specified VRF. If a source VLAN is not configured, then a loopback VLAN is automatically picked for anycast VLANs receiving a DHCP request.

To view the selected source VLAN, use the command `show bootprelay configuration {ipv4 | ipv6} {{vlan vlan_name } | {vr vr_name}}` .

Example

The following example configures the VLAN "vlan1" to use as the source IP address in the BOOTPrelay packet:

```
# configure bootprelay dhcp-agent source-vlan vlan1
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay include-secondary

```
configure bootprelay {ipv4 | ipv6} include-secondary {sequential |
   parallel | off} {vr vr_name}
```

Description

Configures *DHCP* smart relay mode, and includes a secondary IP address as the giaddr at the VR level.

Syntax Description

ipv4	Specifies DHCPv4 BOOTP Relay service (default).
ipv6	Specifies DHCPv6 BOOTP Relay service.
include-secondary	(Optional) Uses both primary and secondary address(es) of the client *VLAN* as gateway address.
sequential	Uses primary and secondary address(es) of client VLAN in sequence after 3 retries (default if include-secondary is on).
parallel	Uses primary and secondary address(es) of client VLAN in parallel.
off	Disables use of both primary and secondary address(es) of client VLAN as gateway address (default).
vr	Specifies a virtual router ID.
vr_name	Specifies the virtual router.

Default

IPv4 is the default relay service.

The default value is **off**, but **sequential** is the default if **include-secondary** is on.

Usage Guidelines

Use this command to configure DHCP smart relay mode, and to include a secondary IP address as giaddr at the VR level.

Example

The following example configures DHCPv4 BOOTP Relay service to use both primary and secondary addresses of the client VLAN as the gateway address. By default, the command specifies that you use the primary and secondary addresses of the client VLAN in sequence after three retries.

```
configure bootprelay ipv4 include-secondary sequential
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay ipv6 option interface-id

```
configure bootprelay ipv6 option [ interface-id ] [identifier_string |
   system_name | none] [vlan vlan_name | all]
```

Description

This command configures the option **interface-id** as described in RFC-4649 to an IPv6 bootp relay/*DHCP* relay agent.

Syntax Description

bootprelay	BOOTP Relay Service
ipv6	DHCPv6 BOOTP Relay Service
option	DHCPv6 BOOTP Relay options
interface-id	Interface identifier option.
interface_id_string	Interface identifier string.
none	Identifier defaults to 802.1Q *VLAN* ID.
all	All VLANs.

Default

802.1Q VLAN ID if not configured.

Usage Guidelines

Use this command to configure the option **interface-id** as described in RFC-4649 to an IPv6 BOOTP relay/DHCP relay agent. After receiving an IPv6 BOOTP/DHCP request packet on the specified VLAN, the agent adds the configured identifier to the packet and passes it to the server. If this option is configured to be as **system-name**, the switch name is used as the remote-id. The same can be unconfigured using the **none** option. After unconfiguring this option, the switch MAC address (the default value) is used as remote-id. This option can be configured or unconfigured to a specified VLAN or to all VLANs.

Example

```
* Switch # show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
    BOOTP Relay Servers : 2001:0db8:85a3:0000:0000:8a2e:0370:7334
                          2001:0db8:85a3:0000:0000:8a2e:0370:7335
                          2001:0db8:85a3:0000:0000:8a2e:0370:7336
                          2001:0db8:85a3:0000:0000:8a2e:0370:7337
VLAN "Default":
    BOOTP Relay         : Disabled
```

```
VLAN "v1":
    BOOTP Relay         : Enabled
    Interface ID        : v1-12
    Remote ID           : v1_remId
VLAN "v2":
    BOOTP Relay         : Enabled
    Interface ID        : 100 (Default)
    Remote ID           : 00:04:96:52:A7:1B (Default)
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay ipv6 option remote-id

```
configure bootprelay ipv6 option [remote-id] [identifier_string] |
   system-name | none] [vlan vlan_name | vlan all]
```

Description

This command configures the **remote-id** option as described in RFC-4649 to an IPv6 BOOTP relay/ *DHCP* relay agent.

Syntax Description

bootprelay	BOOTP Relay Service
ipv6	DHCPv6 BOOTP Relay Service
option	DHCPv6 BOOTP Relay options
remote-id	Remote-ID sub-option to identify remote host
remote_id_string	Remote ID String
system-name	System Name string
none	Identifier defaults System MAC address
all	All *VLAN*s

Default

System MAC address if not configured.

Usage Guidelines

Use this command to configure the **remote-id** option as described in RFC-4649 to an IPv6 BOOTP relay/DHCP relay agent. After receiving an IPv6 BOOTP/DHCP request packet on the specified VLAN, the agent adds the configured identifier to the packet and passes it to the server. If this option is

configured to be as **system-name**, the switch name is used as the remote-id. The same can be unconfigured using the **none** option. After unconfiguring this option, the switch MAC address (the default value), is used as remote-id. This option can be configured orunconfigured to a specified VLAN or to all VLANs.

Example

```
* Switch # show bootprelay ipv6
BOOTP Relay: DHCPv6 BOOTP Relay enabled on virtual router "VR-Default"
    BOOTP Relay Servers : 2001:0db8:85a3:0000:0000:8a2e:0370:7334
                          2001:0db8:85a3:0000:0000:8a2e:0370:7335
                          2001:0db8:85a3:0000:0000:8a2e:0370:7336
                          2001:0db8:85a3:0000:0000:8a2e:0370:7337
VLAN "Default":
    BOOTP Relay         : Disabled
VLAN "v1":
    BOOTP Relay         : Enabled
    Interface ID        : v1-12
    Remote ID           : v1_remId
VLAN "v2":
    BOOTP Relay         : Enabled
    Interface ID        : 100 (Default)
    Remote ID           : 00:04:96:52:A7:1B (Default)
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay ipv6 prefix-delegation snooping add

```
configure bootprelay ipv6 prefix-delegation snooping add ipv6_prefix
   ipv6Gateway {vlan} vlan_name valid-time valid_time
```

Description

Adds information about a snooped IPv6 delegated prefix on a *VLAN*.

Syntax Description

ipv6_prefix	Specifies the IPv6 prefix (/prefix length) to be added.
ipv6Gateway	Specifies the IPv6 gateway address.
vlan_name	Specifies the VLAN.
valid_time	Time, in seconds, that the delegated IPv6 prefix is valid.

Default

N/A

Usage Guidelines

Allows you to add a particular IPv6 delegated prefix to snoop if the prefix was issued or renewed during reboot. If the prefix has been snooped earlier, this command renews the valid time for the prefix.

To set the specified prefix to always be valid, set the **valid-time** parameter to 0.

Before adding an IPv6 delegated prefix to snoop, you must enable IPv6 BOOTP relay and prefix snooping using `enable bootprelay` **ipv6** and `configure bootprelay ipv6 prefix-delegation snooping` .

Example

The following example adds prefix /56.

```
configure bootprelay ipv6 prefix-delegation snooping add 5001:db8:3553:bf00::/56
fe80::a440:cfd5:c05b:d324 vlan v1 valid-time 300
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay ipv6 prefix-delegation snooping

```
configure bootprelay ipv6 prefix-delegation snooping [on {vlan}vlan_name
   | off [{vlan}vlan_name | vlan all] ]
```

Description

Enables and disables snooping of IPv6 prefixes delegated via *DHCP*.

Syntax Description

on	Enables snooping of IPv6 prefixes delegated via DHCP on the specified *VLAN*.
vlan_name	Specifies the VLAN.
off	Disables snooping of IPv6 prefixes delegated via DHCP on the specified VLAN.
vlan all	Disables snooping of IPv6 prefixes delegated via DHCP on all VLANs.

Default

By default, snooping of IPv6 prefixes is off.

Usage Guidelines

You can enable snooping on a specific VLAN.

You can disable the snooping on a specific VLAN or all VLANs.

Example

The following example disables snooping of IPv6 prefixes on all VLANs.

```
configure bootprelay ipv6 prefix-delegation snooping off vlan all
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure bootprelay vlan include-secondary

```
configure bootprelay {ipv4 | ipv6} {vlan vlan_name} include-secondary
   {sequential | parallel | off}
```

Description

Configures *DHCP* smart relay mode to include secondary IP address as giaddr at *VLAN* level.

Syntax Description

ipv4	Specifies DHCPv4 BOOTP Relay service (default).
ipv6	Specifies DHCPv6 BOOTP Relay service.
vlan	Configure BOOTP relay for this VLAN, and overrides the VR level configuration.
vlan_name	Specifies the VLAN name.
include-secondary	(Optional) Use both primary and secondary address(es) of the client VLAN as gateway address.
sequential	Use primary and secondary address(es) of client VLAN in sequence after 3 retries (default if include-secondary is on).
parallel	Use primary and secondary address(es) of client VLAN in parallel.
off	Disable use of both primary and secondary address(es) of client VLAN as gateway address (default).

Default

IPv4 is the default relay service.

off is the default value, but **sequential** is the default if **include-secondary** is on.

Usage Guidelines

Use this command to configure DHCP smart relay mode to include the secondary IP address as giaddr at the VLAN level.

Example

The following command configures DHCPv4 BOOTP Relay service for the "vlan_100" VLAN, and uses both primary and secondary address(es) of the client VLAN as gateway address. This overrides the VR level configuration.

```
configure bootprelay ipv4 vlan vlan_100 include-secondary
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp cos-extend ports

```
configure cdp cos-extend cos_value ports [port_list | all]
```

Description

This command configures COS extended support on the IP phone. This information will be sent to the IP phone from the ExtremeXOS switch by trust TLV and COS TLV.

Syntax Description

cos_value	COS value range from 0 to 7.
port_list	Port list separated by a comma or -";

Default

0.

Usage Guidelines

None.

Example

The following example sets the COS TLV value as 4 for port 5 in the ExtremeXOS switch, which will be used by the IP phone to override priority received from PC or the attached device.

```
configure cdp cos-extend 4 ports 5
```

The following example sets the COS TLV value to default for port 5 in the ExtremeXOS switch.

```
configure cdp cos-extend 0 ports 5
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp device-id

`configure cdp device-id [`*`device_id`* `|` **`system-mac`** `|` **`system-name`**`]`

Description

Configures the device ID only in CDP.

Syntax Description

device-id	Unique device identifier to be used in CDP.
system-mac	Use system MAC address as the device identifier.
system-name	Use sysName as the device identifier (default).

Default

system-name.

Usage Guidelines

Use this command to configure the Device ID. If you do not configure it, the MAC address is used as the Device ID. This configuration of device ID is only used in the CDP .

Example

The following command configures the device ID as the MAC address:

```
configure cdp device-id system-mac
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp frequency

```
configure cdp frequency seconds
```

Description

Enables CDP on a port.

Syntax Description

seconds	Specifies the transmit frequency in seconds. The range is 5,254 seconds. The default value is 60 seconds.

Default

60 seconds.

Usage Guidelines

Example

The following command configures the CDP frequency as two minutes:

```
configure cdp frequency 120
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp hold-time

```
configure cdp hold-time seconds
```

Description

Configures the hold time of the neighbor information .

Syntax Description

seconds	Duration in seconds that receiver must keep this packet. The range is 10-255 and the default is 180 seconds.

Default

60 seconds.

Usage Guidelines

Use this command to configure the hold time of the neighbor information for which a receiving device should hold information before discarding it.

Example

The following command configures the CDP hold time as two minutes:

```
configure cdp hold-time 120
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp management-address

```
configure cdp management-address [{vlan} vlan_name | vlan vlan_id]
   {primary-ip | secondary-ip secondary_ip_address}]
```

Description

Configures a specified VLAN's IP address as the management address to be advertised by Cisco Discovery Protocol (CDP).

Syntax Description

vlan	Specifies a VLAN for the management IP address.
vlan_name	Specifies a VLAN name for the management IP address (default is "Mmgt").
vlan_id	Specifies a VLAN ID for the management IP address.
primary-ip	CDP advertises the primary IP address of the specified VLAN (default). The specified VLAN must be already configured with at least one primary IPv4 or IPv6 address.
secondary-ip	Specifies that CDP advertises the secondary IP address of the specified VLAN. The specified secondary IP address must already be configured on the specified VLAN.
secondary_ip_address	Specifies the secondary IP address of the specified VLAN.

Default

By default, the Management VLAN's IP address is advertised by CDP.

If you do not specify, CDP advertises the primary IP address of the specified VLAN.

Usage Guidelines

If the Management VLAN IP address is not configured, you can specify any user-defined VLAN's IP address or front panel port VLAN's IP address as the management address for the CDP protocol.

This command dictates the management address to be advertised by the CDP protocol; the equivalent command for *LLDP* is configure lldp management-address on page 761.

To use this command, the specified VLAN must already exist. The management IP address configuration is removed if the specified VLAN is deleted, or if the primary IP address of the specified VLAN is deleted (if **primary-ip** configured), or if the specified secondary IP address of the specified VLAN is deleted (if **secondary-ip** configured).

If **primary-ip** is configured and the specified VLAN has multiple primary IP addresses (IPv4 and IPv6), then CDP advertises the first primary IP address that exists in the address table. If IPv4 is not configured, CDP advertises the first IPv6 address.

If **secondary-ip** is configured and the specified VLAN has multiple secondary IP addresses, then CDP advertises only the specified secondary IP address of the configuration.

Example

The following example configures the primary IP address of the VLAN "vlan1" as the management address to be advertised by CDP protocol:

```
configure cdp management-address vlan vlan1 primary-ip
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp power-available ports

```
configure cdp power-available [advertise | no-advertise] ports
   [port_list | all]
```

Description

This command configures the advertising status of the power available TLV on CDP ports.

Syntax Description

advertise	Specifies to send the TLV to neighbors.
no-advertise	Specifies not to send the TLV to neighbors.
port_list	Port list separated by a comma or - .

Default

No-advertise.

Usage Guidelines

This command is for *PoE* switches.

Example

The following example advertises the Power Available TLV on port 1:

```
configure cdp power-available advertise ports 1
```

The following example does not advertise the Power Available TLV on port 1:

```
configure cdp power-available no-advertise ports 1
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp trust-extend ports

```
configure cdp trust-extend [untrusted | trusted] ports [port_list | all]
```

Description

This command configures trust mode support for the IP phone. This information will be sent to the IP phone from the ExtremeXOS switch by trust TLV.

Syntax Description

untrusted	Instructs attached IP phone to overwrite priority received from PC with configured COS value.
trusted	Instructs IP phone to trust the priority received from PC or the attached device.
port_list	Port list separated by a comma or -'';

Default

Trusted.

Usage Guidelines

None.

Example

The following example sets the trust TLV value as trusted for port 5 in the ExtremeXOS switch, which will be used by the IP phone to not change the priority received from the PC or attached device.

```
configure cdp trust-extend trusted ports 5
```

The following example sets the trust mode to untrusted for port 5 in the ExtremeXOS switch, which will be used by the IP phone to override priority received from the PC or attached device.

```
configure cdp trust-extend untrusted ports 5
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cdp voip-vlan ports

```
configure cdp voip-vlan advertise [solicited | unsolicited] [vlan_name |
   vlan_id | dot1p | untagged | none] ports [port_list | all]
```

Description

This command configures voice *VLAN*, for voice traffic from the IP phone in one or more ports in ExtremeXOS switch. This information will be sent to IP phone from the ExtremeXOS switch by VOIP Reply TLV.

Syntax Description

vlan_name	VLAN name.
vlan_id	VLAN ID tag between 1 and 4,094.
advertise	Configures when TLVs are sent to neighbors.
solicited	Send TLVs to neighbors only when requested (default).
unsolicited	Send TLVs to neighbors without waiting for a request.
dot1p	Instructs IP phone to send dot1p tagged voice traffic.
untagged	Instructs IP phone to send untagged voice traffic.
none	No VLAN information is sent in CDP PDUs.
port_list	Port list is separated by a comma or -";
all	Instructs IP phone to send all traffic.

Default

By default, voice VLAN reply TLV are sent to neighbors only when requested.

Usage Guidelines

None.

Example

The following example sets the VOIP VLAN reply TLV value value as default in ExtremeXOS for port, which will be used by the IP phone for voice traffic:

```
Configure cdp voip-vlan “Default” ports 5
```

The following example sets the VOIP VLAN reply TLV value as priority tagged in ExtremeXOS switch for port 5, which will be used by the IP phone for voice traffic.

```
configure cdp voip-vlan dot1p  ports 5
```

The following example sets the VOIP VLAN reply TLV value as untagged in ExtremeXOS switch, which will be used by the IP phone for voice traffic.

```
configure cdp voip-vlan untagged  ports 5
```

The following example sets the VOIP VLAN reply TLV value as none in ExtremeXOS switch, this will not transmit any VLAN information TLV to the IP phone.

```
configure cdp voip-vlan none  ports 5
```

The following example sets the VOIP VLAN reply TLV value as VLAN Id 1 in ExtremeXOS switch for port 5, which will be used by the IP phone for voice traffic.

```
configure cdp voip-vlan 1 ports 5
```

To configure VoIP VLAN as unsolicited on port 10:

```
configure cdp voip-vlan advertise unsolicited ports 10
```

History

This command was first available in ExtremeXOS 21.1.

Ability to send voice VLAN reply TLV without receiving voice VLAN request TLV (unsolicited) was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain add association integer

```
configure cfm domain domain_name add association integer int [vlan
   vlan_name|vman vman_name]
```

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the 2-octet integer MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
int	Enter an integer to name the MA. The range is 0 to 65535.
vlan_name	Specifies the *VLAN* you want to assign to this MA. Each MA contains only one VLAN, VMAN, BVLAN or SVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates a 2-octet integer MA (350) that associates the domain brazil and the VLAN admin:

```
configure cfm domain brazil add association integer 350 vlan admin
```

History

This command was first available in ExtremeXOS 11.4.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain add association meg

`configure cfm domain` *`domain_name`* `add association [`**`meg`** *`meg_name`*`]`

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the MEG MA format.

Syntax Description

meg	ITU-T Y.1731 Maintenance Entity Group.
meg_name	MEG name, maximum of 12 characters with 6 bytes ITU Carrier Code and 6 bytes Organization specific Unique MEG ID Code.

Default

N/A.

Usage Guidelines

All ports configured on the specified MEG are now CFM ports in the specified MA.You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain add association string

```
configure cfm domain domain_name add association string name [vlan
   vlan_name|vman vman_name]
```

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the character string MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
string	Enter up to 45 alphanumeric characters to name the MA.
vlan_name	Specifies the *VLAN* you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates an MA named service that associates the MD spain and the VLAN finance:

```
configure cfm domain service add association string spain vlan finance
```

History

This command was first available in ExtremeXOS 11.4.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain add association vlan-id

```
configure cfm domain domain_name add association vlan-id vlanid [vlan
   vlan_name|vman vman_name]
```

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the *VLAN* ID MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
vlanid	Specifies the VLAN ID.
vlan_name	Specifies the VLAN you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

History

This command was first available in ExtremeXOS 12.1.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain add association vpn-id oui index

```
configure cfm domain domain_name add association vpn-id oui oui index
   index [vlan vlan_name| meg meg_name|vman vman_name]
```

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the RFC 2685 VPN ID MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
association	IEEE 802.1ag Maintenance Association or ITU-T Y.1731 Maintenance Entity Group
oui	Enter a virtual private network (VPN) Organizational Unique Identifier (OUI) in the format XX:XX:XX as part of the name for the MA.
index	Enter the 32-bit VPN index you want to append to the OUI to name the MA. The range is 0 to 4294967295.
vlan_name	Specifies the *VLAN* you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.
meg	ITU-T Y.1731 Maintenance Entity Group.
meg_name	MEG name, maximum of 12 characters with 6 bytes ITU Carrier Code and 6 bytes organization specific unique MEG ID code.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA. You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates an MA with the VPN ID of 11:22:33 50 that associates the domain spain and the VLAN accounting:

```
configure cfm domain spain add association vpn-id oui 11:22:33 index 50 vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association add remote-mep

```
configure cfm domain domain_name association association_name add
   remote-mep mepid { mac_address mac_address }
```

Description

Allows you to add a remote MEP with the given MEP ID and MAC address to an existing association.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
mepid	Enter the MEP ID of the remote MEP being added. The range is 1 to 8191.
mac_address	Specifies the MAC address for the remote MEP being added.

Default

N/A.

Usage Guidelines

Use this command to add a remote MEP with given MEP ID and MAC address to an existing association. Use the `show cfm detail` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association add

```
configure cfm domain domain_name association association_name [ports
   port_list add [[end-point [up|down] mepid { group group_name } ] |
   [intermediate-point]]
```

Description

This command allows you to create an up MEP, down MEP, intermediate-point (MIP) on a maintenance association, a group. You can also combine different maintenance points.

Combining different Maintenance points is restricted per the following:

- Up MEP and Down MEP in a single association is not allowed.
- Down MEP and MIP in a single association is not allowed.
- More than one Up MEP in a single association is not allowed.
- Up MEP and MIP in a single association is allowed.
- More than one Down MEP in a single association is allowed.
- A group can be created while creating a MEP.
- With CFM Support over VPLS, this command is used to associate pseudo wires of a VPLS service instance to an association & domain.
- Portlist can have only one port configured for a MEP configuration but can have multiple ports in MIP configuration, when Hwaoam is supported on the system.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Specifies the port number(s).
up	Enter the port to be the UP port of the MA; this MEP sends CCM messages to all ports—other than the sending switch port—in this MA on this switch.
down	Enter the port to be the DOWN port of the MA; this MEP sends CCM messages out of the configured physical port.
mepid	Specifies a value for this MEP. The range is 1 to 8191. NOTE: On each MA, each MEPID must be unique.
group	CFM group that binds an LMEP to RMEPS. If not specified, the client does not receive events from the respective RMEPs.
group_name	Group name, maximum of 31 characters.

Default

N/A.

Usage Guidelines

These ports must already be in the MA (*VLAN* or VMAN) prior to assigning a MEP function to them. If you try to assign a port not in the MA as an end-point, the system returns the following message:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

You can also combine different maintenance points. The following are CLI restrictions on MP combinations:

- DOWN and UP MEP cannot be present on the same association
- DOWN MEP and MIP cannot be present on the same association
- UP MEP and MIP can be present on the same association
- Only one UP MEP is allowed in an association
- Multiple DOWN MEPs are allowed in an association

You can configure a total of 32 MIPs on a single switch.

Use the `show cfm` command to verify your configuration.

Example

The following command configures port 1:20 as a MIP on the 350 association in the spain domain:

```
configure cfm domain spain association 350 ports 1:20 add intermediate-point
```

The following command configures port 5:10 to be the UP MEP on the test association in the brazil domain, with a mepid of 500:

```
configure cfm domain brazil association test ports 5:10 add end-point up 500
```

History

This command was first available in ExtremeXOS 11.4.

This command was updated in ExtremeXOS 15.2 to include the optional group parameter.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association delete remote-mep

```
configure cfm domain domain_name association association_name delete
   remote-mep mepid
```

Description

Allows you to delete a remote MEP for a specific MEP ID and MAC address.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
mepid	Enter the MEP ID of the remote MEP that is to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete a remote MEP of an MA for a specific MEP ID.

Use the `show cfm detail` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association delete

```
configure cfm domain domain_name association association_name [ports
   port_list delete [[end-point [up|down]] | [intermediate-point] ] ]
```

Description

Deletes a maintenance end point (MEP) or maintenance intermediate point (MIP) from that MA.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name
port_list	Specifies the port number(s).
up	Specifies that an UP MEP is to be deleted.
down	Specifies that a DOWN MEP is to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete an MEP or MIP.

If the VPLS option is chosen then the CFM deletes all the VPLS-based MIPs.

Use the `show cfm` command to verify your configuration.

Example

The following command deletes port 5:12 as an MIP on the test association in the brazil domain:

```
configure cfm domain brazil association test ports 5:12 delete intermediate-point
```

The following command deletes an UP MEP on port 5:10 on the test association in the brazil domain:

```
configure cfm domain brazil association test ports 5:10 delete end-point up
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association destination-mac-type

```
configure cfm domain domain-name association association_name
   destination-mac-type [unicast | multicast]
```

Description

Allows you to choose the destination MAC type for sending CFM PDUs for an MA.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
unicast	CFM PDUs are sent to the unicast MAC address configured in static remote MEP creation.
multicast	CFM PDUs are sent to the standard multicast destination address.

Default

Multicast.

Usage Guidelines

Use this command to change the MAC type on a previously configured MA. If multicast is selected, CFM PDUs are sent to the standard multicast destination. If unicast is selected, CFM PDUs are sent to the unicast MAC address configured in static remote MEP creation.

Use the `show cfm` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association end-point add group

```
configure cfm domain domain-name association association-name ports
   port-list end-point [up | down] add group group_name
```

Description

This command allows you to create a group for an existing local end-point.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.

Default

N/A.

Usage Guidelines

Use this command to add a group to the association.

Example

```
configure cfm domain "MD1" association "MD1v1" ports 17 end-point down add group
"eapsCfmGrp"
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association end-point delete group

```
configure cfm domain domain_name association association_name ports
   port_list end-point [up|down] delete group [group_name | all ]
```

Description

This command allows you to delete one or all groups.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.
delete	Delete configuration from the association

Default

N/A.

Usage Guidelines

Use this command to delete one or all groups from the association.

Example

```
configure cfm domain "MD1" association "MD1v1" ports 17 end-point down delete group
"eapsCfmGrp"
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association end-point transmit-interval

```
configure cfm domain domain_name association association_name {ports
   port_list end-point [up | down]} transmit-interval [3|10|100|1000|
   10000|60000|600000]
```

Description

Allows you to change time interval for an MEP to send out a CCM. We recommend configuring this value as at least 1 second.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number of the MEP on which you are changing the time interval it sends out a CCM.
up	Enter this variable if you are changing the time interval for sending a CCM on an UP MEP.
down	Enter this variable if you are changing the time interval for sending a CCM on a DOWN MEP.

Default

1000 ms.

Usage Guidelines

Use this command to change the time interval between sending out CCMs on a previously configured UP or DOWN MEP. If you attempt to change the interval on a port that is either not an MEP or having wrong MEP type, the system returns an error message.

Note

We recommend that you use a transmit interval of at least 1 second (1000 ms).

The receiving system also uses this value multiplied by 3.5 to determine when the MEP is no longer alive.

Use the `show cfm` command to verify your configuration and the `show cfm detail` command to display the configured lifetime.

Note

The transmit interval value “3” is 3.3 msec. Also, the values 60000 and 600000 are supported in hardware.

Example

The following command changes the interval the UP MEP (previously configured on port 2:4) uses to send CCM messages on the 350 association in the finance domain to 10 seconds:

```
configure cfm domain finance association 350 ports 2:4 end-point up transmit-interval
10000
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association ports end-point ccm

configure cfm domain *domain_name* **association** *association_name* **ports** *port_list* **end-point** [**up** | **down**] **ccm** [**disable** | **enable**]

Description

This command is used to enable or disable sending CCMs on a given MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.

Default

Enabled.

Usage Guidelines

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

These ports must already be in the MA (*VLAN* or VMAN) prior to assigning a MEP function to them. If you try to assign a port not in the MA as an end-point, the system returns the following message:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Use the `show cfm` command to verify your configuration.

Example

```
configure cfm domain "MD1" association "MD1v1" ports 17 end-point down delete group
"eapsCfmGrp"
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association ports end-point mepid

```
configure cfm domain domain-name association association_name ports
   port_list end-point [up | down] mepid mepid
```

Description

Allows you to change the MEP ID for a previously configured MEP. Each MEP within a single MA must have a unique MEP ID.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number you want to change the MEP ID.
up	Enter this variable if you are changing the MEP ID on an UP MEP.
down	Enter this variable if you are changing the MEP ID on a DOWN MEP.
mepid	Enter the new value for this MEP. The range is 1 to 8191. NOTE: On each MA, each MEPID must be unique.

Default

N/A.

Usage Guidelines

Use this command to change the MEPID on a previously configured UP or DOWN MEP. If you attempt to change the MEPID on a port that is either not an MEP or having wrong MEP type, the system returns an error message.

Use the `show cfm` command to verify your configuration.

Example

The following command changes the MEP ID to 75 on the previously configured port 2:4 UP MEP on the 350 association in the finance domain:

```
configure cfm domain finance association 350 ports 2:4 end-point up mepid 75
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association ports end-point sender-id-ipaddress

```
configure cfm domain domain_name association association_name ports
   port_list end-point [up | down ] sender-id-ipaddress [disable |
   enable ip-address]
```

Description

This command is used to disable or enable configuring the sender-id-ipaddress on a given MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Enter the port number.
ip-address	Specifies the IP address that is sent in the sender-id TLV of the CFM PDUs.

Default

Disable.

Usage Guidelines

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

You must create the MEP for which the configuration is being made before changing the configuration. Otherwise, the following error message is displayed:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Use the `show cfm` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association ports end-point

```
configure cfm domain domain_name association association_name ports
   port_list end-point [up | down] [enable | disable]
```

Description

Enables or disables an MEP.

Syntax Description

domain_name	Specifies the domain name.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
port_list	Specifies the ports to configure.
up	Specifies that the end point is up.
down	Specifies that the end point is down.

Default

MEP is enabled by default.

Usage Guidelines

Use this command to enable or disable an MEP.

Use the `show cfm` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain association remote-mep mac-address

```
configure cfm domain domain-name association association_name remote-mep
   mepid mac-address mac_address
```

Description

Allows you to modify the MAC address of an existing MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.
mepid	Specifies the MEP ID of the remote MEP being modified. The range is 1 to 8191.
mac_address	Specifies the MAC address for the remote MEP being modified.

Default

N/A.

Usage Guidelines

Use this command to modify a remote MEP with given MEP ID and MAC address in an existing association. Use the `show cfm detail` command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain delete association

```
configure cfm domain domain_name delete association association_name
```

Description

Deletes a maintenance association (MA), including all its configured values, from the switch.

Syntax Description

domain_name	Enter the domain associated with the MA you are deleting.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.

Default

N/A.

Usage Guidelines

When you delete an association, or MA, you also remove all its configured values from the switch. These values include all configured MEPs, MIPs, and static remote MEPs.

Example

The following command deletes the MA test, in the domain of brazil, from the switch, along with all its configured MIPs, MEPs, and static remote MEPs:

```
configure cfm domain brazil delete association test
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm domain md-level

```
configure cfm domain domain_name md-level level
```

Description

Changes a previously configured MD level for the specified domain.

Syntax Description

domain_name	Enter the name of the domain for which you want to change the MD level.
level	Specifies the new MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level. Thus, a given MD level exists only once one a switch.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command changes the MD level of a previously created domain extreme to 2:

```
configure cfm domain extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm group add rmep

`configure cfm group` *group_name* **`add rmep`** *mepid*

Description

This command allows you to create and associate an RMEP to a group.

Syntax Description

mepid	Specifies the MEP ID of the remote MEP being created. The range is 1 to 8191.

Default

N/A.

Usage Guidelines

Use this command to create and associate an RMEP to a group.

Example

```
configure cfm group "eapsCfmGroup" add rmep 2
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm group delete rmep

```
configure cfm group group_name delete rmep [mepid | all]
```

Description

This command allows you to delete one or all RMEPs from a group.

Syntax Description

mepid	Specifies the MEP ID of the remote MEP being created. The range is 1 to 8191.

Default

N/A.

Usage Guidelines

Use this command to delete one or all RMEPs from a group.

Example

```
configure cfm group "eapsCfmGroup" delete rmep 2
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment add domain association

```
configure cfm segment segment_name add domain domain_name association
   association_name
```

Description

Adds a CFM domain and association to a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
domain_name	Specifies the IEEE 802.1ag maintenance domain.
association_name	IEEE 802.1ag or ITU-T Y.1731 association name.

Default

N/A.

Usage Guidelines

Use this command to add a CFM domain and an association to a CFM segment. It is used to enable DMM/DMR in the association that is configured in the CFM domain.

Example

The following command adds the domain cfm3 and the association as3 to the segment s2.

```
configure cfm segment s2 add domain cfm3 association as3
```

To delete the domain and/or association, use the command, `configure cfm segment delete domain association`.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment delete domain association

```
configure cfm segment segment_name delete domain association
```

Description

Deletes a CFM domain from a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to delete a CFM domain from a CFM segment.

Example

The following command deletes the domain and association from the segment s2.

```
configure cfm segment s2 delete domain association
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment dot1p

```
configure cfm segment segment_name dot1p dot1p_priority
```

Description

Configures the priority for the segment.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

The default is 6.

Usage Guidelines

Use this command to configure the dot1p priority that a DMM/DMR frame can get.

Example

The following example configures a dot1p priority of 3 for segment s2.

```
configure cfm segment s2 dot1p 3
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-delay dot1p

`configure cfm segment` *segment_name* **`frame-delay dot1p`** *dot1p_priority*

Description

This command configures the class of service for a particular cfm segment. This value is used to fill the dot1p priority bit in the Ethernet header during transmission.

If the optional keyword **`frame-delay`** is not specified, the same value of Dot1p will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

N/A.

Usage Guidelines

Use this command to configure the class of service for a particular cfm segment.

Example

```
configure cfm segment frame-delay dot1p 4
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-delay window

`configure cfm segment` *`segment_name`* **`frame-delay window`** *`window_size`*

Description

This command is used to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM. This window size denotes the total number of recent frames for which the threshold values will be measured.

If the optional keyword frame-delay or frame-loss is not specified, the same value of window size will be used for both DMM and LMM. The optional keyword allows configuring values for DMM and LMM.

Syntax Description

`segment_name`	Alphanumeric string identifying the segment name.
`frame-delay`	Y.1731 Ethernet frame delay measurement.
`window_size`	Window size for delay measurement; number of frames 1-1800 to be used.

Default

60.

Usage Guidelines

Use this command to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM.

Example

```
configure cfm segment cs2  frame-delay window 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-delay/frame-loss transmit interval

```
configure cfm segment segment_name {frame-delay | frame-loss} transmit-
   interval interval
```

Description

Configures the delay between two consecutive DMM/LMM frames.

Syntax Description

segment_name	Alphanumeric string identifying the segment name.
frame-delay	Y.1731 Ethernet frame delay measurement.
frame-loss	Y.1731 Ethernet frame loss measurement.
interval	Trasmit interval in seconds, with a range of 1 to 90.

Default

N/A.

Usage Guidelines

Configures the delay between two consecutive DMM/LMM frames. The configured delay would be for both continuous and on-demand transmission. This command is optional, and if not configured, the default interval would be 10 seconds.

If the optional keyword frame-delay or frame-loss is not specified, the same value of transmit-interval will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Example

```
configure cfm segment cs2  frame-delay transmit-interval 10
configure cfm segment cs2  frame-loss  transmit-interval 10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-loss consecutive

```
configure cfm segment segment_name frame-loss consecutive frames
```

Description

This command is used to configure the number of consecutive measurements to be used to determine the availability status of a CFM segment.

Syntax Description

segment_name	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.

Default

10.

Usage Guidelines

This configuration is optional.

Example

```
configure cfm segment cs2  frame-loss   consecutive 10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-loss dot1p

```
configure cfm segment segment_name frame-loss dot1p dot1p_priority
```

Description

This command configures the class of service for a particular cfm segment. This value is used to fill the dot1p priority bit in the Ethernet header during transmission.

If the optional keyword frame-loss is not specified, the same value of Dot1p will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

N/A.

Usage Guidelines

Use this command to configure the class of service for a particular cfm segment.

Example

```
configure cfm segment frame-loss dot1p 4
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-loss mep

configure cfm segment *segment_name* **frame-loss** [**add**|**delete**] **mep** *mep_id*

Description

This command is used to add/delete the local MEP for a given CFM segment.

Syntax Description

segment_name	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.

Default

N/A.

Usage Guidelines

The MEP with the given MEP ID should already be created in the system. The domain and association for the segment should be configured before executing this command. If the domain and association are not configured, the command throws an error.

Configuring of local MEP is mandatory to start the Frame Loss measurements.

Example

```
configure cfm segment cs2  add mep 3
configure cfm segment cs2  delete mep 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-loss ses-threshold

`configure cfm segment` *`segment_name`* **`frame-loss ses-threshold`** *`percent`*

Description

This command is used to configure the percentage of frames lost in a measurement period for it to be marked as SES (Severely Errored Second).

Syntax Description

`segment_name`	Alphanumeric string identifying the segment name.
`ses`	Severely errored second.
`frame-loss`	Y.1731 Ethernet frame loss measurement.

Default

30%.

Usage Guidelines

This configuration is optional.

Example

```
configure cfm segment cs2  frame-loss  ses-threshold .02
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment frame-loss window

```
configure cfm segment segment_name frame-loss window window_size
```

Description

This command is used to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM. This window size denotes the total number of recent frames for which the threshold values will be measured.

If the optional keyword frame-delay or frame-loss is not specified, the same value of window size will be used for both DMM and LMM. The optional keyword allows configuring values for DMM and LMM.

Syntax Description

segment_name	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.
window_size	Window size for loss measurement; number of frames 1-1800 to be used.

Default

1200.

Usage Guidelines

Use this command to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM.

Example

```
configure cfm segment cs2  frame-loss  window 900
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment threshold

```
configure cfm segment segment_name [alarm-threshold | clear-threshold]
   value
```

Description

Configures the alarm threshold and clear threshold.

Syntax Description

alarm-threshold	Specifies the minimum threshold percentage.
clear-threshold	Specifies the maximum threshold percentage.
value	Specified the threshold percentage in a range of 1-99%.

Default

Alarm threshold is 10% of the total frames received during the current window.

Clear-threshold is 95% of the total frames received during the current window.

Usage Guidelines

Use this command to configure the alarm and clear threshold value for a CFM segment. Upon reaching the alarm threshold, an error message is generated and displayed once, and the state is maintained until the threshold reaches the clear threshold value.

This command is optional, and if not configured the default intervals are used.

Example

The following commands configure an alarm threshold of 15% and a clear-threshold of 90% for segment-first.

```
configure cfm segment segment-first alarm-threshold 15
configure cfm segment segment-first clear-threshold 90
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment timeout

```
configure cfm segment segment_name timeout msec
```

Description

Configures the timeout for a segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
msec	Specifies the number of milliseconds. The range is 1 to 65535.

Default

50 milliseconds.

Usage Guidelines

Use this command to configure the timeout value for the reception of a DMR frame. If a DMR frame is not received within this specified time, that frame is considered as an errored frame, and if the number of errored frames reaches the alarm threshold of the current window size, an alarm is generated.

This command is optional, and if not configured, timeout is set to the default.

Example

The following command configures a timeout value of 45 milliseconds for the s4 segment:

```
configure cfm segment s4 timeout 45
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment transmit-interval

```
configure cfm segment segment_name {frame-delay | frame loss}transmit-
   interval interval
```

Description

Configures the transmission interval of DMM frames.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
frame-delay	Y.1731 Ethernet Frame Delay Measurement.
frame loss	Y.1731 Ethernet Frame Loss Measurement.
interval	Specifies the transmit interval in seconds. The range is 1 to 90.

Default

10 seconds.

Usage Guidelines

Use this command to configure the delay between two consecutive DMM frames. The configured delay is for both continuous and on-demand transmission. This command is optional, and if not configured the default interval is used.

Example

The following example configures a transmission interval of 5 seconds for segment s2.

```
configure cfm segment s2 transmit-interval 5
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cfm segment window

`configure cfm segment` *segment_name* **window** *size*

Description

Configures the measurement window size.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
size	Specifies the number of frames to be used for delay measurement. The range is 1 to 1800.

Default

60 frames.

Usage Guidelines

Use this command to configure the window size to be used for calculating the threshold values. This window size denotes the total number of recent frames for which the threshold values are to be measured.

This is an optional command and if not configured, the lower of either the default value or the total number of frames sent is used.

Note

MEPs with intervals 3 and 10 cannot be created in this domain as the domain name format is of dns type.

Example

The following command configures the measurement window size for the CFM segment segment-first at 55:

```
configure cfm segment segment-first window 55
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli

```
configure cli [{ lines height } {columns width }]
```

Description

This command configures the number of lines and columns for the current login session only.

Syntax Description

lines	Number of lines on the screen.
height	Height of the screen.
columns	Number of columns on the screen.
width	Width of the screen.

Default

N/A.

Usage Guidelines

The screen size specified takes effect over whatever screen size the session may have started with or whatever the current settings may be. If the terminal emulation supports dynamic resizing of the window, this will cause the size set by this command to be overriden. The command accepts either lines or columns or both in either order.

Example

The show management command has been enhanced to display the current screen size:

```
# show management
CLI idle timeout                  : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions        : 8
CLI paging                        : Enabled (this session only)
CLI space-completion              : Disabled (this session only)
CLI configuration logging         : Disabled
CLI password prompting only       : Disabled
CLI scripting                     : Disabled (this session only)
CLI scripting error mode          : Ignore-Error (this session only)
CLI persistent mode               : Persistent (this session only)
CLI prompting                     : Enabled (this session only)
CLI screen/window size            : 80 Lines 256 Columns (this session only)
CLI refresh                       : Enabled
Telnet access                     : Enabled (tcp port 23 vr all)
                                  : Access Profile : not set
SSH Access                        : ssh module not loaded.
Web access                        : Enabled (tcp port 80)
                                  : Access Profile : not set
Total Read Only Communities       : 1
Total Read Write Communities      : 1
RMON                              : Disabled
SNMP access                       : Enabled
                                  : Access Profile : not set
SNMP Notifications                : Enabled
SNMP Notification Receivers  : None
SNMP stats:    InPkts 0       OutPkts   0       Errors 0       AuthErrors
0
               Gets   0       GetNexts  0       Sets   0       Drops       0
SNMP traps:     Sent  0       AuthTraps Enabled
SNMP inform:    Sent  0       Retries   0       Failed 0
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli journal

```
configure cli journal size size
```

Description

This command configures the size of the historical list (journal) of the most recently executed CLI commands.

Syntax Description

journal	List of the most recently executed CLI commands.
size *size*	Configures the size (number) of remembered commands. Range is 50 to 200 (default = 100).

Default

One hundred commands are preserved in the journal by default.

Usage Guidelines

The journal retains as many as 200 of the most recently executed commands along with the timestamp and user name. Commands are saved even after logging off, rebooting, or switch crashes.

To view the journal, use the `show cli journal` command.

Example

The following example sets the journal size to 150:

```
configure cli journal size 150
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli max-failed-logins

```
configure cli max-failed-logins num-of-logins
```

Description

Establishes the maximum number of failed logins permitted before the session is terminated.

Syntax Description

num-of-logins	Specifies the maximum number of failed logins permitted; the range is 1 to 10.

Default

The default is three logins.

Usage Guidelines

The value must be greater than 0; the range is 1 to 10.

Example

The following command sets the maximum number of failed logins to five:

```
configure cli max-failed-logins 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli max-sessions

```
configure cli max-sessions num-of-sessions
```

Description

Limits number of simultaneous CLI sessions on the switch.

Syntax Description

num-of-sessions	Specifies the maximum number of concurrent sessions permitted. The range is 1 to 16.

Default

The default is eight sessions.

Usage Guidelines

The value must be greater than 0; the range is 1 to 16.

Example

The following command limits the number of simultaneous CLI sessions to ten:

```
configure cli max-sessions 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli mode

```
configure cli mode [persistent | non-persistent]
```

Description

Configures the persistent nature of command execution for non-persistent commands.

Syntax Description

persistent	Configures command execution to be persistent.
non-persistent	Configures command execution to be not persistent.

Default

The default mode is non-persistent.

Usage Guidelines

All ExtremeXOS commands can operate in persistent mode, and a subset of the ExtremeXOS command set can operate in non-persistent mode. Commands that are executed in persistent mode become part of the saved switch configuration that persists when the switch is rebooted. Commands that are executed in non-persistent mode configure temporary changes that are not saved in the switch configuration and do not persist when the switch is rebooted.

Most commands operate only in persistent mode. The subset of commands that operate in non-persistent mode are called non-persistent-capable commands. The Universal Port feature uses the non-persistent-capable commands to configure temporary changes that could create security issues if the switch were rebooted or reset. The use of non-persistent-capable commands in scripts and Universal Port profiles allows you to make temporary configuration changes without affecting the default configuration the next time the switch is started.

The configure cli mode command affects only the non-persistent-capable commands, which are listed in the Universal Port chapter in the *Switch Engine 32.2 User Guide*. By default, all commands operate in persistent mode with the following exceptions:

- In Universal Port dynamic profiles, the non-persistent-capable commands operate in non-persistent mode unless preceded by the configure cli mode persistent command in the profile.
- In the CLI, CLI scripts, and static profiles, the non-persistent-capable commands operate in non-persistent mode only when preceded by the configure cli mode non-persistent command.

You can use the configure cli mode persistent command and the configure cli mode non-persistent command to change the mode of operation for non-persistent-capable commands multiple times within a script, profile, or configuration session.

Example

The following example sets command execution to be persistent:

```
configure cli mode persistent
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli mode scripting

```
configure cli mode scripting [abort-on-error | ignore-error]
```

Description

Configures the error handling process for CLI scripting on the switch.

Syntax Description

abort-on-error	Configures Cli scripts to be aborted if a CLI error occurs.
ignore-error	Configures the script to be executed when CLI errors occur.

Default

CLI: ignore-error Static profiles: abort-on-error Dynamic profiles: abort-on-error

Usage Guidelines

You can change the error-handling options within the scripts.

Example

The following command configures the switch to ignore syntax errors in CLI scripts:

```
configure cli mode scripting ignore-error
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli moved-keywords

configure **cli moved-keywords** [**hide** | **show** {**no-help**}]

Description

Controls how old keywords that have been moved and redefined appear in the CLI.

Syntax Description

cli	Configures aspects of the CLI.
moved-keywords	Selects CLI keywords that were moved or processing options that were renamed.
hide	Deprecates old-moved keywords to hide them from help display.
show	Shows old-moved keywords and corresponding redirection help text. (Default)
no-help	Shows old-moved keywords, but does not show redirection help text.

Default

By default, the **show** option is in effect.

Usage Guidelines

ExtremeXOS has evolved and incorporated many new features over time. During this development, CLI keywords have been introduced that are not logically organized or do not conform to the CLI format standards. This command provides a way to manage how old keywords that have been moved and redefined appear in the CLI.

The option you select with this command, and if you elect to hide commands, which version of ExtremeXOSversion was running when the hide command was issued, appear in the output of the `show management`.

Example

The following example shows old commands and displays help text:

```
# configure cli moved-keywords show
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli password prompting-only

```
configure cli password prompting-only [ on | off ]
```

Description

This command allows you to configure prompting (with no echo) for all passwords, secrets, or keys.

Syntax Description

prompting-only	Prompting is required when entering passwords, keys, and secrets. The default is off.
on	Enable the option.
off	Disable the option.

Default

Off.

Usage Guidelines

Use this command to configure prompting (with no echo) for all passwords, secrets, or keys. Each CLI command with password arguments will be modified to use the new mode (designated with

flags="prompting-only" in the CLI syntax attribute specification). Prompting must be handled in the action script for that command.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli script path

```
configure cli script path path
```

Description

Creates a search path for the **run/load script filename** command.

.

Syntax Description

path	Defines the colon-separated list of directories to search for CLI scripts. Default is `.:/usr/local/cfg`.

Default

`.:/usr/local/cfg`

Usage Guidelines

This setting only applies to the current session. This command must be added to `exshrc.xsf` in order to be persistent.

Example

The following example configures the default script search path:

```
configure cli script path
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli script timeout

```
configure cli script timeout timeout
```

Description

Configures the maximum time a script can run.

Syntax Description

timeout	Defines the timeout period in seconds.

Default

Regular script: no time limit default.xsf: 500 seconds autoexec.xsf: 500 seconds

Usage Guidelines

This command configures the maximum run time for all scripts, including default.xsf and autoexec.xsf, which are described in *Software Upgrade and Boot Options* section in the *Switch Engine 32.2 User Guide*. If no timeout period is configured, regular scripts do not timeout, and the default.xsf and autoexec.xsf scripts time out after 500 seconds.

If a script does not finish running in the configured time, command execution stops and an error message is logged. If the timer expires while a command is executing, the command execution continues and all following commands are not executed.

If the timer command is executed inside a script, the timer is reset. If the command is issued more than once inside a script the last timer command executed resets the timer. The timer is valid only for that session. The use of nested scripts does not extend the execution period. When the parent script reaches the timeout value, the parent script and all nested scripts terminate.

To configure a different timeout value for autoexec.xsf or default.xsf, the configure cli script timeout command should be the first command in the script.

When a script timeout value is configured, the following variables are created: $CLI.SCRIPT_TIMEOUT and $CLI.SCRIPT_TIME_REMAINING. If no timeout value is configured for a session, the variables are not created.

You can use the $CLI.SCRIPT_TIMEOUT variable to adjust the timeout value. The $CLI.SCRIPT_TIME_REMAINING variable returns the time remaining. When a timeout value is configured, the variable values are as follows:

- If no script is running, both $CLI.SCRIPT_TIME_REMAINING and $CLI.SCRIPT_TIMEOUT show the configured timeout value.
- If a script is aborted due to timeout, the $CLI.SCRIPT_TIME_REMANING variable returns the value0.
- If a script finishes execution (before the timeout value is reached) the $CLI.SCRIPT_TIME_REMANING variable returns the remaining time.

Example

The following example configures the switch to terminate a script after 120 seconds:

```
configure cli script timeout 120
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cos-index

```
configure cos-index cos_index [{ qosprofile qosprofile } {ingress-meter
   ing_meter } {replace-tos tos_value {mask tos_mask}}]
```

Description

This command is used to configure the *CoS (Class of Service)* index, which is used to assign *QoS (Quality of Service)* rate-shaping, rate-limiting, flood control, and 802.1p.

Syntax Description

cos_index	Class of Service (CoS) index value, range 0 - 255.
qosprofile	QoS profile.
qosprofile	QoS profile name.
ingress-meter	Ingress rate-limiter meter.
ing_meter	Ingress rate-limiter meter name.
replace-tos	Replace TS value.
tos_value	TOS replacement value.
mask	TOS replacement mask.
tos_mask	TOS replacement mask value.

Default

N/A.

Usage Guidelines

The CoS index (0-255) is used to assign QoS rate-shaping, rate-limiting, flood control, and 802.1p. The TOS value can be a value from 0-255. The TOS mask option allows for only certain bits of the field, those masked, to be change. If the mask is not specified in the ToS input, all bits are overwritten. The replace-dot1p value cannot be set for CoS indexes 0-7.

For indexes 0-7, the **replace-tos** option for the cos-index command will map to the `configure diffserv` commands, which are associated with the qosprofile, assigned through the `configure dot1p` command. Note that diffserv only replaces bits 0-5 of the TOS byte. Therefore, the replace-tos mask is fixed to 0xfc for cos-index 0-7 and the equivalent diffserv replace value is shifted left 2 bits. On some platforms, the hardware only allows replacement of bits 0-5. In which case, the mask is fixed to 0xfc and will result in an error if the user tries to change the mask.

Example

```
configure cos-index 51 qosprofile qp2 ingress-meter ingmeter2 replace-tos 64
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure database add server

```
configure database database_name add server [host_name | ip_address]
   {port port_number} {password [encrypted encrypted_password |
   password ]}
```

Description

Adds a server to an Automation Edge remote *VXLAN* Network Identifier (VNI)-device database.

Syntax Description

database	Adds a server to a remote VNI-database.
database_name	Adds a server to the named database.
add	Adds a server to the database.
server	Adds a server to the database.
host_name	Provides hostname of the remote database server.
ip_address	Provides the IP address of the remote server.
port	Configures the server TCP port number.
port_number	Specifies the server TCP port number. The default is 6,379.
password	Specifies providing a password for the database.
encrypted	Specifies providing an encrypted password for the database.
encrypted_password	Provides the encrypted password.
password	Provides the password.

Default

If not specified, the server TCP port number is 6,379.

Usage Guidelines

N/A.

Example

The following example adds a server at location 1.1.1.2 with password "secretpassword" to the database "database1":

```
# configure database database1 add server 1.1.1.2 password secretpassword
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure database delete server

```
configure database database_name delete server [host_name | ip_address |
    all]
```

Description

Deletes a server from an Automation Edge remote *VXLAN* network identifier (VNI)-device database.

Syntax Description

database	Deletes server from a remote VNI-database.
database_name	Deletes server from the named database.
delete	Deletes a server from the database.
server	Deletes a from to the database.
host_name	Specifies the hostname of the server to delete from the database.
ip_address	Specifies the IP address of the server to delete from the database.
all	Specifes deleting all servers from the database.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example deletes a server at location 1.1.1.2 from database "database1":

```
# configure database database1 delete server 1.1.1.2
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure database max-retry-interval

configure **database max-retry-interval** *retry_interval*

Description

Specifies the maximum value for exponentially increasing time interval between retries for an Automation Edge remote *VXLAN* network identifier (VNI)-device database.

Syntax Description

database	Makes time interval retries remote VNI-database.
max-retry-interval	Specifies setting the maximum value for exponentially increasing time interval between retries.
retry_interval	Specifies the value for the maximum time interval between retries in seconds. The default is 600. The range is 1 to 3,600.

Default

If not specified, the maximum retry interval is 600 seconds.

Usage Guidelines

N/A.

Example

The following example sets the maximum retry interval to 800 seconds:

```
# configure database max-retry-interval 800
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure database server password

```
configure database database_name server [host_name | ip_address]
   password [encrypted encrypted_password | password ]
```

Description

Updates an existing Automation Edge server in a remote *VXLAN* Network Identifier (VNI)-device database with a new password.

Syntax Description

database	Specifies the server of a database for a password change.
database_name	Specifies the server of the named database for a password change.
server	Specifies the server for a password change.
host_name	Provides hostname of the remote database server.
ip_address	Provides the IP address of the remote server.
password	Specifies providing a password for the database.
encrypted	Specifies providing an encrypted password for the database.
encrypted_password	Provides the encrypted password.
password	Provides the password.

Default

N/A.

Usage Guidelines

N/A.

Example

The following example changes the password for the server at location 1.1.1.2 to "differentpassword" in the database "database1":

```
# configure database database1 server 1.1.1.2 passwor differentpassword
```

History

This command was first available in ExtremeXOS 31.1 as a demonstration feature.

This command is fully supported in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure debug core-dumps

`configure debug core-dumps [ **off** | *directory_path*]`

Description

Enables or disables the sending of core dump files to the internal memory or a USB 2.0 storage device.

Syntax Description

off	Specifies that the switch does not save core dump files to memory or to removable storage devices.
directory_path	Directory path (USB is `/usr/local/ext`; internal memory is `/usr/local/tmp` (default); and home directory is `/usr/local/cfg`.

Default

Beginning with ExtremeXOS 11.6, core dumps to internal memory (`/usr/local/tmp`) is enabled by default.

Usage Guidelines

Note
Use this command only under the guidance of Extreme Networks Technical Support personnel to troubleshoot the switch.

The switch only generates core dump files and writes them to the specified device in the following situations:

- If an ExtremeXOS process fails.
- When forced under the guidance of Extreme Networks Technical Support.

If you configure the switch to write core dump files to the internal memory and attempt to download a new software image, you might have insufficient space to complete the image download. If this occurs, move or delete the core dump files from the internal memory. For example, if the switch supports a removable storage device that has space available, transfer the files to the device. On switches without removable storage devices, transfer the files from the internal memory card to a TFTP server. This frees up space on the internal memory card while keeping the core dump files.

Before you can enable and save debug information to a removable storage device, you must install the device. For more information about installing a removable storage device, refer to the hardware documentation.

After you use the `eject` *`usb-device`* command and manually remove a USB device, you are prompted to select another location to write the debug files to.

Stackables in Stack Mode

This command works only from the master node. If you enable it on stack master, it is applicable for all nodes.

Example

The following example enables a switch to save debug information to a USB device:

```
configure debug core-dumps /usr/local/ext
```

The following example enables the switch to save debug information to internal memory:

```
configure debug core-dumps /usr/local/tmp
```

History

This command was first available in ExtremeXOS 11.1.

The internal-memory parameter was added in ExtremeXOS 11.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

The options **`memorycard`** and **`internal-memory`** were removed and the variable *`directory_path`* was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dhcp ipv6 client identifier-type

```
configure dhcp ipv6 client identifier-type [ link-layer {plus-time} |
   vendor-specific
```

Description

This command configures the DHCPv6 client identifier type for the client. A *DHCP* server uses this identifier-type to identify clients for the selection of configuration parameters.

Syntax Description

dhcp	Configure DHCP
ipv6	Configure DHCP IPv6 client
client	Configure DHCP IPv6 client
identifier-type	Configure DHCP IPv6 client identifier type
link-layer	Configure link-layer address (system MAC) as DHCP IPv6 client identifier
plus-time	Configure link-layer address plus current time as DHCP IPv6 client identifer
vendor-specific	Configure DHCP IPv6 client identifier by prepending the vendor-specific IANA value

Default

IPv4.

Usage Guidelines

Use this command to configure the DHCPv6 client identifier type for the client.

History

This command was first available in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure diagnostics privilege

```
configure diagnostics privilege [admin | user]
```

Description

This command configures the user privilege level needed to view diagnositc results.

Syntax Description

privilege	Configure minimum privilege level needed to view diagnostic results.
admin	Only admin (read-write) accounts can view diagnostic results.
user	User (read-only) accounts can view diagnostic results also (default).

Default

User.

Usage Guidelines

Use this command to configure the privilege level required to view diagnostic results.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure diffserv examination code-point qosprofile

```
configure diffserv examination code-point code_point {qosprofile}
   qosprofile
```

Description

Configures the default ingress DiffServ code point (DSCP) to *QoS* profile mapping.

Syntax Description

code-point	Specifies a DiffServ code point (a 6-bit value in the IP-TOS byte in the IP header). Supported values are 0 to 63.
qosprofile	Specifies the QoS profile to which the DiffServ code point is mapped.

Default

See Table 4 below.

Usage Guidelines

You can specify up to 64 different code points for each port. Code point values are grouped and assigned to the default QoS profiles as shown in the following table.

Table 4: Default DiffServ Code Point-to-QoS Profile Mapping

Code Point	ExtremeSwitching Series Switches QoSProfile
0-7	QP1
8-15	QP1
16-23	QP1
24-31	QP1
32-39	QP1
40-47	QP1
48-55	QP1
56-63	QP8

Example

The following command specifies that code point 25 be assigned to QP2:

```
# configure diffserv examination code-point 25 qosprofile qp2
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure diffserv replacement code-point

```
configure diffserv replacement [{qosprofile} qosprofile | priority
   priority] code-point code_point
```

Description

Configures the egress Diffserv replacement mapping for either a *QoS* profile or an 802.1p priority value.

Syntax Description

qosprofile	Specifies a QoS profile.
priority	Specifies an 802.1p priority value to map to a code point.
code_point	Specifies a 6-bit value to be used as the replacement DSCP in the IPv4 or IPv6 header.

Default

N/A.

Usage Guidelines

Note

We recommend that you use the qosprofile *qosprofile* value to configure this parameter.

Egress packets contain the DSCP assigned to the QoS profile, which can be selected by the 802.1p code point or by an *ACL*. The default 802.1p priority value to QoS profile to DSCP mapping is shown in the following table.

Table 5: Default QoS Profile-to-802.1p Priority Value-to-Code Point

802.1p Priority Value	ExtremeSwitching Series Switches QoS Profile	DSCP
0	QP1	0
1	QP1	8
2	QP1	16
3	QP1	24
4	QP1	32
5	QP1	40
6	QP1	48
7	QP8	56

Example

The following command specifies that a code point value of 5 should be used to replace the DiffServ (TOS) bits in packets in QP2:

```
# configure diffserv replacement qosprofile qp2 code-point 5
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns cache analytics [add | delete] protected-client

```
configure dns cache analytics [add | delete]protected-client [client_ip
   netmask | ipNetmask] {{vr} vr_name}
```

Description

Configures the protected client list for the Domain Name System (DNS) cache analytics for the virtual router (VR).

Syntax Description

dns	Domain Name System.
cache	Specifies configuring DNS cache.
analytics	Specifies configuring DNS cache analytics.
add	Specifies adding to the protected client list.
delete	Specifies deleting from the protected client list.
protected-client	Specifies configuring the protected client list.
client_ip	Specifies the IPv4 network address of the protected client.
netmask	Specifies the IP address netmask of the protected client.
ipNetmask	Specifies the IP address/mask length of the protected client.
vr	Specifies the VR.
vr_name	Specifies the VR name. If not specified, the VR of the current command context is used.

Default

If not specified, by default the VR of the current command context is used.

Usage Guidelines

Administrators can use this command to restrict the collection of DNS analytics for a protected client. When you configure the client IP subnet in the protected list, DNS queries from configured protected clients are erased from the analytics database and future queries are not stored.

Example

The following example adds the client at IP address 192.168.3.3 on VR-Default to the protected client list:

```
# configure dns cache analytics add protected-client 192.168.3.3 255.255.255.255 VR-
Default
```

or

```
# configure dns cache analytics add protected-client 192.168.3.3/32 VR-Default
```

The following example adds the subnet 192.168.3.0 on VR-Default to the protected client list:

```
# configure dns cache analytics add protected-client 192.168.3.0 255.255.255.0 VR-Default
```

or

```
# configure dns cache analytics add protected-client 192.168.3.0/24 VR-Default
```

The following example removes the client 192.168.3.3 on VR-Default from the protected client list:

```
# configure dns cache analytics delete protected-client 192.168.3.3 255.255.255.255 VR-
Default
```

or

```
# configure dns cache analytics delete protected-client 192.168.3.3/32 VR-Default
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns cache add | delete name-server

```
configure dns cache [add | delete ] name-server ip_address {{vr}
   vr_name}
```

Description

Adds or deletes a Domain Name System (DNS) name server.

Syntax Description

dns	Domain Name System.
cache	Specifies adding or deleting DNS name server.
add	Specifies adding a name server.
delete	Specifies deleting a name server.
name-server	Specifies adding or deleting a DNS name server.
ip_address	Specifies the IP address of the DNS name server.
vr	Configures the VR on which the DNS name server is accessible.
vr_name	Specifies the VR on which the DNS name server is accessible. If not specified, the VR of the current command context is used.

Default

If no VR name is specified, the VR of the current command context is used.

Usage Guidelines

You can configure a maximum of 8 name servers.

To view the current DNS name servers, use the command `show` **`dns cache name-server`**.

Example

The following example adds a DNS name server located at 1.1.1.2:

```
# configure dns cache add name-server 1.1.1.2
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns cache analytics

`configure` **`dns cache analytics`** [{**`timeout`** *`minutes`*} {**`max-entries`** *`max_entries`*}]

Description

Configures Domain Name System (DNS) cache analytics.

Syntax Description

`dns`	Domain Name System.
`cache`	Specifies DNS cache.
`analytics`	Specifies configuring DNS analytics.
`timeout`	Specifies setting the timeout period for analyzed DNS queries. After this time, existing entries are flushed.
`minutes`	Specifies the timeout value in minutes. The range is 1 to 1,440. The default is 1,440.
`max-entries`	Specifies the maximum number of analyzed DNS queries in the database. When this limit is met, new entries start replacing old entries.
`max_entries`	Specifies the value for the maximum analyzed queries. The range is 1,000 to 10,000. The default is 10,000.

Default

The default for the timeout period is 1,440 minutes.

The default for the maximum number of entries is 10,000.

Usage Guidelines

If query Q1 is learned at time t1 and the timeout period is configured as 5 minutes, this entry is removed within t1 + 5 minutes.

To manually clear the DNS cache analytics, use the command `clear` **`dns cache analytics entries`** {{**`vr`**} *`vr_name`*}.

Example

The following example sets the maximum number of entries to 2,000:

```
# configure dns cache analytics max-entries 2000
```

The following example sets the timeout period to 500 minutes:

```
# configure dns cache analytics timeout 500
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns-client add

```
configure dns-client add [domain-suffix domain_name | name-server
   ip_address {vr vr_name}]
```

Syntax Description

`domain-suffix`	Specifies adding a domain suffix.
`domain_name`	Specifies a domain name.
`name-server`	Specifies adding a name server.
`ip_address`	Specifies an IP address for the name server.
`vr`	Specifies use of a virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document..
`vr_name`	Specifies a virtual router.

Description

Adds a domain suffix to the domain suffix list or a name server to the available server list for the DNS client.

Default

N/A.

Usage Guidelines

The domain suffix list can include up to six items.

If the use of all previous names fails to resolve a name, the most recently added entry on the domain suffix list will be the last name used during name resolution. This command will not overwrite any exiting entries. If a null string is used as the last suffix in the list, and all other lookups fail, the name resolver will attempt to look up the name with no suffix.

Up to eight DNS name servers can be configured. The default value for the virtual router used by the DNS client option is *VR-Default*.

Example

The following command configures a domain name and adds it to the domain suffix list:

```
configure dns-client add domain-suffix xyz_inc.com
```

The following command specifies that the switch use the DNS server 10.1.2.1:

```
configure dns-client add name-server 10.1.2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns-client default-domain

```
configure dns-client default-domain domain_name
```

Description

Configures the domain that the DNS client uses if a fully qualified domain name is not entered.

Syntax Description

domain_name	Specifies a default domain name.

Default

N/A.

Usage Guidelines

The default domain name will be used to create a fully qualified host name when a domain name is not specified.

For example, if the default domain name is set to “food.com” then when a command like “ping dog” is entered, the ping will actually be executed as “ping dog.food.com”.

Example

The following command configures the default domain name for the server:

```
configure dns-client default-domain xyz_inc.com
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dns-client delete

```
configure dns-client delete [domain-suffix domain_name | name-server
   ip_address {vr vr_name}]
```

Description

Deletes a domain suffix from the domain suffix list or a name server from the available server list for the DNS client.

Syntax Description

domain-suffix	Specifies deleting a domain suffix.
domain_name	Specifies a domain name.
name-server	Specifies deleting a name server.
ip_address	Specifies an IP address for the name server.

vr	Specifies deleting a virtual router. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
vr_name	Specifies a virtual router.

Default

N/A.

Usage Guidelines

Specifying a domain suffix removes an entry from the domain suffix list.

If the deleted item was not the last entry in the list, all items that had been added later are moved up in the list. If no entries in the list match the domain name specified, an error message will be displayed.

The default value for the virtual router used by the DNS client option is *VR-Default*.

Example

The following example deletes a domain name from the domain suffix list:

```
configure dns-client delete domain-suffix xyz_inc.com
```

The following example removes a DNS server from the list:

```
configure dns-client delete name-server 10.1.2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dos-protect acl-expire

```
configure dos-protect acl-expire seconds
```

Description

Configures the denial of service protection *ACL* expiration time.

Syntax Description

seconds	Specifies how long the ACL is in place.

Default

The default is 5 seconds.

Usage Guidelines

This command configures how long the DoS protection ACL remains in place.

Example

This example sets the ACL expiration time to 15 seconds:

```
configure dos-protect acl-expire 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dos-protect interval

```
configure dos-protect interval seconds
```

Description

Configures the denial of service protection interval.

Syntax Description

seconds	Specifies how often the DoS protection counter is monitored.

Default

The default is one second.

Usage Guidelines

This command configures how often the DoS protection counter is monitored.

Example

This example sets the interval to 5 seconds:

```
configure dos-protect interval 5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dos-protect trusted ports

```
configure dos-protect trusted-ports [ports [ports | all] | add-ports
   [ports-to-add | all] | delete-ports [ports-to-delete | all]]
```

Description

Configures the list of trusted ports.

Syntax Description

ports	Specifies the trusted ports list.
ports-to-add	Specifies the ports to add to the trusted ports list.
all	Specifies all the ports.
ports-to-delete	Specifies the ports to delete from the trusted ports list.

Default

N/A.

Usage Guidelines

Traffic from trusted ports will be ignored when DoS protect counts the packets to the CPU. If we know that a machine connected to a certain port on the switch is a safe "trusted" machine, and we know that we will not get a DoS attack from that machine, the port to which this machine is connected can be configured as a trusted port, even though a large amount of traffic is going through this port.

Example

This example sets the trusted port list to 3:1-3:7:

```
configure dos-protect trusted-ports ports 3:1-3:7
```

This example adds the trusted port 3:8 to the current list (use this command with a network administrator machine not connected to the internet that is attached to port 3:8):

```
configure dos-protect trusted-ports add-ports 3:8
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dos-protect type l3-protect alert-threshold

```
configure dos-protect type l3-protect alert-threshold packets
```

Description

Configures the denial of service protection alert threshold.

Syntax Description

packets	Specifies how many packets in an interval will cause an alert.

Default

The default is 4000 packets.

Usage Guidelines

This command configures how many packets received in an interval will cause a DoS protection alert. When an alert occurs, the packets are analyzed, and a temporary *ACL* is applied to the switch.

Example

This example sets the alert threshold to 8000 packets:

```
configure dos-protect type l3-protect alert-threshold 8000
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dos-protect type l3-protect notify-threshold

```
configure dos-protect type l3-protect notify-threshold packets
```

Description

Configures the denial of service protection notification threshold.

Syntax Description

packets	Specifies how many packets in an interval will cause a notification.

Default

The default is 3500 packets.

Usage Guidelines

This command configures how many packets received in an interval will cause a DoS protection notification.

Example

This example sets the notification threshold to 7500 packets:

```
configure dos-protect type l3-protect notify-threshold 7500
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure dot1p type

```
configure dot1p type dot1p_priority {qosprofile} qosprofile {ingress-
   meter [ ing_meter | none ]}
```

Description

Configures an 802.1p priority to *QoS* profile mapping for the specified ports.

Syntax Description

dot1p_priority	Specifies the 802.1p priority value. The value is an integer between 0 and 7.
qosprofile	Specifies a specific QoS profile. The value range is QP1 to QP8.
ingress-meter	Ingress rate-limiter meter.

ing_meter	Ingress rate-limiter meter name.
none	Dot1p examination rule has no ingress-meter (default if ingress-meter is unspecified).

Default

The default mapping of each 802.1p priority value to QoS profile is shown in the following table.

Table 6: Default 802.1p Priority Value-to-QoS Profile Mapping

802.1p Priority Value	ExtremeSwitching Series Switches Default QoS Profile
0	QP1
1	QP1
2	QP1
3	QP1
4	QP1
5	QP1
6	QP1
7	QP8

Usage Guidelines

An 802.1p priority value seen on ingress can be mapped to a particular QoS profile and with specific bandwidth management and priority behavior.

You must create the QoS profile first, using the `create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]` command, to map the 802.1p information to QoS profile 2 through 7.

SummitStack Only

You must create the QoS profile first, using the `create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]` command, to map the 802.1p information to QoS profile 2 through 6. You cannot create QP7 in a SummitStack.

Example

The following commands reassign (from the default) the QoS profiles associated with 802.1p priority values 1 and 2:

```
# configure dot1p type 2 qosprofile qp2
# configure dot1p type 1 qosprofile qp3
```

The following examples use the **ingress-meter** option:

```
# configure dot1p type 1 qosprofile qp5 ingress-meter ingmeter0
# configure dot1p type 2 qp3 ingress-meter ingmeter2
# configure dot1p type 3 qp4
```

History

This command was first available in ExtremeXOS 11.0.

The **ingress-meter**, *ing_meter*, and **none** options were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps add control vlan

```
configure eaps name add control {vlan} vlan_name
```

Description

Adds the specified control *VLAN* to the specified *EAPS* domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the control VLAN.

Default

N/A.

Usage Guidelines

You must configure one control VLAN for each EAPS domain. The control VLAN is used only to send and receive EAPS messages.

The control VLAN must be configured as follows:

- The VLAN must NOT be assigned an IP address, to avoid loops in the network.
- Only ring ports can be added as members of the control VLAN.
- The ring ports of the control VLAN must be tagged.

A control VLAN cannot belong to more than one EAPS domain. When the EAPS domain is active, you cannot delete or modify the configuration of the control VLAN.

By default, EAPS protocol data units (PDUs) are automatically assigned to *QoS* profile QP8. This ensures that the control VLAN messages reach their intended destinations. You do not need to configure a QoS profile for the control VLAN.

The VLAN must already exist before you can add it as a control VLAN. If you attempt to add a VLAN that does not exist, the switch displays a message similar to the following:

```
* Switch.8 # configure eaps megtest add control foo^%% Invalid input detected at '^'
marker.
```

To create the VLAN, use the `create vlan` command.

Example

The following command adds the control VLAN keys to the EAPS domain eaps_1.

```
configure eaps eaps_1 add control vlan keys
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps add protected vlan

`configure eaps` *`name`* **`add protected`** {**`vlan`**} *`vlan_name`*

Description

Adds the specified protected *VLAN* to the specified *EAPS* domain.

Syntax Description

`name`	Specifies the name of an EAPS domain.
`vlan_name`	Specifies the name of the protected VLAN.

Default

N/A.

Usage Guidelines

You must configure one or more protected VLANs for each EAPS domain. The protected VLANs are the data-carrying VLANs.

A protected VLAN can be added to one or more EAPS domains.

When you configure a protected VLAN, the ring ports of the protected VLAN must be tagged (except in the case of the default VLAN). As long as the ring is complete, the master node blocks the protected VLANs on its secondary port.

The VLAN must already exist before you can add it as a protected VLAN. If you attempt to add a VLAN that does not exist, the switch displays a message similar to the following:

```
* Switch.5 # configure eaps megtest add protected foo^%% Invalid input detected at '^'
marker.
```

To create the VLAN, use the `create vlan` command.

Example

The following command adds the protected VLAN orchid to the EAPS domain eaps_1:

```
configure eaps eaps_1 add protected vlan orchid
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps cfm

`configure eaps cfm [`**`add`**` | `**`delete`**`] `**`group`** *`group_name`*

Description

Notifies the CFM that EAPs is interested in notifications for the specified MEP and RMEP pair.

Syntax Description

`cfm`	Connectivity Fault Management.
`add`	Add a MEP group.
`delete`	Delete a MEP group.
`group` *`group_name`*	MEP group to bind.

Default

N/A.

Usage Guidelines

This command notifies CFM that EAPs is interested in notifications for this MEP and RMEP pair. This MEP should already be bound to a physical port, so when notification is received, *EAPS* associates that notification with a ring-port failure.

Example

The following command deletes the control *VLAN* keys from the EAPS domain eaps_1:

```
configure eaps cfm add
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all ExremeXOS platforms; however, not all platforms support hardware-based CFM. Platforms with no hardware-based CFM support are limited to software-based CFM transmit intervals of 100 ms or higher. Hardware-based intervals can go as low as 3.3 ms.

configure eaps config-warnings off

```
configure eaps config-warnings off
```

Description

Disables the loop protection warning messages displayed when configuring specific *EAPS* parameters.

Syntax Description

This command has no arguments or variables.

Default

By default, loop protection warnings are enabled and displayed when configuring specific EAPS parameters.

Usage Guidelines

This is a global EAPS command. You configure the warning message display on a per switch basis, not per EAPS domain.

When configuring the following EAPS parameters, the switch displays loop protection warning messages:

- Adding EAPS primary or secondary ring ports to a *VLAN*
- Deleting a protected VLAN
- Disabling the global EAPS setting on the switch
- Disabling an EAPS domain
- Configuring an EAPS domain as a transit node
- Unconfiguring EAPS primary or secondary ring ports from an EAPS domain

We recommend that you keep the loop protection warning messages enabled. If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For example, if you use a script to configure your EAPS settings, disabling the warning messages allows you to configure EAPS without replying to each interactive yes/no question.

To confirm the setting on the switch, use the following command:

```
show eaps {eapsDomain} {detail}
```

Example

The following command disables the loop protection warning messages:

```
configure eaps config-warnings off
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps config-warnings on

```
configure eaps config-warnings on
```

Description

Enables the loop protection warning messages displayed when configuring specific *EAPS* parameters.

Syntax Description

This command has no arguments or variables.

Default

By default, loop protection warnings are enabled and displayed when configuring specific EAPS parameters.

Usage Guidelines

This is a global EAPS command. You configure the warning message display on a per switch basis, not per EAPS domain.

When configuring the following EAPS parameters, the switch displays loop protection warning messages:

- Adding EAPS primary or secondary ring ports to a *VLAN*
- Deleting a protected VLAN
- Disabling the global EAPS setting on the switch
- Disabling an EAPS domain
- Configuring an EAPS domain as a transit node
- Unconfiguring EAPS primary or secondary ring ports from an EAPS domain

We recommend that you keep the loop protection warning messages enabled.

Example

The following command enables the loop protection warning messages:

```
configure eaps config-warnings on
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps delete control vlan

configure eaps *name* **delete control** {**vlan**} *vlan_name*

Description

Deletes the specified control *VLAN* from the specified *EAPS* domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the control VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes the control VLAN keys from the EAPS domain eaps_1:

```
configure eapseaps_1 delete control vlan keys
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps delete protected vlan

```
configure eaps name delete protected {vlan} vlan_name
```

Description

Deletes the specified protected *VLAN* from the specified *EAPS* domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the protected VLAN.

Default

N/A.

Usage Guidelines

To prevent loops in the network, you must delete the ring ports (the primary and the secondary ports) from the protected VLAN before deleting the protected VLAN from the EAPS domain. Failure to do so can cause a loop in the network.

The switch displays by default a warning message and prompts you to delete the VLAN from the EAPS domain. When prompted, do one of the following:

- Enter `y` delete the VLAN from the specified EAPS domain.
- Enter `n` or press **[Return]** to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the `configure eaps config-warnings off` command.

Useful show Commands

Use the following show commands to display information about your EAPS domain, including protected VLANs and primary and secondary ports:

- `show vlan`—This command displays summary information for all of the VLANs on the device. If the VLAN is a protected VLAN, the P flag appears in the flag column. To see more detailed information about the protected VLAN, use the following command: `show vlan`*`vlan_name`* .
- `show eaps`—This command displays summary EAPS domain information, including the name of the domain and the primary and secondary ports. To see more detailed information, including the name of the protected VLAN and the primary and secondary ports, use the `show eaps`*`eapsDomain`* command.

- `show vlan eaps`—This command displays whether the VLAN is a control or partner VLAN for an EAPS domain. This command also displays if the VLAN is not a member of any EAPS domain.

Example

The following example deletes the protected VLAN orchid from the EAPS domain eaps_1:

```
configure eapseaps_1delete protected vlan orchid
```

The switch displays the following warning message and prompts you to confirm this action:

```
 WARNING: Make sure EAPS ring-ports are deleted from the VLAN first. Otherwise deleting
the VLAN from the EAPS domain could cause a loop in the network! Are you sure you want to
remove the VLAN before deleting EAPS ring-ports.? (y/n)
```

Enter y to delete the VLAN from the specified EAPS domain. Enter n to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps failtime expiry-action

`configure eaps` *name* **`failtime expiry-action`** [**`open-secondary-port`** | **`send-alert`**]

Description

Configures the action taken when the failtimer expires.

Syntax Description

name	Specifies the name of an *EAPS* domain.
open-secondary-port	Specifies to open the secondary port when the failtimer expires.
send-alert	Specifies that a critical message is sent to the syslog when the failtimer expires.

Default

Default is send-alert.

Usage Guidelines

By default the action is to send an alert if the failtimer expires. Instead of going into a Failed state, the master node remains in a Complete or Init state, maintains the secondary port blocking, and writes a critical error message to syslog warning the user that there is a fault in the ring. An *SNMP* trap is also sent.

If the EAPS ring contains non-EAPS devices, you must use the open-secondary-port parameter.

Note

Use caution when setting the failtimer expiry action to open-secondary port. Using this configuration, if the master node loses three consecutive hello PDUs, the failtimer expires—but there might not be a break in the ring. Opening the secondary port in this situation creates a loop.

Example

The following command configures the failtimer expiry action for EAPS domain eaps_1:

```
configure eapseaps_1 failtimeexpiry-action open-secondary-port
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps failtime

`configure eaps` *`name`* **`failtime`** *`seconds milliseconds`*

Description

Configures the period after which the master node declares a failure if no hello PDUs are received.

Syntax Description

`name`	Specifies the name of an *EAPS* domain.
`seconds`	Specifies the number of seconds the master node waits before the failtimer expires. Default is 3 seconds, and the range is 0 to 300 seconds.
`milliseconds`	Specifies the number of milliseconds to wait before the failtimer expires. The range is 300 to 999 milliseconds.

Default

The default is 3 seconds.

Usage Guidelines

Use the failtime keyword and its associated seconds parameter to specify the amount of time the master node waits before the failtimer expires. The failtime period (seconds plus milliseconds) must be set greater than the configured value for hellotime. The default value is three seconds.

Increasing the failtime value reduces the likelihood of false failure detections caused by network congestion.

Note

You configure the action taken when the failtimer expires by using the `configure eaps failtime expiry-action` command.

In ExtremeXOS 11.0, the failtimer range was 2 to 60 seconds.

Example

The following command configures the failtimer value for the EAPS domain eaps_1 to 15 seconds:

```
configure eapseaps_1failtime15 0
```

The following command configures the failtimer value for the EAPS domain eaps_2 to 300 milliseconds:

```
configure eapseaps_2failtime0 300
```

History

This command was first available in ExtremeXOS 11.0.

The range for the failtimer was changed to 2 to 300 seconds in ExtremeXOS 11.1. The default value for the failtimer remains unchanged.

The milliseconds parameter was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps fast-convergence

```
configure eaps fast-convergence[off | on]
```

Description

Enables *EAPS* to converge more quickly.

Syntax Description

off	Turns fast-convergence off. Default is off.
on	Turns fast-convergence on.

Default

Default is off.

Usage Guidelines

This command acts on the switch, not per domain.

In certain environments to keep packet loss to a minimum when the ring is broken, configure EAPS with fast-convergence turned on. If fast convergence is turned on, you can view the configuration with the `show eaps` command.

Note

If fast-convergence is turned on, the link filters on all EAPS ring ports are turned off. This can result problems if the port's hardware encountered a problem and started "flapping" between link-up/link-down states.

Example

The following command configures fast convergence for all of the EAPS domains on the switch:

```
configure eapsfast-convergence on
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps hello-pdu-egress

`configure eaps` *name* **hello-pdu-egress** [**primary-port** | **secondary-port**]

Description

Configures the port through which a master node sends *EAPS* hello PDUs.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Default is the primary port.

Usage Guidelines

This command is provided for special network topologies that use spatial reuse and require that all EAPS hello PDUs travel in the same direction on the ring.

Note

We recommend the default (primary-port) configuration for this command.

Example

The following command configures the master switch to send EAPS hello packets from the secondary port:

```
configure eaps "domain12" hello-pdu-egress secondary-port
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps hellotime

`configure eaps` *`name`* **`hellotime`** *`seconds milliseconds`*

Description

Configures the period at which the master node sends *EAPS* hello PDUs to verify ring connectivity.

Syntax Description

`name`	Specifies the name of an EAPS domain.
`seconds`	Specifies the number of seconds to wait between transmission of hello PDUs on the control *VLAN*. The range is 0 to 15 seconds.
`milliseconds`	Specifies the number of milliseconds to wait between transmission of hello PDUs on the control VLAN. The range is 0 to 999 milliseconds.

Default

Default is 1 second.

Usage Guidelines

Use the hellotime keyword and its associated parameters to specify the amount of time the master node waits between transmissions of hello PDUs on the control VLAN. Increasing the hellotime value results in a reduced load on the processor and less traffic on the EAPS ring.

Note

The hello PDU timer value must be smaller than the fail timer value to prevent false failure detection. If you change the hello PDU timer, verify that the fail timer value remains larger.

This command applies only to the master node. If you configure the hello PDU timer for a transit node, the timer value is ignored. If you later reconfigure that transit node as the master node, the master node uses the configured hello PDU timer value.

In ExtremeXOS 11.0, the range is 1 to 15 seconds. If you are running ExtremeXOS 11.0 with the hello timer value greater than 15 seconds and you upgrade to ExtremeXOS 11.1 or later, you must modify the hello timer to be within the 1 to 15 seconds range.

Example

The following example configures the hellotime value for the EAPS domain eaps_1 to 300 milliseconds:

```
configure eap seaps_1 hellotime 0 300
```

History

This command was first available in ExtremeXOS 11.0.

The range for the hello timer was changed to 1 to 15 seconds in ExtremeXOS 11.1. The default value for the hello timer remains unchanged.

Support for a specific number of milliseconds was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps mode

```
configure eaps name mode [master | transit]
```

Description

Configures the switch as either the *EAPS* master node or as an EAPS transit node for the specified domain.

Syntax Description

name	Specifies the name of an EAPS domain.
master	Specifies that this switch should be the master node for the named EAPS domain.
transit	Specifies that this switch should be the transit node for the named EAPS domain.

Default

N/A.

Usage Guidelines

One node (or switch) on the ring must be configured as the master node for the specified domain; all other nodes (or switches) on the ring are configured as transit nodes for the same domain.

If you configure a switch to be a transit node for an EAPS domain, the switch displays by default messages to:

- Remind you to configure a master node in the EAPS domain.
- Notify you that changing a master node to a transit node might cause a loop in the network. If you have not assigned a new master node before changing the current master node to a transit node, you might cause a loop in the network.

When prompted, do one of the following:

- Enter `y` to identify the switch as a transit node.
- Enter `n` or press **[Return]** to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the `configure eaps config-warnings off` command.

Example

The following example identifies this switch as the master node for the domain named eaps_1:

```
configure eaps eaps_1 mode master
```

The following example identifies this switch as a transit node for the domain named eaps_1:

```
configure eaps eaps_1 mode transit
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Make sure this specific EAPS domain has a Master node in the ring. If you change
this node from EAPS master to EAPS transit, you could cause a loop in the network. Are you
sure you want to change mode to transit? (y/n)
```

Enter `y` to identify the switch as a transit node. Enter `n` to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps multicast add-ring-ports

```
configure eaps multicast add-ring-ports [on | off]
```

Description

Configures the switch to add previously blocked ring ports to existing multicast groups when an *EAPS* topology change occurs.

Syntax Description

on	Enables the multicast add-ring-ports feature.
off	Disables the multicast add-ring-ports feature.

Default

Off.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, multicast traffic is fastpath forwarded using the switch hardware during the topology transition. The on setting improves multicast forwarding performance during the transition.

Note

EAPS multicast flooding must be enabled before this feature will operate. For information on enabling EAPS multicast flooding, see the `configure eaps multicast temporary-flooding` command description.

When this feature is set to off and an EAPS topology change occurs, multicast traffic is slowpath forwarded using the CPU during the topology transition. The off setting reduces multicast forwarding performance during the transition.

For other methods of supporting multicast traffic during an EAPS topology change, see the descriptions for the following commands:

- `configure eaps multicast send-igmp-query`
- `configure eaps multicast temporary-flooding`

Example

The following example enables the add-ring-ports feature:

```
configure eaps multicast add-ring-ports on
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps multicast send-igmp-query

```
configure eaps multicast send-igmp-query [on | off]
```

Description

Configures the switch to send *IGMP* query messages to all protected *VLAN*s when an *EAPS* topology change occurs.

Syntax Description

on	Enables the multicast send-igmp-query feature.
off	Disables the multicast send-igmp-query feature.

Default

On.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, the switch sends IGMP query messages to all protected VLANs. If the protected VLANs in the node detecting (and generating) the topology change do not have IP address, a query is generated with the source IP address set to the querier address in that VLAN.

In a EAPS ring with many protected VLANs, the many responses can impact switch performance. This is the default behavior and was the only method for supporting multicast traffic during EAPS topology changes prior to release 12.1.2.

When this feature is set to off and an EAPS topology change occurs, the switch does not automatically send IGMP queries to all protected VLANS during the topology transition. The off setting improves switch performance during the transition, but you should use one of the following commands to see that multicast traffic is supported during and after the topology change:

- `configure eaps multicast add-ring-ports`

- `configure eaps multicast temporary-flooding`

Example

The following command disables the send-igmp-query feature:

```
configure eaps multicast send-igmp-query off
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps multicast temporary-flooding duration

`configure eaps multicast temporary-flooding duration` *`seconds`*

Description

Configures the duration for which the switch temporarily enables multicast flooding when an *EAPS* topology change occurs.

Syntax Description

seconds	Specifies the period (in seconds) for which the switch enables multicast flooding.

Default

15 seconds.

Usage Guidelines

The flooding duration configuration applies only when the temporary-flooding feature is enabled with the following command:

`configure eaps multicast temporary-flooding`

Example

The following command configures the temporary-flooding feature duration for 30 seconds:

```
configure eaps multicast temporary-flooding duration 30
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps multicast temporary-flooding

```
configure eaps multicast temporary-flooding [on | off]
```

Description

Configures the switch to temporarily enable multicast flooding when an *EAPS* topology change occurs.

Syntax Description

on	Enables the multicast temporary-flooding feature.
off	Disables the multicast temporary-flooding feature.

Default

Off.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, the switch temporarily enables multicast flooding to all protected *VLAN*s for the duration specified by the following command:

```
configure eaps multicast temporary-flooding duration
```

If you change the configuration to off, topology changes that occur after this command do not result in temporary flooding. For example, if you change the configuration to off while flooding is in progress for a protected VLAN or set of protected VLANs (due to an EAPS topology change), the flooding continues for the configured duration period. New topology changes on the protected VLANs do not cause flooding.

When this feature is set to off and an EAPS topology change occurs, the switch does not enable flooding to all protected VLANS during the topology transition. The default switch response for multicast traffic during an EAPS topology change is that defined by the following command:

```
configure eaps multicast send-igmp-query
```

You can also use the following command to configure the switch response for multicast traffic during an EAPS topology change:

```
configure eaps multicast add-ring-ports
```

Example

The following command enables the temporary-flooding feature:

```
configure eaps multicast temporary-flooding on
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps name

```
configure eaps old_name name new_name
```

Description

Renames an existing *EAPS* domain.

Syntax Description

old_name	Specifies the current name of an EAPS domain.
new_name	Specifies a new name for the EAPS domain.

Default

N/A.

Usage Guidelines

If you use the same name across categories (for example, *STPD* and EAPS names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system might return an error message.

Example

The following command renames EAPS domain eaps-1 to eaps-5:

```
configure eaps eaps-1 name eaps-5
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps port

```
configure eaps name [primary | secondary] port ports
```

Description

Configures a node port as the primary or secondary port for the specified *EAPS* domain.

Syntax Description

name	Specifies the name of an EAPS domain.
primary	Specifies that the port is to be configured as the primary port.
secondary	Specifies that the port is to be configured as the secondary port.
ports	Specifies one port or slot and port.

Default

N/A.

Usage Guidelines

Each node on the ring connects through two ring ports. One port must be configured as the primary port; the other must be configured as the secondary port.

The primary and secondary ports have significance only on a master node. The health-check messages are sent out the primary port of the master node, and the master node blocks the protected *VLAN*s on the secondary port.

The master node's secondary EAPS port cannot be configured on ports that are already configured as follows:

- Shared-port
- ISC port

There is no distinction between the primary and secondary ports on a transit node.

Beginning with ExtremeXOS 11.1, if you have a primary or secondary port that is a member of a load-shared group, you do not need to disable your EAPS domain and remove that ring port when modifying the load-shared group. For more information about configuring load sharing on your switch, see "Configuring Slots and Ports on a Switch" in the *Switch Engine 32.2 User Guide*.

For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

Messages Displayed when Adding EAPS Ring Ports to a VLAN

If you attempt to add EAPS ring ports to a VLAN that is not protected by EAPS, the switch prompts you by default to confirm this action. For example, if you use the `configure vlan vlan_name add ports port_list` command, and the ports that you are attempting to add to the VLAN are currently used by EAPS as either primary or secondary ring ports, the switch displays the following message:

```
 Make sure <vlan_name> is protected by EAPS. Adding EAPS ring ports to a VLAN could cause
a loop in the network. Do you really want to add these ports (y/n)
```

Enter y to add the ports to the VLAN. Enter n or press [Return] to cancel this action.

If you see this message, either configure the VLAN as an EAPS protected VLAN by using the `configure eaps add protected vlan` command or add ports that the EAPS domain does not use as primary or secondary ring ports.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the `configure eaps config-warnings off`.

Example

The following example adds port 1 to the EAPS domain eaps_1 as the primary port:

```
configure eapseaps_1primary port 1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps priority

`configure eaps` *name* **priority** {**high** | **normal**}

Description

Configures an *EAPS* domain priority.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Normal.

Usage Guidelines

Extreme Networks recommends that no more than 200 protected VLANs be configured as high priority domains. Priority protection works best when the majority of protected VLANs are configured for normal priority and a relatively small percentage of the protected VLANs are configured as high priority domains.

When EAPS domains on two separate physical rings share a common link (shared-port configuration) and have one or more protected VLANs in common, the domains must be configured with the same domain priority.

When EAPS domain priority is configured on separate physical rings that are connected to the same switch, the priorities on each ring are serviced independently. For example, if there is a break on both Ring A and Ring B, the high priority domains on each ring are serviced before the lower priority domains. However, the switch does not attempt to process the high priority domains on Ring B before servicing the normal priority domains on Ring A.

For a high priority domain to get priority over normal priority domains, all switches in the EAPS domain must support high priority domains. If high priority domains are configured on a switch that is in a ring with one or more switches that do not support high priority domains (software releases before ExtremeXOS Release 12.5), the high priority domain operates as a normal priority domain.

Example

The following command configures the eaps_1 domain as a high priority domain:

```
configure eapseaps_1 priority high
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure eaps shared-port common-path-timers

```
configure eaps shared-port port common-path-timers {[health-interval |
   timeout] seconds}
```

Description

Configures the common path health interval or timeout value.

Syntax Description

port	Specifies the port number of the common link port.
health-interval	Specifies the interval for health check messages on the common link.

timeout	Specifies the timeout value for the common link.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the common path health interval, in seconds, for a given port. The range is from 1 to 10 seconds.

Example

The following command configures a common-link health interval of 5 seconds on port 1:1.

```
configure eaps shared-port 1:1 common-path-timers health-interval 5
```

The following command configures a segment timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 common-path-timers timeout 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure eaps shared-port link-id

`configure eaps shared-port` *ports* **link-id** *id*

Description

Configures the link ID of the shared port.

Syntax Description

ports	Specifies the port number of the common link port.
id	Specifies the link ID of the port. The link ID range is 1 to 65535.

Default

N/A.

Usage Guidelines

Each common link in the *EAPS* network must have a unique link ID. The controller and partner shared ports belonging to the same common link must have matching link IDs. No other instance in the network should have that link ID.

If you have multiple adjacent common links, we recommend that you configure the link IDs in ascending order of adjacency. For example, if you have an EAPS configuration with three adjacent common links, moving from left to right of the topology, configure the link IDs from the lowest to the highest value.

Example

The following command configures the EAPS shared port 1:1 to have a link ID of 1.

```
configure eaps shared-port 1:1 link-id 1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure eaps shared-port mode

`configure eaps shared-port` *`ports`* **`mode`** *`controller`* | *`partner`*

Description

Configures the mode of the shared port.

Syntax Description

`ports`	Specifies the port number of the shared port.
`controller`	Specifies the controller mode. The controller is the end of the common link responsible for blocking ports when the common link fails thereby preventing the superloop.
`partner`	Specifies partner mode. The partner is responsible only for sending and receiving health-check messages.

Default

N/A.

Usage Guidelines

The shared port on one end of the common link must be configured to be the controller. This is the end responsible for blocking ports when the common link fails thereby preventing the superloop.

The shared port on the other end of the common link must be configured to be the partner. This end does not participate in any form of blocking. It is responsible only for sending and receiving health-check messages.

Example

The following command configures the shared port 1:1 to be the controller.

```
configure eaps shared-port 1:1 mode controller
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure eaps shared-port segment-timers expiry-action

```
configure eaps shared-port port segment-timers expiry-action [segment-
   down | send-alert]
```

Description

Configures the action taken when the segment timeout timer expires.

Syntax Description

port	Specifies the port number of the common link port.
segment-down	Marks the segment as DOWN if the segment timer expires. No link-status-query is sent to verify that links are down.
send-alert	If the segment timer expires, the switch keeps segments up, but sends a warning message to the log. The segment fail flag is set, an *SNMP* trap is sent, and a link-status-query is sent to verify if any links are down.

Default

Default is send-alert.

Usage Guidelines

By default, the action is to send an alert if the segment timeout timer expires. Instead of the segment going into a failed state and being marked as down, the segment remains in a segment up state with the failed flag set. The switch writes a critical error message to the syslog warning the user that there is a fault in the segment. An SNMP trap is also sent.

Note

Use caution when setting the segment-timeout expiry action to segment-down. Using this configuration, if the controller or partner node loses three consecutive hello PDUs, the failtimer expires—but there might not be a break in the segment. Opening a blocked port in this situation creates a loop.

The following describes some general recommendations for using this command:

- When you configure your Extreme Networks switches as the partner and controller, respectively, make sure that their segment timer configurations are identical.

  For example, if you have a partner switch with the segment-timeout expiry action set to send-alert, make sure the controller switch has its segment-timeout expiry action set to send-alert.

  However, if you have a partner switch with the segment-timeout expiry action set to send-alert, and the controller switch does not have a segment timer configuration, you must configure the partner switch's segment-timeout expiry action to segment-down.
- If you have a network containing non-Extreme Networks switches or non-*EAPS* devices, set the segment-timeout expiry action to segment-down.

The following events can cause a ring segment failure:

- There is a hardware failure.
- The controller or partner received a Link Down message from the partner or controller, respectively.
- The segment timer expires and the expiry action was set to segment-down. This means that either the controller or partner did not receive health check messages during the defined segment timeout period.

To view shared-port information, including shared-port segment status, use the following command:

```
show eaps shared-port {port}{detail}
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure eaps shared-port segment-timers health-interval

```
configure eaps shared-port port segment-timers health-interval seconds
```

Description

Configures the shared-port health interval timeout.

Syntax Description

port	Specifies the port number of the common link port.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the shared-port health interval timeout, in seconds, for a given port.

Example

The following command configures a shared-port health interval timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 segment-timers health-interval 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure eaps shared-port segment-timers timeout

```
configure eaps shared-port port segment-timers timeout seconds
```

Description

Configures the shared-port timeout.

Syntax Description

port	Specifies the port number of the common link port.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the shared-port timeout, in seconds, for a given port.

Example

The following command configures a shared-port timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 segment-timers timeout 10
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure edp advertisement-interval

`configure edp` **`advertisment-interval`** *`timer`* **`holddown-interval`** *`timeout`*

Description

Sets the advertisement interval and hold down interval for *EDP*.

Syntax Description

timer	Specifies the advertisement interval in seconds.
timeout	Specifies the hold down interval in seconds.

Default

The default setting for timer is 60 seconds, and for timeout is 180 seconds.

Usage Guidelines

Extreme Discover Protocol (EDP) is used to gather information about neighbor Extreme Networks switches. EDP-enabled ports advertise information about the Extreme switch to other switches on the interface and receive advertisements from other Extreme switches. Information about other Extreme switches is discarded after the hold down interval timeout value is reached without receiving another advertisement.

Example

The following command configures the EDP advertisement-interval to 2 minutes and the hold down interval to 6 minutes:

```
configure edp advertisement-interval 120 holddown-interval 360
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client dynamic-vlans

```
configure elrp-client dynamic-vlans {mvrp | netlogin | vm-tracking |
   policy | fabric-attach | all} [on | off]
```

Description

This command enables/disables Extreme Loop Recognition Protocol (ELRP) over various types of dynamic *VLAN*s.

Syntax Description

dynamic-vlans	ELRP configuration options for dynamically created VLANs.
mvrp	Specifies that the command applies to dynamic VLANs created by Multiple VLAN Registration Protocol (MVRP) only.
netlogin	Specifies that the command applies to dynamic VLANs created by Network Login only.
vm-tracking	Specifies that the command applies to dynamic VLANs created by virtual machine MAC tracking only.

policy	Specifies that the command applies to dynamic VLANs created by One Policy.
fabric-attach	Specifies that the command applies to dynamic VLANs created by Fabric Attach.
all	(Default) Specifies that the command applies to all types of dynamic VLANs.
on	Enable ELRP for dynamic VLANs.
off	Disables ELRP for dynamic VLANs.

Default

ELRP for dynamic VLANs is "off" by default. If the type of dynamic VLAN is not specified, the command applies to all types of dynamic VLANs.

Example

The following example enables ELRP for all types of dynamic VLANs:

```
configure elrp-client dynamic-vlans on
```

The following example disables ELRP for VM tracking dynamic VLANs:

```
configure elrp-client dynamic-vlans vm-tracking off
```

The following example enables ELRP for Netlogin dynamic VLANs:

```
configure elrp-client dynamic-vlans netlogin on
```

The following example enables ELRP for One Policy dynamic VLANs:

```
configure elrp-client dynamic-vlans policy on
```

The following example disables ELRP for One Policy dynamic VLANs:

```
configure elrp-client dynamic-vlans policy off
```

History

This command was first available in ExtremeXOS 22.2.

The **policy** and **fabric-attach keywords** were added in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client dynamic-vlans action

```
configure elrp-client dynamic-vlans {mvrp | netlogin | vm-tracking |
   policy | fabric-attach | all} [{interval sec} {action [{log | trap |
```

log-and-trap} {**disable-port** {[{**egress** | **ingress**} {**duration** *seconds* | **permanent**}] | **none**}}]}]

Description

This command sets actions to be taken after Extreme Loop Recognition Protocol (ELRP) on dynamic *VLAN*s detects a loop.

Syntax Description

dynamic-vlans	ELRP configuration options for dynamically created VLANs.
mvrp	Specifies that the command applies to dynamic VLANs created by Multiple VLAN Registration Protocol (MVRP) only.
netlogin	Specifies that the command applies to dynamic VLANs created by Network Login only.
vm-tracking	Specifies that the command applies to dynamic VLANs created by virtual machine MAC tracking only.
policy	Specifies that the command applies to dynamic VLANs created by One Policy.
fabric-attach	Specifies that the command applies to dynamic VLANs created by Fabric Attach.
all	(Default) Specifies that the command applies to all types of dynamic VLANs.
interval	Specifies setting the time interval between successive ELRP polls.
sec	Sets the time interval in seconds between successive ELRP polls. Range is 1–600. Default = 1.
action	Action to be taken after ELRP poll result.
log	Print ELRP poll result to system log.
trap	Send SNMP trap.
log-and-trap	Print ELRP poll result to system log and send SNMP trap.
disable-port	Disable port where looped PDU was transmitted or received.
egress	Disable port where looped PDU was transmitted.
ingress	Disable port where looped PDU was received (default).
duration	Specifies setting the time period that the port is kept disabled before re-enabling.
seconds	Sets the time in seconds that the port is kept disabled before re-enabling. Range is 15–600. Default = 30.
permanent	Keep port disabled permanently. You must intervene to re-enable.
none	Removes any previously set actions.

Default

If the type of dynamic VLAN is not specified, the command applies to all types of dynamic VLANs.

If the time duration is not set for the period between ELRP polls, the default is one second.

If not specified, the port that the looped PDU was received on is disabled.

If not specified, the disabled port is kept disabled for 30 seconds before it is re-enabled.

Example

The following example enables ELRP for all types of dynamic VLANs with a time interval between ELRP polls of 2 seconds:

```
configure elrp-client dynamic-vlans interval 2
```

The following example enables ELRP for MVRP VLANs with SNMP trap set when a loop is detected:

```
configure elrp-client dynamic-vlans mvrp action trap
```

The following example enables ELRP for all types of dynamic VLANs and disables the egress port where the loop is detected permanently:

```
configure elrp-client dynamic-vlans action disable-port egress permanent
```

The following example enables ELRP for VM-tracking VLANs and disables the ingress port where the loop is detected for 100 seconds:

```
configure elrp-client dynamic-vlans vm-tracking action disable-port ingress duration 100
```

The following example enables ELRP for Fabric Attach VLANs and disables the ingress port where the loop is detected for 100 seconds:

```
configure elrp-client dynamic-vlans fabric-attach action disable-port ingress duration 100
```

History

This command was first available in ExtremeXOS 22.3.

The **policy** and **fabric-attach keywords** were added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client dynamic-vlans client/uplink ports/remote-endpoints vxlan

```
configure elrp-client dynamic-vlans [netlogin | vm-tracking] [client-
   ports | uplink-ports | remote-endpoints vxlan] [on | off]
```

Description

This command turns Extreme Loop Recognition Protocol (ELRP) on/off for client ports or uplink ports for dynamic VLANs.

Syntax Description

netlogin	Specifies that the command applies to dynamic VLANs created by Network Login only.
vm-tracking	Specifies that the command applies to dynamic VLANs created by virtual machine MAC tracking only.
client-ports	Specifies client ports only.
uplink-ports	Specifies uplink ports only.
remote-endpoints	Specifies remote endpoints that are part of this VLAN.
vxlan	Specifies VXLAN remote endpoints that are part of this VLAN.
on	Enable ELRP for dynamic VLANs.
off	Disables ELRP for dynamic VLANs.

Default

ELRP for dynamic VLANs is "off" by default.

Example

The following example enables ELRP for Netlogin dynamic VLANs on uplink ports only:

```
configure elrp-client dynamic-vlans netlogin uplink-ports on
```

The following example enables ELRP for XNV dynamic VLANs on VXLAN remote endpoints that belong to the VLAN:

```
configure elrp-client dynamic-vlans vm-tracking remote-endpoints vxlan on
```

History

This command was first available in ExtremeXOS 22.2.

Remote endpoint capability was added in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client disable ports

```
configure elrp-client disable-ports [exclude | include] [ ports | eaps-
   ring-ports | remote-endpoints vxlan | inter-vlan-loop]
```

Description

Creates an ELRP exclude port list.

Syntax Description

exclude	Specifies that selected ports are to be excluded from ELRP disabling.
include	Specifies that selected ports are to be included in ELRP disabling.
ports	Specifies one or more ports to be excluded or included.
eaps-ring-ports	Specifies whether *EAPS* ring ports are to be excluded or included.
remote-endpoints	Specifies remote endpoints, if any, that are part of this VLAN.
vxlan	Specifies VXLAN remote endpoints that are part of this VLAN.
inter-vlan-loop	Excludes inter-VLAN loop detected ports.

Default

All ports, together with EAPS ring ports and VXLAN remote endpoints, are included by default; that is, they are disabled if a loop is detected on that port.

Usage Guidelines

Use this command to specify ports, EAPS ring ports, or VXLAN remote endpoints that are to be part of an ELRP exclude port list. Use the exclude option to add ports to the exclude port list. Use the include option to remove them from the list.

When ELRP detects a loop and has been configured to automatically disable the port where a looped ELRP PDU is received and an exclude port list has been configured, it will check to determine if that port is on the exclude port list. If that port is on the list, ELRP will not disable it; if it is not on the list, it will be disabled.

To display the ports that are include in the exclude port list, use the `show elrp disabled-ports` command.

To remove the exclude port list, use the `unconfigure elrp-client disable ports` command.

Example

The following example adds port 2:1 to an ELRP exclude port list:

```
configure elrp-client disable-ports exclude 2:1,2:3
```

History

This command was first available in ExtremeXOS 12.5.3.

VXLAN remote endpoint option added in ExtremeXOS 22.4.

The **inter-vlan-loop** option for excluding inter-VLAN loop detected ports was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client hardware-assist

```
configure elrp-client hardware-assist loopback-port [port | none]
```

Description

Configures or unconfigures a front panel port as the designated loopback port for hardware-assisted *ELRP (Extreme Loop Recovery Protocol)*.

Syntax Description

elrp-client	Configures ELRP client.
hardware-assist	Selects configuring hardware-assisted ELRP.
loopback-port	Designates selecting a loopback port for hardware-assisted ELRP.
port	Selects the loopback port. The port must be an unused front panel port.
none	Unconfigures a loopback port.

Default

N/A.

Usage Guidelines

The loopback port must be an unused front panel port. The selected loopback port cannot be part of a VLAN. The loopback port cannot be changed or unconfigured if hardware-assisted ELRP mode is enabled. To disable hardware-assisted ELRP, use the command `disable elrp-client` .

Example

The following example configures port 7 as the loopback port for hardware-assisted ELRP:

```
# configure elrp-client hardware-assist loopback-port 7
```

The following example unconfigures the loopback port for hardware-assisted ELRP:

```
# configure elrp-client hardware-assist loopback-port none
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client inter-vlan-loop-detection

```
configure elrp-client inter-vlan-loop-detection [on | off]
```

Description

Turns on/off Extreme Loop Recovery Protocol (ELRP) inter-VLAN loop detection.

Syntax Description

inter-vlan-loop-detection	ELRP detects loops between untagged ports on different VLANs on the same switch.
on	Turns on Inter-VLAN loop detection. (Default)
off	Turns off Inter-VLAN loop detection.

Default

Inter-VLAN loop detection is on by default.

Usage Guidelines

It is common in networks for you to accidentally inter-connect two different VLANs by looping together two untagged ports (one in each respective VLAN). This type of configuration results in an outage, and it is difficult for the average user to detect.

If desired, you can then include or exclude the inter-VLAN loops to be disabled using the `configure elrp-client` **disable-ports** [**exclude** | **include**] [*ports* | **eaps-ring-ports** | **remote-endpoints vxlan** | **inter-vlan-loop**] command.

Example

The following example turns on Inter-VLAN loop detection:

```
# configure elrp-client inter-vlan-loop-detection on
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client one-shot

```
configure elrp-client one-shot {vlan [vlan_name | all} ports [ports |
   all |none] {remote-endpoints vxlan all} {interval interval {seconds |
   milliseconds}} {retry count} {log | print | print-and-log]}
```

Description

Starts one-time, non-periodic ELRP packet transmission on the specified ports of the *VLAN* using the specified count and interval.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
ports	Specifies the set of VLAN ports for packet transmission.
remote-endpoints	Specifies remote endpoints that are part of this VLAN.
vxlan	Specifies VXLAN remote endpoints that are part of this VLAN.
interval	Time interval between two successive ELRP PDUs.
interval	Interval value between 1–64 seconds or 100–64,000 milliseconds. Default is 1 second.
seconds	Specifies that time interval is in the unit of seconds.
milliseconds	Specifies that time interval is in the unit of milliseconds.
all	Specifies all ports of this VLAN for packet transmission.
count	Specifies the number of times ELRP packets must be transmitted. The range is 1 to 255 times. The default is 3 times.
log	Specifies that a message should be logged in the system log file when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
print	Specifies that a message should be printed to the console when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
print-and-log	Specifies that a message should be logged in the system log file and printed to the console when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.

Default

Second—The interval between consecutive packet transmissions is 1 second.

Count—The number of time ELRP packets must be transmitted is 10.

Usage Guidelines

This command starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval. If any of these transmitted packets is returned, indicating loopback detection, the ELRP client can perform a configured action such as logging a message in the system log file or printing a log message to the console. There is no need to send a trap to the *SNMP* manager for non-periodic requests.

Note

You can also use the command run elrp on page 2419 to perform one-time ELRP packet transmission.

Use the `configure elrp-client periodic` command to configure periodic transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the `enable elrp-client` command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the `disable elrp-client` command to globally disable the ELRP client.

Example

The following example starts one-time, non-periodic ELRP packet transmission on all ports of the VLAN sales, uses the default interval and transmission times, and sends messages to the console:

```
configure elrp-client one-shot sales ports all interval 1 seconds retry 3 print
```

History

This command was first available in ExtremeXOS 11.1.

The ability to specify the time interval in milliseconds was introduced in ExtremeXOS 22.4.

VXLAN remote endpoint option added in ExtremeXOS 22.4.

The **all** option for VLANs was added in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elrp-client periodic

```
configure elrp-client periodic {vlan} vlan_name ports [ports | all |
   none] {remote-endpoints vxlan all} {interval interval {seconds |
   milliseconds}} {log | log-and-trap | trap} {disable-port {egress |
   ingress} {duration {seconds} | permanent}}
```

Description

Starts periodic ELRP packet transmission on the specified ports of the *VLAN* or *VXLAN* remote tunnel endpoints (RTEPs) using the specified interval.

Syntax Description

vlan	Specifies a VLAN name.
vlan_name	Specifies a VLAN name.
ports	Specifies the set of VLAN ports for packet transmission.
all	Specifies all ports for packet transmission.
none	Specifies no ports for packet transmission. This option allows you to configure (unambiguously) ELRP on only VXLAN RTEPs.
remote-endpoints	Specifies to include the remote endpoints, if any, in this VLAN. Only supported with software ELRP.
vxlan	Specifies VXLAN remote endpoints.
interval	Time interval between two successive ELRP PDUs.
interval	Software ELRP interval range between 1–600 seconds or 1,000–600,000 ms. Hardware-assisted ELRP interval range is between 3–600,000 ms. Default is 1 second.
seconds	Specifies that time interval is in the unit of seconds.
milliseconds	Specifies that time interval is in the unit of milliseconds.
log	Specifies that a message should be logged in the system log file when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
log-and-trap	(Default) Specifies that a message should be logged in the system log file and trap message should be sent to the *SNMP* manager when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
trap	Specifies that a trap message should be sent to the SNMP manager when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
disable-port	Specifies that the port should be disabled where the looped PDU is received.
egress	Disable port where looped PDU was transmitted. Only supported with software ELRP.
duration	Specifies a hold time that the port is kept disabled before re-enabling.
seconds	The number of seconds the port is kept disabled.
permanent	Specifies that the port is disabled permanently. User intervention is required to enable.

Default

The default interval between consecutive packet transmissions is 1 second.

If a duration in seconds is not specified, the default is permanent.

If not specified, log-and-trap action is the default.

Usage Guidelines

This command starts periodic ELRP packet transmission on the specified ports of the VLAN using the specified interval. If any of these transmitted packets is returned, indicating loopback detection, the ELRP client performs a configured action of logging a message in the system log file and/or sending a trap to the SNMP manager.

Beginning with ExtremeXOS 12.4, you have the option to automatically disable the port where the looped packet arrives and to specify the time interval for which the port remains disabled. When that specified time expires, the port is automatically enabled.

Should a loop occur on multiple ports, only the first port in the VLAN on which the PDU is received is disabled. The second port is ignored for 1 or 2 seconds and then if another PDU is received, that port is disabled until the loop is gone. This prevents shutting down all ports in the VLAN.

Use either the `configure elrp-client one-shot` or the `run elrp` command to configure non-periodic, one-time transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the `enable elrp-client` command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the `disable elrp-client` command to globally disable the ELRP client.

Use the `show elrp` command to check the ELRP status and the `show elrp disabled-ports` command to view details of ELRP disabled ports.

For the **`interval`** option with hardware-assisted ELRP, hardware-assisted ELRP uses ACL meter to rate limit the PDU TX rate, which has a granularity of 8 Kbps, so for any interval configured for longer than 70ms in hardware-assisted ELRP mode, the actual interval is around 70ms. This is determined by hardware capabilities of the switch.

Example

The following example starts periodic ELRP packet transmission on slot 3, port 2 of VLAN marketing, sends packet transmissions every 2 seconds, sends messages to the log, and should a loop be detected, disables the port for 5 seconds:

```
configure elrp-client periodic marketing ports 3:2 interval 2 seconds log disable-port
duration 5
```

History

This command was first available in ExtremeXOS 11.1.

The disable port feature was added in ExtremeXOS 12.4.

The ability to specify the time interval in milliseconds was introduced in ExtremeXOS 22.4.

The ability to specify VXLAN RTEPs was introduced in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elsm ports hellotime

```
configure elsm ports port_list hellotime hello_time
```

Description

Configures the ELSM hello timer by specifying the time between consecutive hello messages for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which the ELSM hello timer should be configured.
hello_time	Specifies the time in seconds between consecutive hello messages. Use the same value for the hello interval on peer ports. The default value is 1 second, and the range is 1 to 128 seconds.

Default

The default is 1 second.

Usage Guidelines

ELSM works between two connected ports, and each ELSM instance is based on a single port.

When you enable ELSM on the specified ports, the ports participate in ELSM with their peers and begin exchanging ELSM hello messages.

ELSM uses two types of hello messages to communicate the health of the network to other ELSM ports:

- Hello+ — The ELSM-enabled port receives a hello message from its peer and no problem is detected.
- Hello- — The ELSM-enabled port does not receive a hello message from its peer.

ELSM also has hello transmit states. The hello transmit states display the current state of transmitted ELSM hello messages. For more information about the hello transmit states, see the `show elsm ports` command.

A high hello timer value can increase the time it takes for the ELSM-enabled port to enter the Up state. The down timer is (2 + hold threshold) * hello timer. Assuming the default value of 2 for the hold threshold, configuring a hello timer of 128 seconds creates a down timer of (2 + 2) 128, or 512 seconds. In this scenario it would take 512 seconds for the port to transition from the Down to the Up state.

If you modify the hello timer on one port, we recommend that you use the same hello timer value on its peer port.

Example

The following command specifies 5 seconds between consecutive ELSM hello messages for slot 2, ports 1-2 on the switch:

```
configure elsm ports 2:1-2:2 hellotime 5
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elsm ports hold-threshold

`configure elsm ports` *`port_list`* **`hold-threshold`** *`hold_threshold`*

Description

Configures the number of Hello+ messages required by the specified ELSM-enabled ports to transition from the Down-Wait state to the Up state.

Syntax Description

`port_list`	Specifies the port or ports for which the ELSM hold threshold should be configured.
`hold_threshold`	Specifies the number of Hello+ messages required to transition from the Down-Wait state to the Up state. The default is 2 messages, and the range is 1 to 40 messages.

Default

The default is 2 Hello+ messages.

Usage Guidelines

The port begins in the Down state, so the first received Hello+ message transitions the ELSM-enabled port from the Down state to the Down-Wait state. After that transition, the configured hold-threshold value determines the number of Hello+ messages required to transition from Down-Wait state to the Up state.

The ELSM hold threshold determines the number of Hello+ messages the ELSM peer port must receive to transition from the Down-Wait state to the Up state. For example, a threshold of 1 means the ELSM port must receive at least one Hello+ message to transition from the Down-Wait state to the Up state.

After the down timer expires, the port checks the number of Hello+ messages against the hold threshold. If the number of Hello+ messages received is greater than or equal to the configured hold threshold, the ELSM receive port moves from the Down-Wait state to the Up state.

If the number of Hello+ messages received is less than the configured hold threshold, the ELSM receive port moves from the Down-Wait state back to the Down state and begins the process again.

If you modify the hold threshold on one port, we recommend that you use the same hold threshold value on its peer port.

You configure the hold threshold on a per-port basis, not on a per-switch basis.

Example

The following command specifies that two Hello+ messages are required for the ELSM receive ports configured on slot 2, ports 1-2, to transition from the Down-Wait state to the Up state:

```
configure elsm hold-threshold 2 ports 2:1-2:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure elsm ports uptimer-threshold

`configure elsm ports` *`port_list`* **`uptimer-threshold`** *`uptimer_threshold`*

Description

Configures the number of Hello+ messages required by the specified ELSM-enabled ports to transition from the Up state to the Down state.

Syntax Description

`port_list`	Specifies the port or ports for which the ELSM hold threshold should be configured.
`uptimer_threshold`	Specifies the number of Hello+ messages required to transition from the Up- state to the Down state. The default is 6messages, and the range is 3 to 60 messages.

Default

The default is 6 Hello+ messages.

Usage Guidelines

The ELSM up timer begins when the ELSM-enabled port enters the UP state. Each time the port receives a Hello+ message, the timer restarts. Up timer is Uptimer_threshold * hello timer. When the Up timer expires, it transits from UP state to DOWN state.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure erps add control vlan

```
configure erps ring-name add control {vlan} vlan_name
```

Description

Add a control *VLAN* on the *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
control	VLAN that carries ERPS control traffic.
vlan_name	Alphanumeric string identifying the VLAN to be used for control traffic.

Default

N/A.

Usage Guidelines

Use this command to add a control VLAN on the ERPS ring. This is the VLAN that carries ERPS control traffic.

Note

Other VLAN types such as VMAN, SVLAN, CVLAN and BVLAN will not be used for control traffic. A control VLAN cannot be deleted from a ring that has CFM configured.

Example

The following command adds a control VLAN named “vlan10” to an ERPS ring named “ring1”:

```
configure erps ring1 add control vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps add protected vlan

`configure erps` *`ring-name`* **`add protected`** {**`vlan`**} *`vlan_name`*

Description

Add a protected *VLAN* on the *ERPS* ring. This is a data VLAN that ERPS will protect.

Syntax Description

`ring-name`	Alphanumeric string that identifies the ERPS ring.
`vlan_name`	Alphanumeric string identifying the data VLAN to be added that ERPS will protect. This can be a VLAN, SVLAN, BVLAN or VMAN.

Default

N/A.

Usage Guidelines

Use this command to add a protected data VLAN on the ERPS ring. This VLAN will be protected by ERPS, and it can be a VLAN, SVLAN, BVLAN or VMAN.

Note
The SVLAN-BVLAN combination cannot both be added to the same ring or sub-ring.

Example

The following command adds a protected VLAN named “vlan10” to an ERPS ring named “ring1”:

```
configure erps ring1 add protected vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps control-mac

```
configure erps ring-name control-mac [auto | default]
```

Description

Configures *ERPS* control MAC (either default or auto) on a particular ERPS ring instance.

Syntax Description

erps	Specifies ERPS (ITU-T G.8032).
ring-name	Specifies the alphanumeric string that identifies the ERPS ring/sub-ring.
control-mac	Destination MAC used in R-APS PDUs .
auto	Use ring ID-based MAC address (01:19:A7:00:00:ring-id).
default	Use default MAC address (01:19:A7:00:00:01).

Default

By default, if an ERPS ring instance is created with a user-defined ring ID, the control MAC used by ring instance is auto (01:19:A7:00:00:ring-id).

By default, if an ERPS ring instance is created without a user-defined ring ID, the control MAC used by the ring instance is default (01:19:A7:00:00:01).

Usage Guidelines

As per the ITU G.8032 standard, destination MAC used in R-APS PDUs are of 2 types:

- 01:19:A7:00:00:01 (default)
- 01:19:A7:00:00:ringId (auto)

Note
This command is only applicable on ERPS ring instances created with user-defined ring ID.

Example

The following example configures the control MAC of an ERPS ring instance created with a user-defined ring ID:

```
# configure  erps Ring2 control-mac auto
```

The following example configures the control MAC of an ERPS ring instance created without a user-defined ring ID:

```
# configure  erps Ring1 control-mac auto
       Error: This cli is applicable only when the erps ring is created with a user
defined ringId. The default
       control-mac is used here.
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure erps cfm port group

```
configure erps ring_name cfm port [east | west] [add | delete] group
   group_name
```

Description

Associates or disassociates fault monitoring entities on the *ERPS* ring ports.

Syntax Description

ring_name	Alphanumeric string that identifies the ERPS ring.
east	East port.
west	West port.
add	Associates a CFM Down-MEP entity.
delete	Disassociates a CFM Down-MEP entity.
group	Specifies a CFM Down-MEP group.
group_name	Specifies the name of the Down MEP group.

Default

N/A.

Usage Guidelines

Use this command to associate or disassociate fault monitoring entities on the ERPS ring ports.

Example

The following command associates fault monitoring on the group "group1":

```
configure erps ring1 cfm port east add group1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms running ExtremeXOS.

configure erps cfm protection group

`configure erps` *`ring_name`* **`cfm protection`** [**`add delete`**] **`group`** *`cfm_group`*

Description

Associates or disassociates a CFM UP MEP group for subring protection across the main ring.

Syntax Description

`ring-name`	Alphanumeric string that identifies the *ERPS* ring.
`add`	Associates a CFM Up-MEP entity.
`delete`	Disassociates a CFM Up-MEP entity.
`group`	Specifies a CFM Up-MEP group.

Default

N/A.

Usage Guidelines

Use this command to associate or disassociate a CFM UP MEP group for subring protection across the main ring.

When an UP MEP is configured for protection of a subring, the Manual Switch event will be enforced on the subring port on the interconnected nodes.As per Appendix X of the standard, the MS is issued when the node type and the multiple failure type are the same. ExtremeXOS implementation currentlyconfigures the node type to be the same as the fault type. So the user will notice both the

subring ports of the two interconnected nodes to be held inMS when multiple failures on the main ring occur. When the multiple failure clears this MS is also cleared.

Example

The following command associates a CFM UP MEP group for subring protection on the group "group1":

```
configure erps ring1 cfm protection add group1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms running ExtremeXOS.

configure erps delete control vlan

`configure erps` *ring-name* **delete control** {**vlan**} *vlan_name*

Description

Delete a control *VLAN* on the *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
vlan_name	Alphanumeric string identifying the VLAN used for control traffic.

Default

N/A.

Usage Guidelines

Use this command to delete a control VLAN from the ERPS ring. This is the VLAN that carries ERPS control traffic.

Note

Other VLAN types such as VMAN, SVLAN, CVLAN and BVLAN will not be used for control traffic.

A control VLAN cannot be deleted from a ring that has CFM configured.

Example

The following command deletes a control VLAN named “vlan10” from an ERPS ring named “ring1”:

```
configure erps ring1 delete control vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps delete protected vlan

```
configure erps ring-name delete protected {vlan} vlan_name
```

Description

Delete a protected data *VLAN* from the *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
vlan_name	Alphanumeric string identifying the data VLAN to be deleted from the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to delete a protected VLAN from the ERPS ring.

Example

The following command deletes a protected VLAN named “vlan10” from an ERPS ring named “ring1”:

```
configure erps ring1 delete protected vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps dynamic-state

```
configure erps ring-name dynamic-state [force-switch | manual-switch |
   clear] port slot:port
```

Description

Configure or clear force-switch or manual-switch for the *ERPS* ring/sub-ring.

Syntax Description

dynamic-state	Configure force/manual/clear switch on the active ERPS ring.
force-switch	Force-switch operation.
manual-switch	Manual-switch operation.
clear	Clears force-switch/manual-switch.

Default

N/A.

Usage Guidelines

Use this command to configure or clear force-switch or manual-switch for the ERPS ring/sub-ring.

Note

In non-revertive mode, in the "Pending" state, you can use the **clear** option of this command to return to the "Idle" state where the blocked link is manually reverted to the Ring Protection Link (RPL).

Example

The following command clears force-switch and manual-switch on an ERPS ring named "ring1":

```
configure erps ring1 dynamic-state clear
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure erps name

```
configure erps old-ring-name name new-ring-name
```

Description

Rename the *ERPS* ring/sub-ring.

Syntax Description

old-ring-name	Alphanumeric string that identifies the ERPS ring.
new-ring-name	New alphanumeric string identifying the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to rename the ERPS ring or sub-ring.

Example

The following command an ERPS ring from “ring1” to “ring2”:

```
configure erps ring1 name ring2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps neighbor port

```
configure erps ring-name neighbor-port port
```

Description

Add RPL (ring protection link) neighbor configuration for the *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
port	The slot:port number for RPL neighbor.

Default

N/A.

Usage Guidelines

Use this command to add RPL neighbor configuration for the ERPS ring.

Note

This command implicitly makes the node on which it is configured the RPL neighbor.

Example

The following command adds RPL neighbor on port 5 to an ERPS ring named “ring1”:

```
configure erps ring1 neighbor-port 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps notify-topology-change

configure {**erps**} *ring-name* **notify-topology-change** {**eaps**} *domain_name*

Description

Add an *ERPS* sub-ring to the *EAPS* domain.

Syntax Description

ring-name	Alphanumeric string identififying the ERPS sub-ring.
domain_name	Alphanumeric string identifying the EAPS domain.

Default

N/A.

Usage Guidelines

Use this command to add an ERPS sub-ring to the EAPS domain.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps protection-port

```
configure erps ring-name protection-port port
```

Description

Add ring protection link (RPL) owner configuration for the *ERPS* ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
port	The slot:port number for the ring protection link (RPL) owner.

Default

N/A.

Usage Guidelines

Use this command to add ring protection link (RPL) owner configuration for the ERPS ring.

Note
This command implicitly makes the node on which it is configured the RPL owner.

Example

The following command adds RPL owner configuration on port 5 to an ERPS ring named “ring1”:

```
configure erps ring1 protection-port 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps revert

```
configure {erps} ring-name revert [ enable | disable ]
```

Description

Add or delete *ERPS* revert operation along with the "wait-to-restore" time interval.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
enable	Enable revert mode to ERPS ring.
disable	Disable revert mode from ERPS ring.

Default

The default is the revertive mode (enable).

Usage Guidelines

Use this command to enable/disable a G.8032 ring to revert to the original ring protection link (RPL) block state.

Example

The following command disables revert mode from an ERPS ring named "ring1":

```
configure erps ring1 revert disable
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps ring-ports east | west

```
configure erps ring-name ring-ports [east | west] port
```

Description

Add ring ports on the *ERPS* ring. Ths ring ports connect the switch to the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
east	Add the ring port to the east port of the switch.
west	Add the ring port to the west port of the switch.
port	The slot:port number for the ring port.

Default

N/A.

Usage Guidelines

Use this command to add ring ports on the ERPS ring. The ring ports can be added to the east or west port of the switch. The ring ports connect the switch to the ERPS ring.

Example

The following command adds port 5 as a ring port on the east port of the switch for an ERPS ring named “ring1”:

```
configure erps ring1 add ring-ports east 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps subring-mode

```
configure erps ring_name subring-mode [no-virtualChannel |
   virtualChannel]
```

Description

Configures sub-ring mode.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
no-virtualChannel	No Virtual Channel required to complete it's control path.
virtualChannel	Virtual Channel required to complete it's control path.

Default

N/A.

Usage Guidelines

Use this command to add or delete ERPS sub-rings.

Example

The following example configures a virtual channel for the control path:

```
configure erps ring1 subring-mode virtualChannel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

configure erps sub-ring

configure {**erps**} *ring-name* [**add** | **delete**] **sub-ring-name** *sub_ring*

Description

Add or delete a sub-ring to the main ring.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
add	Add sub-ring.
delete	Delete sub-ring.
sub_ring	Alphanumeric string identifying the ERPS sub-ring.

Default

N/A.

Usage Guidelines

Use this command to add or delete ERPS sub-rings.

Example

The following example adds sub-ring “ring2” to “ring1”:

```
configure erps ring1 add sub-ring-name ring2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer guard

configure {**erps**} *ring-name* **timer guard** [**default** | *milliseconds*]

Description

Configure a guard timer to control when the node should act on received R-APS (ring automatic protection switching) messages.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
default	The default value, 500 milliseconds.
milliseconds	The interval for the guard timer in milliseconds, with a range of 10 to 2000.

Default

The default is 500 milliseconds.

Usage Guidelines

Use this command to configure a guard timer to control when the node should act on received R-APS messages.

Example

The following command sets the guard timer to 1000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer guard 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer hold-off

configure {**erps**} *ring-name* **timer hold-off** [**default** | *milliseconds*]

Description

Configure a hold-off timer to control when a signal fault is relayed.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
default	The default value, 0 milliseconds.
milliseconds	The interval for the hold-off time in milliseconds, with a range of 0 to 10000.

Default

The default is 0 milliseconds.

Usage Guidelines

Use this command to configure a hold-off timer to control when a signal fault is relayed.

Example

The following command sets the hold-off timer to 1000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer hold-off 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer periodic

```
configure {erps} ring-name timer periodic [ default | milliseconds ]
```

Description

Configure a periodic timer to control the interval between signal failures.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
default	The default value, 5000 milliseconds.
milliseconds	The interval for the periodic time in milliseconds, with a range of 2000 to 7000.

Default

The default is 5000 milliseconds.

Usage Guidelines

Use this command to configure a periodic timer to control the interval between signal failure.

Example

The following command sets the periodic timer to 6000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer periodic 6000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer wait-to-block

```
configure {erps} ring-name timer wait-to-block [ default | milliseconds]
```

Description

Configure a wait-to-block timer for revertive operations on RPL owner initiated reversion.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
default	The default value, 5500 milliseconds.
milliseconds	The time interval to wait before restoring, with a range of 5000 to 7000 milliseconds.

Default

The default is 5500 milliseconds.

Usage Guidelines

Use this command to configure a wait-to-block timer for revertive operations on RPL owner-initiated reversion.

Example

The following command sets the wait-to-block timer to 6000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer wait-to-block 6000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer wait-to-restore

```
configure {erps} ring-name timer wait-to-restore [ default |
   milliseconds ]
```

Description

Configure a time interval to wait before restoring.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
default	The default value, 300000 milliseconds.
milliseconds	The time interval to wait before restoring, with a range of 0 to 720000 milliseconds.

Default

The default is 300000 milliseconds.

Usage Guidelines

Use this command to configure a time interval to wait before restoring.

Example

The following command sets the wait-to-restore timer to 3000 milliseconds for an ERPS ring named "ring1":

```
configure erps ring1 timer wait-to-restore 3000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps topology-change

configure erps *ring-name* [**add** |**delete**] **topology-change***ring-list*

Description

Identify the rings to which topology change events need to be propagated.

Syntax Description

ring-name	Alphanumeric string that identifies the *ERPS* ring.
add	Add rings/sub-rings to topology change propagation list.
delete	Delete rings/sub-rings from topology change propagation list.
ring-list	List of ERPS rings/sub-rings to which topology change needs to be propagated.

Default

N/A.

Usage Guidelines

Use this command to add or delete ERPS rings/sub-rings from the topology change propagation list.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure esrp add elrp-poll ports

```
configure esrp esrpDomain add elrp-poll ports [ports | all]
```

Description

Configures the ports of an *ESRP* domain where ELRP packet transmission is requested by ESRP.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ports	Specifies list of slots and ports.
all	Specifies all ports in the ESRP domain.

Default

All ports of an ESRP domain have ELRP transmission enabled.

Usage Guidelines

This command allows you to configure the ports in your network that might experience loops, such as ports that connect to master, slave, or ESRP-aware switches, to receive ELRP packets. You do not need to send ELRP packets to host ports.

Example

The following command enables ELRP packet transmission for slot 2, ports 3-5 on ESRP domain esrp1:

```
configure esrp esrp1 add elrp-poll ports 2:3-2:5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add master

`configure esrp` *`esrpDomain`* **`add master`** *`vlan_name`*

Description

Adds a master *VLAN* to an *ESRP* domain.

Syntax Description

`esrpDomain`	Specifies the name of an ESRP domain.
`vlan_name`	Specifies the name of the master VLAN.

Default

N/A.

Usage Guidelines

You must configure one master VLAN for each ESRP domain. A master VLAN can belong to one ESRP domain only. An ESRP domain contains one master and zero or more member VLANs.

The master VLAN:

- Exchanges ESRP PDUs, hello messages, and data between a pair of ESRP-enabled switches.
- Contains the total number of active physical ports that are counted when determining the master ESRP domain. The switch with the highest number of active ports takes priority.

Master VLANs can have their own set of ports, and member VLANs can have a different set of ports. The state of the ESRP device determines whether the ports in the master and member VLANs are in the forwarding or blocking state.

Example

The following command adds VLAN purple to the ESRP domain esrp1 as the master VLAN:

```
configure esrp esrp1 add master purple
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add member

```
configure esrp esrpDomain add member vlan_name
```

Description

Adds a member *VLAN* to an *ESRP* domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the member VLAN.

Default

N/A.

Usage Guidelines

You can configure zero or more member VLANs for each ESRP domain. An ESRP domain contains one master and zero or more member VLANs.

Master VLANs can have their own set of ports, and member VLANs can have a different set of ports. The state of the ESRP device determines whether the ports in the master and member VLANs are in the forwarding or blocking state.

Example

The following command adds VLAN green to the ESRP domain esrp1 as a member VLAN:

```
configure esrp esrp1 add member vlan green
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add track-environment

```
configure esrp esrpDomain add track-environment failover priority
```

Description

Configures an *ESRP* domain to track environmental failures.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
priority	Specifies a number between 0 and 254. The default priority is 255. See the following "Usage Guidelines" section for more information.

Default

No environmental tracking.

Usage Guidelines

Environmental tracking tracks power supply temperature status.

If a failure is detected, the ESRP domain priority steps to the failover-priority value specified. By setting the failover priority to be lower than the normal priority of the domain, it causes the affected domain to go into slave mode.

The range of the priority value is 0 to 254. Setting the priority to 255 configures the switch to slave mode, and to be ineligible to become the master. The switch remains in slave mode even when the *VLAN* fails over from the current master.

To make effective use of this feature, the normal priority of the ESRP domain must be higher than the failover priority of this command.

Example

The following command enables environmental failure tracking, and specifies that the ESRP priority for ESRP domain esrp1 be set to 10 upon an environmental failure.

```
configure esrp esrp1 add track-environment failover 10
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add track-iproute

```
configure esrp esrpDomain add track-iproute ipaddress/masklength
```

Description

Configures an *ESRP* domain to track a route entry in the system's routing table.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of the route entry to be tracked.
masklength	Specifies the subnet of the route entry to be tracked.

Default

Disabled.

Usage Guidelines

The track-ip metric consists of the total number of tracked IPv4 routes that are up or functional.

An ESRP domain can track eight IPv4 routes.

Note

ESRP route tracking is not supported on IPv6 networks.

Example

The following command enables IPv4 route failure tracking for routes to the specified subnet:

```
configure esrp esrp1 add track-iproute 192.168.46.0/24
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add track-ping

```
configure esrp esrpDomain add track-ping ipaddress {frequency seconds}
   {miss misses} {success successes}
```

Description

Configures an *ESRP* domain to track an external gateway using ping.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of the external gateway.
frequency	Specifies setting the interval between ping requests.
seconds	Sets the value for the interval in seconds between ping requests. The range is 1 to 600 seconds. Default is 15.
miss	Specifies the number of consecutive ping fails required for tracking fail.
misses	Sets the number of consecutive failed pings to declare tracking has failed. Range is 1 to 256. Default is 4.
success	Specifies setting the number of consecutive ping successes required for tracking success.
successes	Sets the number of consecutive successful pings to declare tracking has succeeded. Range is 1 to 256. Default is 4.

Default

No ping tracking.

Ping successes required for tracking to succeed is 4 by default.

Ping fails required for tracking to fails is 4 by default.

The interval between ping requests is 15 seconds by default.

Usage Guidelines

The tracked-ping metric consists of the total number of stations that are successfully tracked using ping. ESRP uses an aggregate of tracked pings and traced routes to track an external gateway.

An ESRP domain can track eight stations.

Note

ESRP ping tracking is not supported on IPv6 networks.

To change any of the options for track-ping, you must delete track-ping on the ESRP domain (`configure esrp` *esrpDomain* **delete track-ping** *ipaddress*), and then configure it as desired.

To view track-ping options, use the command `show esrp { {`*name*`} | {`**type** `[`**vpls-redundancy** | **standard**`]} }` .

Example

The following command enables ping tracking for the external gateway at 10.207.29.17, pinging every 10 seconds, and considering the gateway to be unreachable if no response is received to 5 consecutive pings:

```
configure esrp esrp1 add track-ping 10.207.29.17 frequency 10 miss 5
```

History

This command was first available in ExtremeXOS 11.0.

The **success** option was added in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp add track-vlan

`configure esrp` *esrpDomain* **add track-vlan** *vlan_name*

Description

Configures an *ESRP* domain to track port connectivity to a specified *VLAN*.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
vlan_name	Specifies the VLAN to be tracked.

Default

Disabled.

Usage Guidelines

The track-vlan metric is derived from the total number of active physical ports on the VLAN being tracked by the ESRP domain.

If more than one VLAN shares a physical link, each VLAN counts the physical link.

The ESRP switch should have a higher priority number than its neighbors to ensure master election.

An ESRP domain can track one VLAN, and the tracked VLAN should not be a member of any other ESRP domain in the system.

Example

The following command enables ESRP domain esrp1 to track port connectivity to VLAN engineering:

```
configure esrp esrp1 add track-vlan engineering
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp aware add selective-forward-ports

configure esrp *domain* **aware add selective-forward-ports** *port_list* {**group** *group number*}

Description

Enables selective forwarding by creating an aware port list and adds additional ports to the list.

Syntax Description

domain	Specifies an *ESRP* domain name.
port_list	Specifies the ports to be added to the aware port list.
group number	Specifies the ESRP group within the given domain name

Default

The group number defaults to '0'.

Usage Guidelines

An ESRP-aware switch floods ESRP PDUs from all ports in an ESRP-aware *VLAN*. This flooding creates unnecessary network traffic because some ports forward ESRP PDUs to switches that are not running the same ESRP groups. You can select the ports that are appropriate for forwarding ESRP PDUs by configuring selective forwarding on an ESRP-aware VLAN and thus reduce this excess traffic. Configuring selective forwarding creates a port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. This ESRP-aware port list is then used for forwarding ESRP PDUs.

Use this command to create or add to an existing port list for the ESRP groups associated with an ESRP-aware VLAN.

Example

The following command configures esrp domain (d1) to forward ESRP PDUs on ports 5:1, 5:2, and 6:2.

```
configure esrp d1 aware add selective-forward-ports 5:1,5:2,6:2 group 0
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp aware delete selective-forward-ports

`configure esrp` *`domain`* **`aware delete selective-forward-ports all`**|*`port_list`*
{**`group`** *`group number`* }

Description

Disables all or part of selective forwarding by deleting ports from the *ESRP*-aware port list.

Syntax Description

`domain`	Specifies an ESRP domain name.
`all`	Specifies that all of the ports are to be disabled.
`port_list`	Specifies the ports to be disabled from the ESRP-aware port list.
`group number`	Specifies the ESRP group within the given domain name

Default

The group number defaults to '0'.

Usage Guidelines

By configuring selective forwarding, you create an ESRP-aware port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware *VLAN*. That port list is used for forwarding ESRP PDUs from the selected ports only of an ESRP-aware switch.

Use this command to delete one or more or all of the ports from an ESRP-aware port list. Deleting all of the ports puts the domain back to the default state.

Example

The following command configures esrp domain (d1) to exclude ESRP PDUs on ports 5:1, 5:2, and 6:2.

```
configure esrp d1 aware delete selective-forward-ports 5:1,5:2,6:2 group 0
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete elrp-poll ports

configure esrp *esrpDomain* **delete elrp-poll ports** [*ports* | **all**]

Descriptioin

Disables ELRP packet transmission on ports of an *ESRP* domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ports	Specifies list of slots and ports in the ESRP domain.
all	Specifies all ports in the ESRP domain.

Default

All ports of an ESRP domain have ELRP transmission enabled.

Usage Guidelines

If you have host ports on an ESRP domain, you do not need to send ELRP packets to those ports.

If you change your network configuration, and a port no longer connects to a master, slave, or ESRP-aware switch, you can disable ELRP transmission on that port.

Example

The following command disables ELRP packet transmission for slot 2, ports 3-5 on ESRP domain esrp1:

```
configure vlan esrp1 delete elrp-poll ports 2:3-2:5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete master

```
configure esrp esrpDomain delete master vlan_name
```

Description

Deletes the specifies master *VLAN* from the specified *ESRP* domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the master VLAN.

Default

N/A.

Usage Guidelines

You must disable the ESRP domain before removing the master VLAN. To disable the ESRP domain, use the `disable esrp {esrpDomain}` command.

If you attempt to remove the master VLAN before disabling the ESRP domain, the switch displays an error message similar to the following:

```
ERROR: Failed to delete master vlan for domain "esrp1" ; ESRP is enabled!
```

If this happens, disable the ESRP domain and re-issue the `configure esrp delete master` command.

Example

The following command deletes the master VLAN purple from the ESRP domain esrp1:

```
configure esrp esrp1 delete master purple
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete member

```
configure esrp esrpDomain delete member vlan_name
```

Description

Deletes a member *VLAN* from the specified *ESRP* domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the member VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the member VLAN green from the ESRP domain esrp1:

```
configure esrp esrp1 delete member vlan green
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete track-environment

```
configure esrp esrpDomain delete track-environment
```

Descriptioin

Disables environmental failure tracking for an *ESRP* domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.

Default

No environmental tracking.

Usage Guidelines

None.

Example

The following command disables environmental failure tracking for ESRP domain esrp1:

```
configure esrp esrp1 delete track-environment
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete track-iproute

`configure esrp` *esrpDomain* **`delete track-iproute`** *ipaddress/masklength*

Description

Disables route entry tracking for an *ESRP* domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of a tracked route entry.
masklength	Specifies the subnet of a tracked route entry.

Default

Disabled.

Usage Guidelines

If you disable route tracking for a failed route, the ESRP domain recovers from the forced standby state.

If you disable route tracking for a route that is up and functional, there is no impact on the ESRP state.

Example

The following command disables tracking of routes to the specified subnet for ESRP domain esrp1:

```
configure esrp esrp1 delete track-iproute 192.168.46.0/24
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete track-ping

`configure esrp` *`esrpDomain`* **`delete track-ping`** *`ipaddress`*

Description

Disables the tracking of an external gateway using ping.

Syntax Description

esrpDomain	Specifies an *ESRP* domain name.
ipaddress	Specifies the IPv4 address of the external gateway.

Default

No ping tracking.

Usage Guidelines

If you disable ping tracking for a failed ping, the ESRP domain recovers from the forced standby state.

If you disable route tracking for a successful ping, there is no impact on the ESRP state.

Example

The following command disables ping tracking for the external gateway at 10.207.29.17:

```
configure esrp esrp1 delete track-ping 10.207.29.17
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp delete track-vlan

```
configure esrp esrpDomain delete track-vlan vlan_name
```

Description

Disables the tracking of port connectivity to a specified *VLAN*.

Syntax Description

esrpDomain	Specifies an *ESRP* domain name.
vlan_name	Specifies the VLAN to be tracked.

Default

Disabled.

Usage Guidelines

If you delete a VLAN that is down, the ESRP domain recovers from the forced standby state.

Example

The following command disables the tracking of port connectivity to VLAN engineering:

```
configure esrp esrp1 delete track-vlan engineering
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp domain-id

```
configure esrp esrpDomain domain-id number
```

Description

Assigns an *ESRP* domain ID to an ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
number	Specifies the number to use for the ESRP domain ID. The user-configured ID range is 4096 through 65,535.

Default

If the master *VLAN* is tagged, ESRP uses that VLANid for the ESRP domain ID. If the master VLAN is untagged, you must specify the ESRP domain ID.

Usage Guidelines

Before you enable a specific ESRP domain, it must have a domain ID. A domain ID is either a user-configured number or the VLANid of the tagged master VLAN. If you do not have a domain ID, you cannot enable ESRP on that domain.

Each switch participating in ESRP for a particular domain must have the same domain ID configured.

The number parameter range for user-configured domain IDs is 4096 through 65,535.

If the master VLAN is tagged, you can use that VLANid for the ESRP domain ID. The range for VLAN tags is 2 through 4095. Tag 1 is assigned to the default VLAN.

Example

The following command assigns the domain ID 5000 to ESRP domain esrp1:

```
configure esrp esrp1 domain-id 5000
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp election-policy

```
configure esrp esrpDomain election-policy [ports > track > priority |
   ports > track > priority > mac | priority > mac | priority > ports >
   track > mac | priority > track > ports > mac | sticky > ports > track
   > priority | sticky > ports > track > priority > mac | sticky > ports
```

> weight > track > priority > mac | **sticky > priority > mac** | **sticky > priority > ports > track > mac** | **sticky > priority > track > ports > mac** | **sticky > track > ports > priority** | **sticky > track > ports > priority > mac** | **track > ports > priority** | **track > ports > priority > mac**]

Description

Configures the election algorithm on the switch.

Syntax Description

esrpDomain	Specifies an *ESRP* domain name.
ports > track > priority	Specifies that this ESRP domain should consider election factors in the following order: Active ports, tracking information, ESRP priority.
ports > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Active ports, tracking information, ESRP priority, MAC address. Note: This is the default election algorithm for standard mode.
priority > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, MAC address.
priority > ports > track > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, active ports, tracking information, MAC address.
priority > track > ports > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, tracking information, active ports, MAC address.
sticky > ports > track > priority	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, tracking information, ESRP priority.
sticky > ports > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, tracking information, ESRP priority, MAC address.
sticky > ports > weight > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, port weight, tracking information, ESRP priority, MAC address. Note: Beginning with ExtremeXOS 11.1 and later, this is the default election algorithm for extended mode.
sticky > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, MAC address.
sticky > priority > ports > track > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, active ports, tracking information, MAC address.
sticky > priority > track > ports > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, tracking information, active ports, MAC address.

sticky > track > ports > priority	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, tracking information, active ports, ESRP priority.
sticky > track > ports > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, tracking information, active ports, ESRP priority, MAC address.
track > ports > priority	Specifies that this ESRP domain should consider election factors in the following order: Tracking information, active ports, ESRP priority.
track > ports > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Tracking information, active ports, ESRP priority, MAC address.

Default

In extended mode, the default election algorithm is sticky > ports > weight > track > priority > mac.

In standard mode, the default election algorithm is ports > track > priority > mac.

Usage Guidelines

The election algorithm determines the order of precedence of the election factors used to determine the ESRP Master. The election factors are:

- Stickiness (sticky): the switch with the higher sticky value has higher priority. When an ESRP domain claims master, its sticky value is set to 1 (available in extended mode only).
- Active Ports (ports): the number of active ports (the switch with the highest number takes priority)
- Tracking Information (track): whether the switch is using ESRP tracking. A switch using tracking has priority.
- ESRP Priority (priority): a user-defined priority number between 0 and 254. A higher number has higher priority. The default priority setting is 0. A priority setting of 255 makes an ESRP switch a standby switch that remains in slave mode until you change the priority setting. We recommend this setting for system maintenance. A switch with a priority setting of 255 never becomes the master.
- MAC address (mac): the switch MAC address. A higher-number address has priority.
- Active port weight (weight)—The switch that has the highest port weight takes precedence. The bandwidth of the port automatically determines the port weight (available only in extended mode). ESRP does not count ports with a weight of 0 (known as don't count ports) regardless of ESRP running in extended or standard mode.

The election algorithm must be the same on all switches for a particular ESRP domain. The election algorithms that use sticky are and weight are available in extended mode only.

In ExtremeXOS 11.0, the extended mode default election algorithm is: sticky > ports > track > priority > mac > weight. This election algorithm is not supported in ExtremeXOS 11.1.

Factors to Consider

The ports-track-priority or track-ports-priority options can be used to ensure that there is no failback if the original Master recovers (the Master has the same ports, tracks and priority, but a higher MAC).

Any of the options with sticky can also be used to ensure that there is no failback if the original master recovers. With sticky, if an event causes the ESRP master to failover, ESRP assigns the new master with the sticky count of 1. After sticky is set on the master, regardless of changes to its neighbor's election algorithm, the new master retains its position. For example, adding active ports to the slave does not cause the new master to failback to the original master, even if the slave has more active ports than the master. Sticky algorithms provide for fewer network interruptions than non-sticky algorithms. Sticky is set on the master switch only.

ESRP re-election can occur if sticky is set on the master and a local event occurs. During this time, if the current master has lower election parameters, the backup can become the new master.

Switch Behavior

If a switch is master, it actively provides Layer 3 routing services to other *VLAN*s, and Layer 2 switching between all the ports of that VLAN. Additionally, the switch exchanges ESRP packets with other switches that are in slave mode.

If a switch is in slave mode, it exchanges ESRP packets with other switches on that same VLAN. When a switch is in slave mode, it does not perform Layer 3 routing or Layer 2 switching services for the VLAN.

Updating the Election Algorithm

ESRP uses the default election policy for extended mode. If you have an ESRP domain operating in standard mode, the domain ignores the sticky and weight algorithms. To change the election algorithm, you must first disable the ESRP domain and then configure the new election algorithm. If you attempt to change the election algorithm without disabling the domain first, an error message appears.

To disable the ESRP domain, use the following command:

```
disable esrp {esrpDomain}
```

To modify the election algorithm, use the following command:

```
configure esrp esrpDomain election-policy [ports > track > priority |
ports > track > priority > mac | priority > mac | priority > ports >
track > mac | priority > track > ports > mac | sticky > ports > track
> priority | sticky > ports > track > priority > mac | sticky > ports
> weight > track > priority > mac | sticky > priority > mac | sticky >
priority > ports > track > mac | sticky > priority > track > ports > mac
| sticky > track > ports > priority | sticky > track > ports > priority
> mac | track > ports > priority | track > ports > priority > mac]
```

If you attempt to use an election algorithm not supported by the switch, an error message similar to the following appears:

```
ERROR: Specified election-policy is not supported!
Supported Policies:
1. sticky > ports > weight > track > priority > mac
2. ports > track > priority
3. sticky > ports > track > priority
4. ports > track > priority > mac
5. sticky > ports > track > priority > mac
6. priority > mac
```

```
7. sticky > priority > mac
8. priority > ports > track > mac
9. sticky > priority > ports > track > mac
10. priority > track > ports > mac
11. sticky > priority > track > ports > mac
12. track > ports > priority
13. sticky > track > ports > priority
14. track > ports > priority > mac
15. sticky > track > ports > priority > mac
```

Example

The following example configures the election algorithm to use tracking information as the first criteria for determining the ESRP master switch for ESRP domain esrp1:

```
configure esrp esrp1 election-policy track > ports > priority > mac
```

History

This command was first available in ExtremeXOS 11.0.

The default election algorithm for extended mode was updated to sticky > ports > weight > track > priority > mac, and the weight election factor was used in ExtremeXOS 11.1. The sticky > ports > track > priority > mac > weight election algorithm is not supported in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp elrp-master-poll disable

`configure esrp` *`esrpDomain`* **`elrp-master-poll disable`**

Description

Disables the use of ELRP by *ESRP* in the master state.

Syntax Description

esrpDomain	Specifies an ESRP domain name.

Default

Disabled.

Usage Guidelines

Use this command to disable the use of ELRP by ESRP in the master state. When you disable ELRP, the ESRP master switch no longer transmits ELRP PDUs to detect network loops.

Example

The following command disables the use of ELRP in the master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-master poll disable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp elrp-master-poll enable

```
configure esrp esrpDomain elrp-master-poll enable {interval interval}
```

Description

Enables the use of ELRP by *ESRP* in the master state, and configures how often the master checks for loops in the network.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
interval	Specifies how often, in seconds, successive ELRP packets are sent. The default is 1 second. The range is 1 to 64 seconds.

Default

- Use of ELRP in the master state—disabled
- Interval—1 second

Usage Guidelines

Use this command to enable the use of ELRP by ESRP in the master state. When an ESRP-enabled switch is in the master state, and you enable elrp-master-poll, the switch periodically sends ELRP PDUs at the configured interval level. If a loop is detected in the network, the transmitted PDUs are received by the switch. The ESRP master switch then transitions to the slave state to break the network loop.

We recommend that you enable both premaster and master polling when using ELRP with ESRP. To enable premaster polling, use the `configure esrp esrpDomain elrp-premaster-poll enable {count count | interval interval}`.

If you attempt to configure master polling before premaster polling, the switch displays an error message similar to the following:

```
ERROR: Premaster-poll should be enabled before enabling master-poll!
```

If this happens, first configure premaster polling followed by master polling (if required).

Specify the interval parameter to configure how often successive ELRP PDUs are sent while in the master state. If you do not specify an interval value, the default value is used.

Example

The following command enables the use of ELRP in the master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-master poll enable
```

The following command configures the ESRP master to check for loops in the network every 3 seconds:

```
configure esrp elrp1 esrp elrp-master-poll enable interval 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp elrp-premaster-poll disable

`configure esrp` *`esrpDomain`* **`elrp-premaster-poll disable`**

Description

Disables the use of ELRP by *ESRP* in the pre-master state.

Syntax Description

`esrpDomain`	Specifies an ESRP domain name.

Default

Disabled.

Usage Guidelines

Use this command to disable the use of ELRP by ESRP in the pre-master state. When you disable ELRP in the pre-master state, the ESRP pre-master switch no longer transmits ELRP PDUs to detect network loops prior to changing to the master state.

Example

The following command disables the use of ELRP in the pre-master state on the ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-premaster poll disable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp elrp-premaster-poll enable

```
configure esrp esrpDomain elrp-premaster-poll enable {count count |
   interval interval}
```

Description

Enables the use of ELRP by *ESRP* in the pre-master state, and configures how many times the switch sends ELRP PDUs and how often the switch sends ELRP PDUS in the pre-master state.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
count	Specifies the number of times the switch sends ELRP PDUs. The default is 3. The range is 1 to 32.
interval	Specifies how often, in seconds, the ELRP PDUs are sent. The default is 1 second. The range is 1 to 32 seconds.

Default

- Use of ELRP in the pre-master state—disabled
- Count—3 times
- Interval—1 second

Usage Guidelines

Use this command to enable the use of ELRP by ESRP in the pre-master state to prevent network loops from occurring. When an ESRP-enabled switch is in the pre-master state (waiting to become the master), and you enable elrp-premaster-poll, the switch periodically sends ELRP PDUs at the configure level for a specified number of times. If there is a loop in the network, the transmitted PDUs are received by the switch. If this happens, the ESRP pre-master switch does not transition to the master state; rather, the switch transitions to the slave state.

We recommend that you enable both premaster and master polling when using ELRP with ESRP. To enable master polling, use the `configure esrp esrpDomain elrp-master-poll enable {interval interval}`.

If you attempt to configure master polling before premaster polling, the switch displays an error message similar to the following:

```
ERROR: Premaster-poll should be enabled before enabling master-poll!
```

If this happens, first configure premaster polling followed by master polling (if required).

If you do not specify the optional count or interval parameters, the default values are used.

If the sender does not receive packets, there is no loop in the network.

Example

The following command enables the use of ELRP—with the default settings—in the pre-master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-premaster poll enable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp group

```
configure esrp esrpDomain group number
```

Description

Configures the group number to be used for the *ESRP* domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
group number	Specifies the ESRP group number to which this ESRP domain should be added. The range is 0 through 31.

Default

The default group number is 0.

Usage Guidelines

Each group runs an instance of ESRP within the same *VLAN* or broadcast domain. A maximum of seven ESRP groups can be defined within the same networked broadcast domain. In addition, a maximum of seven distinct ESRP groups can be supported on a single ESRP switch. You can configure a maximum of 32 ESRP groups in a network.

The range for the group_number parameter is 0 through 31.

The most typical application for multiple ESRP groups is when two or more sets of ESRP switches are providing fast-failover protection within a common subnet for two or more groups of users. An additional use for ESRP groups is ESRP Host Attach; ESRP VLANs that share the same ESRP HA ports must be members of different ESRP groups.

You must first disable an ESRP domain before you modify an existing or add a new group number. If you try to modify the group number without disabling the ESRP domain, an error message similar to the following is displayed:

```
ERROR: can't change ESRP group for active domain "esrp1"!
```

To disable an ESRP domain, use the `disable esrp {esrpDomain}` command.

Example

The following command configures ESRP domain esrp1 to be a member of ESRP group 2:

```
configure esrp esrp-1 group 2
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp mode

```
configure esrp mode [extended | standard]
```

Description

Configures the mode of operation for *ESRP* on the switch.

Syntax Description

extended	Specifies ESRP extended mode for devices running both non-Universal and modern NOS versions.
standard	Specifies ESRP standard mode for devices running modern NOS versions.

Default

The default mode is extended.

Example

The following command configures ESRP to run in standard mode:

```
configure esrp mode standard
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp name

`configure esrp` *`esrpDomain`* **`name`** *`new-name`*

Description

Renames an existing *ESRP* domain.

Syntax Description

esrpDomain	Specifies the current name of an ESRP domain.
new-name	Specifies a new name for the ESRP domain.

Default

N/A.

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, esrp. Names must start with an alphabetical character, for example, a, Z.

You can rename an ESRP domain regardless of its current state.

Example

The following command renames ESRP domain esrp1 to esrp3:

```
configure esrp esrp1 name esrp3
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp ports mode

```
configure esrp ports ports mode [host | normal]
```

Description

Configures the *ESRP* port mode for ESRP host attach.

Syntax Description

ports	Specifies one or more ports or slots and ports that should be configured.
host	Specifies that the ports should be configured as host ports.
normal	Specifies that the ports should be configured as normal ports.

Default

The default port mode is normal.

Usage Guidelines

Ports configured as normal ports do not accept or transmit Layer 2 or Layer 3 traffic when the local ESRP device is a slave.

Ports configured as host ports allow the network to continue operation independent of ESRP status. The command sets the port to forward, allowing those ports directly attached to the slave's hosts to communicate with other hosts that are connected to the master. If you use load sharing with the ESRP HA feature, configure the load-sharing group first and then enable Host Attach on the group.

A Layer 2 connection for VLANs between ESRP switches is required.

An ESRP Host Attach port cannot be a mirroring port, software-controlled redundant port, or Netlogin port.

Example

The following command configures ports 1 through 5 on slot 3 as host ports:

```
configure esrp port 3:1-3:5 mode host
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp ports no-restart

`configure esrp ports` *`ports`* **`no-restart`**

Description

Disables port restart for a port.

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables port restart for ports 7-9 in slot 3 in the *ESRP* master domain:

```
configure esrp port 3:7-3:9 no-restart
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp ports restart

```
configure esrp ports ports restart
```

Description

Configures *ESRP* to restart ports if there is a state change and the downstream switch is from another vendor.

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

If an ESRP domain becomes a slave, ESRP disconnects member ports that have port restart enabled. The disconnection of these ports causes downstream devices to remove the ports from their *FDB* tables. After 3 seconds the ports re-establish connection with the ESRP-enabled device. This feature allows you to use ESRP in networks that include equipment from other vendors.

If switch becomes a slave, ESRP disconnects the physical links of member ports that have port restart enabled.

An ESRP restart port cannot be a mirroring port, software-controlled redundant port, or Netlogin port.

Example

The following command enables port restart for ports 7-9 in slot 3 on the ESRP master domain:

```
configure esrp port 3:7-3:9 restart
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp ports weight

```
configure esrp ports ports weight [auto | port-weight]
```

Description

Assigns the port weight for the specified *ESRP* port(s).

Syntax Description

ports	Specifies one or more ports or slots and ports.
auto	Specifies the switch to calculate the weight of a port based on the port's bandwidth and link speed.
port-weight	Specifies an ESRP port weight of 0. With a port weight of 0, the ports are not counted.

Default

The switch automatically calculates the weight of a port based on the bandwidth of the port.

Usage Guidelines

Use this command to override the automatically calculated port weight.

The port-weight parameter specifies a weight of 0. With this configuration, ESRP does not count host ports and normal ports as active. With a weight of 0, ESRP experiences fewer state changes due to frequent client activities like rebooting and unplugging laptops. A don't-count port cannot be a mirroring, software-controlled redundant port, or a Netlogin port.

For load shared ports, configure one master port in the load-share group with the port weight. A single command specifies the weight for the entire load shared group. You can specify any port from the load share group in the command. A load-shared port has an aggregate weight of all of its member ports. If you add or delete a member port (or trunk), the weight of the master load-shared port is updated. For more information about load sharing, see Configuring Slots and Ports on a Switch.

Example

The following command configures port 1 on slot 3 with a weight of 0:

```
configure esrp port 3:1 weight 0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp priority

```
configure esrp esrpDomain priority number
```

Description

Configures the *ESRP* priority.

Syntax Description

esrpDomain	Specifies an ESRP domain number.
number	Specifies a number between 0 and 255.

Default

The default ESRP priority is 0.

Usage Guidelines

The ESRP priority is one of the factors used by the ESRP election algorithm in determining which switch is the Master switch.

The range of the priority value is 0 to 254, with 0 being the lowest priority, 254 being the highest. If the ESRP priority is the determining criteria for the election algorithm, the highest priority value determines which switch acts as master for a particular ESRP domain.

Setting the priority to 255 configures the switch to slave mode, and to be ineligible to become the master. The switch remains in slave mode even when the ESRP domain fails over from the current master. This feature is typically used to ensure a switch cannot become the ESRP master while it is offline for servicing.

Example

The following command configures the ESRP priority to the highest priority on ESRP domain esrp1:

```
configure esrp esrp1 priority 254
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp timer hello

`configure esrp` *esrpDomain* **`timer hello`** *seconds*

Description

Configures the *ESRP* hello timer value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the number of seconds between keep-alive packets. The range is 1 to 255 seconds.

Default

The default hello timer is 2 seconds.

Usage Guidelines

The timer specifies the interval, in seconds, for exchanging keep-alive packets between the ESRP switches for this ESRP domain. A lower value specifies a more frequent exchange of keep-alive messages, resulting in the faster detection of a failover condition. The timer setting must be configured identically for the ESRP domain across all participating switches. To see the hello settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

The seconds range is 1 to 255.

If your configuration contains more than 2,000 ESRP VLANs and 256,000 *FDB* entries, we recommend a timer setting greater than 3 seconds.

To view the hello timer settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

In a large ESRP configuration, the slave ESRP domain might inadvertently become the master ESRP domain. This can occur when FDB entries are flushed during a master-slave transition. To avoid this we recommend the general neighbor and hello timeout guidelines listed in Table 7 on page 505, which is described in the description for the `configure esrp timer neighbor` command.

Example

The following command configures the ESRP hello timer to 4 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer hello 4
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp timer neighbor

`configure esrp` *esrpDomain* **`timer neighbor`** *seconds*

Description

Configures the *ESRP* neighbor timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the number of seconds after which an ESRP neighbor times out. The range is 6 to 1024 seconds.

Default

The default neighbor timeout is 8 seconds (four times the hello timer).

Usage Guidelines

The neighbor timeout specifies the amount of time that ESRP waits before considering the neighbor down. The neighbor value must be at least 3 times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >=
3*hello ; neutral timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 3*hello to 1024 seconds.

To view the neighbor timer settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

In a large ESRP configuration, the slave ESRP domain might inadvertently become the master ESRP domain. This can occur when *FDB* entries are flushed during a master-slave transition. To avoid this we recommend the general neighbor and hello timeout guidelines listed in following table.

Table 7: General Neighbor and Hello Timeout

Number of Domains	Number of VLANs	Suggested Neighbor and Hello Timeout
64 or less	1000	Use the default timer values
64	1000 to 3000	hello >=3, neighbor >=9
128	3000	hello >=4, neighbor >=12

Example

The following command configures the ESRP neighbor timeout to 14 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer neighbor 14
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp timer neutral

Configures the *ESRP* neutral timeout value.
`configure esrp esrpDomain timer neutral seconds`

Description

Configures the ESRP neutral timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the number of seconds after which an ESRP domain. The range is 4 to 1024 seconds.

Default

The default neutral timeout is 4 seconds (two times the hello timer).

Usage Guidelines

After you create, configure, and enable the ESRP domain, it enters the neutral state. The neutral timeout specifies the amount of time the ESRP domain stays in this temporary state before entering the slave state. The neutral value must be at least 2 times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >=
3*hello ; neutral timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 2*hello to 1024.

To view the neutral timer settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

Example

The following command configures the ESRP neutral timeout to 8 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer neutral 8
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp timer premaster

```
configure esrp esrpDomain timer premaster seconds
```

Description

Configures the *ESRP* pre-master timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the maximum length of time, in seconds, that the transitioning master *VLAN* remains in the pre-master state. The range is 6 to 1024.

Default

The default timeout is 6 seconds (three times the hello timer).

Usage Guidelines

The premaster timer specifies how long the ESRP domain stays in the pre-master state. The pre-master timer expires if the neighbor agrees to be the slave. The premaster value must be at least three times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >=
3*hello ; neutral timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 3*hello-1024.

To view the pre-master timer settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

Caution

Configure the pre-master state timeout only with guidance from Extreme Networks personnel. Misconfiguration can severely degrade the performance of ESRP and your switch.

Example

The following command configures the pre-master timeout to 10 seconds for the ESRP domain esrp1:

```
configure esrp esrp-1 timer premaster 10
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure esrp timer restart

`configure esrp` *esrpDomain* **`timer restart`** *seconds*

Description

Configures the *ESRP* restart timer value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the maximum length of time, in seconds, that the neighbor ESRP switch remains in its current state during an hitless failover. The range is 2 to 1024.

Default

The default restart timer value is 2 seconds.

Usage Guidelines

The restart timer specifies the amount of time that the neighbor ESRP switch remains in its current state during a hitless failover. This timer prevent the slave ESRP switch from trying to become master during a hitless failover.

The seconds range is 2-1024.

To view the restart settings, use the `show esrp { {name} | {type [vpls-redundancy | standard]} }` command.

Example

The following command configures the restart timer value to 40 seconds for the ESRP domain esrp1:

```
configure esrp esrp-1 timer restart 40
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure failsafe-account

```
configure failsafe-account {[deny | permit] [all | control | serial |
   ssh {vr vr-name} | telnet {vr vr-name}]}
```

Description

Configures a name and password for the failsafe account, or restricts access to specified connection types.

Syntax Description

deny	Prohibits failsafe account usage over the specified connection type(s).
permit	Allows a failsafe account to be used over the specified connection type(s).
all	Specifies all connection types.
control	Specifies internal access between nodes in a SummitStack.
serial	Specifies access over the switch console port.
ssh	Specifies access using SSH on specified or all virtual routers.
telnet	Specifies access using Telnet on specified or all virtual routers.

Default

The failsafe account is always configured.

The default connection types over which failsafe account access is permitted are the same as if **permit all** is configured.

Usage Guidelines

The failsafe account is the account of last resort to access your switch.

If you use the command with no parameters, you are prompted for the failsafe account name and prompted twice to specify the password for the account. The password does not appear on the display at any time. You are not required to know the current failsafe account and password in order to change it.

If you use the command with the permit or deny parameter, the permitted connection types are altered as specified.

The failsafe account or permitted connection types are immediately saved to NVRAM on active nodes in a SummitStack.

Note

The information that you use to configure the failsafe account cannot be recovered by Extreme Networks. Technical support cannot retrieve passwords or account names for this account. Protect this information carefully.

Once you enter the failsafe account name, you are prompted to enter the password. Once you successfully log in to the failsafe account, you are logged in to an admin-level account.

Example

The following example restricts usage of the failsafe account to the series console port:

```
# configure failsafe-account deny all
# configure failsafe-account permit serial
# configure failsafe-account permit control
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach management-vlan

```
configure fabric attach management-vlan [vlan_id | vlan_name | untagged
   | none | forward [on | off] ]
```

Description

Specifies the VLAN advertised to Fabric Attach clients for them to use as the management VLAN.

Syntax Description

management-vlan	Specifies setting he VLAN advertised to Fabric Attach clients for them to use as the management VLAN. (Default is none.)
vlan_id	Specifies the Management VLAN ID tag (1 and 4,094).
vlan_name	Specifies the Management VLAN name. The VLAN must be a tagged VLAN.
untagged	Management traffic should be sent untagged.
none	No Fabric Attach Management VLAN is in use.
forward	Configures whether Fabric Attach proxy switches send Management VLAN data to clients.
on	Fabric Attach proxy switches send Management VLAN data to clients (default).
off	Fabric Attach proxy switches do not send Management VLAN data to clients.

Default

Unless configured, there is no Management VLAN by default.

If not specified, the Fabric Attach proxy switches send Management VLAN data to clients.

Usage Guidelines

Configuring the Fabric Attach Management VLAN is only relevant when operating as a Fabric Attach Server. It has no effect when operating as a client or proxy.

Fabric Attach Management VLAN forwarding configuration is relevant for all FA modes.

The management VLAN is advertised to Fabric Attach proxies and clients.

The specified VLAN configuration on the Fabric Attach server is restricted to only tagged VLANs.

Example

The following example sets the Management VLAN to a VLAN named "VLAN1" and specifies tagged traffic:

```
# configure fabric attach management-vlan VLAN1
```

History

This command was first available in ExtremeXOS 22.5.

The option to configure whether Fabric Attach proxy switches send Management VLAN data to clients was added in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach management-vlan ports

```
configure fabric attach management-vlan ports [port_list | all] forward
   [on | off]
```

Description

Configures the Fabric Attach management VLAN propagation on a specific port.

Syntax Description

management-vlan	Specifies setting he VLAN advertised to Fabric Attach clients for them to use as the management VLAN. (Default is none.)
ports	Specifies the port to configure.
port_list	Specifies a list of ports to configure.
all	Specifies configuring all ports in the system.
forward	Configures whether Fabric Attach proxy switches send Management VLAN data to clients.
on	Fabric Attach proxy switches send Management VLAN data to clients (default).
off	Fabric Attach proxy switches do not send Management VLAN data to clients.

Default

All ports are configured to propagate the management VLAN.

When disabled, the port will not send out the management VLAN information in the element TLV Support.

Usage Guidelines

This command is only used when operating as a Fabric Attach server. It has no effect when operating as a client or proxy.

Example

The following example disables Fabric Attach port 25 from sending Management VLAN data to clients.

```
# configure fabric attach management-vlan port 25 forward off
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach ports

```
configure fabric attach ports [port_list | all] enable | disable]
```

Description

Configures the Fabric Attach state per port.

Syntax Description

ports	Specifies the port to configure.
port_list	Specifies a list of ports to configure.
all	Specifies configuring all ports in the system.
enable	Specifies enabling Fabric Attach settings (default).
disable	Specifies disabling Fabric Attach settings.

Default

All ports are configured to transmit and receive Fabric Attach attributed by default.

Usage Guidelines

Use this command to enable or disable a port from adding the Fabric Attach TLVs to the LLDP packet.

Example

The following example disables Fabric Attach port 25:

```
# configure fabric attach port 25 disable
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach port authentication

```
configure fabric attach ports [port_list | all] authentication [ disable
   | enable | key {key | default | encrypted encrypted_key}]
```

Description

Configures Fabric Attach authentication.

Syntax Description

ports	Specify configuring ports.
port_list	Specifies list of ports to configure.
all	Configures all ports in the system.
authentication	Configures Fabric Attach authentication.
disable	Disable authentication setting (default).
enable	Enable authentication setting.
key	Configures Fabric Attach authentication key.
key	Specifies the authentication key.
default	Configures Fabric Attach authentication key to the default key. (Default when no 'key' is specified.)
encrypted	Configures Fabric Attach authentication key with encrypted key.
encrypted_key	Specifies the encrypted authentication key.

Default

By default, all ports are configured to authentication disabled state.

If no key is specified, the default key is used.

Usage Guidelines

When enabled, the default key is used until configured otherwise. If the authentication fails, the Fabric Attach information is dropped whether or not authentication is enabled on the receiving port.

When Fabric Attach authentication is configured on ports that are part of an , all ports on that MLAG must have the same Fabric Attach authentication configuration.

To view Fabric Attach authentication configuration, use the `show fabric attach` **ports** [*port_list* | **all**] **authentication** {**detail**} command. To view Fabric Attach authentication status, use the `show lldp` {**port** [**all** | *port_list*]} **neighbors** {**detailed**} command.

Example

The following example disables Fabric Attach authentication on all ports:

```
# configure fabric attach ports all authentication disable
```

The following example sets Fabric Attach authentication on port 1 with the default key:

```
# configure fabric attach ports 1 authentication key default
```

The following example sets Fabric Attach authentication on port 1 with the key "12345".

```
# configure fabric attach port 1 authentication key
Key: 12345
Reenter Key: 12345
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach uplink

`configure fabric attach` **`uplink`** [*port* | **`none`**]

Description

Configures the uplink port for and enables Fabric Attach standalone proxy operation.

Syntax Description

uplink	Uplink port for standalone proxy operation.
port	Enables standalone proxy operation using the specified port as the uplink.
none	Removes uplink port and disables standalone proxy operation (default).

Default

Standalone proxy mode is disabled (**none**) by default.

Usage Guidelines

Fabric Attach standalone proxy allows for Fabric Attach proxy functionality in environments without a Fabric Attach server.

The Fabric Attach standalone proxy does not send provisioning requests upstream. A Fabric Attach standalone proxy automatically accepts requests from Fabric Attach clients and assumes that the upstream network has been provisioned appropriately. Disabling Fabric Attach standalone proxy mode resets configured NSI/VLAN binding data to its default state and enables full Fabric Attach Proxy operation. In Fabric Attach standalone proxy mode, you must provide the Fabric Attach server uplink information, which is typically gathered through Fabric Attach server discovery. After you provide this information, Fabric Attach standalone proxy mode operates as if a Fabric Attach server has been discovered and is accepting NSI/VLAN binding requests. The binding clean-up is similar to a Fabric Attach server timeout event, and occurs when the static uplink is deleted and when Fabric Attach standalone proxy operation is disabled.

To confirm standalone poxy mode, use the `show fabric attach` **`statistics`** command with either the **`agent`** or **`elements`** option.

Example

The following example enables proxy mode and specifies port 10 as the uplink port:

```
# configure fabric attach uplink 10
```

The following example disables proxy mode:

```
# configure fabric attach uplink none
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fabric attach zero-touch-client

```
configure fabric attach zero-touch-client client [vlan [vlan_name |
   vlan_id] [nsi nsi | isid isid] {priority [priority | dot1p]} {enable
   | disable} | none] | enable | disable]
```

Description

Configures the Fabric Attach Zero Touch Client.

Syntax Description

zero-touch-client	Specifies Zero Touch Client.
client	Specifies the type of Fabric Attach client.
vlan	Specifies the VLAN on which to configure Zero Touch Clients.
vlan_name	Specifies the VLAN name. The VLAN must be a tagged VLAN.
vlan_id	Specifies the VLAN ID tag (1 and 4,094).
nsi	Network Service Identifier.
nsi	Specifies the Network Service Identifier. Range is 1-16777215.
insi	Individual Network Service Identifier
insi	Specifies the Individual Network Service Identifier. Range is 1-16777215.
priority	Specifies the Zero Touch port priority for untagged packets.
priority	Specifies the priority number to be used for untagged packets. Range is 0-7.

dot1p	Specifies the use of dot1p port priority for untagged packets (default).
none	Specifies no Zero Touch Client VLAN in use.
enable	Specifies enabling Zero Touch Clients.
disable	Specifies disabling Zero Touch Clients (default).

Default

Unless configured, all clients are configured to disabled state without a mapping.

Usage Guidelines

This command is only used when operating as a Fabric Attach server. It has no effect when operating as a client or proxy.

The specified VLAN configuration on the Fabric Attach server is restricted to only tagged VLANs.

Example

The following example configures the Fabric Attach Zero Touch Client "switch" with a VLAN named "V2000" and Individual Service Identifier of 2000 with a priority of 1 for untagged packets:

```
# configure fabric attach zero-touch-client switch vlan v2000 nsi 2000 priority 1
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fdb agingtime

`configure fdb agingtime` *`seconds`*

Description

Configures the *FDB* aging time for dynamic entries.

Syntax Description

agingtime	If agingtime is set to 0, all aging entries in the database are defined as static, nonaging entries.
seconds	Specifies the FDB aging time, in seconds. A value of 0 indicates that the entry should never be aged out. All other platforms support the value 0 (no aging) and a range of 15 to 1,000,000 seconds.

Default

300.

Usage Guidelines

If the aging time is set to 0 (zero), all dynamic entries in the database become static, nonaging entries. This means that they do not age out, but non-permanent static entries can be deleted if the switch is reset.

The software flushes the FDB table once the aging timeout parameter is reached, even if the switch is running traffic and populating addresses in the FDB table.

For ExtremeSwitching X460-G2 switches, the hardware flushes the FDB table at periods based on the configured software aging time. The actual hardware aging time does not exactly match the software aging time and can be as high as twice the configured software aging time.

Example

The following example sets the FDB aging time to 3,000 seconds:

```
# configure fdb agingtime 3000
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fdb mac-tracking ports

```
configure fdb mac-tracking {[add|delete]} ports [port_list|all]
```

Description

Enables or disables MAC address tracking for all MAC addresses on the specified ports.

Syntax Description

add	Enables MAC address tracking for the specified ports.
delete	Disables MAC address tracking for the specified ports.
port_list	Specifies a list of ports on which MAC address tracking is to be enabled or disabled.
all	Specifies that MAC address tracking is to be enabled or disabled on all ports.

Default

No ports are enabled for MAC address tracking.

Usage Guidelines

MAC address tracking events on enabled ports generate EMS messages and can optionally generate *SNMP* traps.

Note

When a MAC address is configured in the tracking table, but detected on a MAC tracking enabled port, the per MAC address statistical counters are not updated.

Example

The following example enables MAC address tracking for all MAC addresses on port 2:1:

```
configure fdb mac-tracking add ports 2:1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fdb static-mac-move packets

```
configure fdb static-mac-move packets count
```

Description

Configures the number of EMS and *SNMP* reports that can be generated each second for MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

count	Specifies the number of duplicate MAC address events that are reported each second. The range is 1 to 25.

Default

2.

Usage Guidelines

None.

Example

The following example configures the switch to report up to five duplicate MAC address events per second:

```
# configure fdb static-mac-move packets 5
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure fdb vlan vxlan

```
configure fdb { mac_addr | broadcast | unknown-unicast | unknown-
   multicast } vlan vlan_name [ add | delete ] vxlan { vr vr_name }
   {ipaddress} remote_ipaddress
```

Description

This command allows you to add or remove remote VTEPs to a MAC address.

Syntax Description

mac_addr	Forwarding destination(s) for this MAC.
broadcast	Forwarding destination(s) for broadcast traffic.
unknown-unicast	Forwarding destination(s) for unknown unicast traffic.
unknown-multicast	Forwarding destination(s) for unknown multicast traffic.
add	Add to configuration.
delete	Delete from configuration.
vr	VR/VRF instance the IPv4 address is configured on.
vr_name	An existing VR/VRF name.
ipaddress	Configure the IP address of the remote tunnel endpoint to which the MAC needs to be bound.
remote_ipaddress	IPv4 address of the remote tunnel endpoint.

Default

VR-Default.

Usage Guidelines

You must first use the `[create | delete] fdb` command to add the first remote VTEP, and then issue this command to add additional remote VTEPs for the same MAC. You cannot add a remote VTEP to a static entry that has ports or blackhole configured. When the last VTEP is deleted, ExtremeXOS deletes the *FDB* entry for that MAC.

Example

```
# configure fdb 01:00:5e:00:00:01 vlan vlan101 add vxlan ipaddress 30.30.30.1
# configure fdb broadcast vlan vlan101 add vxlan vr VR-Default ipaddress 30.30.30.1
# configure fdb unknown-unicast vlan vlan101 delete vxlan ipaddress 20.20.20.1
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is supported on the ExtremeSwitching 5320, 5420, 5520, 5720 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure flow-redirect add nexthop

`configure flow-redirect` *`flow_redirect_name`* **`add nexthop`** *`ipaddress`*
`priority` *`number`*

Description

Adds a nexthop for the named flow redirection policy.

Syntax Description

`flow_redirect_name`	Specifies the name of the flow redirection policy.
`ipaddress`	Specifies the IPv4 or IPv6 address of a new nexthop.
`number`	Specifies the priority value for the nexthop.

Default

N/A.

Usage Guidelines

Use this command to add a new nexthop for the named flow redirection policy. You can specify an IPv4 address or an IPv6 unicast IP address (IPv6 multicast addresses are not supported). After you enter an IP address, the redirection policy only accepts addresses from the same family as the first address specified. For example, if the first IP address added is an IPv6 unicast address, you cannot add an IPv4 address to the policy.

The priority value can range from a low of 1 to a high of 4096. The nexthop with the highest priority among multiple ones is preferred as the working nexthop. When each added nexthop has the same priority, the first one configured is preferred.

Example

The following example adds a nexthop 10.1.1.1 for the flow redirection policy flow10 with a priority of 100:

```
configure flow-redirect flow10 add nexthop 10.1.1.1 priority 100.
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

The maximum number of flow redirects was increased to 4096 in ExtremeXOS 16.1.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure flow-redirect delete nexthop

```
configure flow-redirect flow_redirect_name delete nexthop {ipaddress |
   all }
```

Description

Deletes a single or all nexthops for the named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ipaddress	Specifies the IPv4 or IPv6 address of the nexthop.
all	Specifies that all configured nexthps are to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete a nexthop for the named flow redirection policy. If the deleted nexthop is the working nexthop for the policy-based routing entry, another is selected from the remaining active next hops, based on priority.

Example

The following command deletes the nexthop 10.1.1.1 from the flow redirection policy flow10:

```
configure flow-redirect flow10 delete nexthop 10.1.1.1
```

The following command deletes all configured nexthop's from the flow redirection policy exflow:

```
configure flow-redirect exflow delete nexthop all
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure flow-redirect health-check

```
configure flow-redirect flow_redirect_name health-check [ping | arp |
   neighbor-discovery]
```

Description

Configures health checking for a specific flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ping	Specifies ping health checking.
arp	Specifies ARP health checking for IPv4.
neighbor-discovery	Specifies Neighbor Discovery health checking for IPv6.

Default

Ping is the default.

Usage Guidelines

Use this command to configure health checking for a specific named flow redirection policy.

Example

The following command specifies arp health checking for the flow redirection policy flow10:

```
# configure flow-redirect flow10 health-check arp
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure flow-redirect nexthop

```
configure flow-redirect flow_redirect_name nexthop ip_address ping
   health-check interval seconds miss number {success successes}
```

Description

Configures the ping interval, miss count, and success for a nexthop in the flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ip_address	Specifies the IPv4 or IPv6 address of the nexthop.
seconds	Specifies the number of seconds between pings. The default is “2”.
number	Specifies the number of misses allowed. The default is “2”.
success	Specifies a number of consecutive ping successes required to declare that a nexthop is up.
successes	Sets the value for the number of consecutive successful pings to declare that a nexthop is up. Range is 1 to 256. The default is 4.

Default

The default for ping interval is 2 seconds.

The default for number of misses is 2.

The default for number of successes is 4.

Usage Guidelines

Use this command to set a ping interval, miss count, and ping success. When the ping response is not received within the interval seconds * (number +1), the nexthop is considered to be dead and a new candidate is selected from the remaining active nexthops.

Example

The following command configures a ping interval of 3 seconds, miss count of 3, and success count of 3 for the nexthop 10.1.1.1 in the flow redirection policy flow 3:

```
# configure flow-redirect flow3 nexthop 10.1.1.1 ping health-check interval 3 miss 3
success 3
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

The **success** option was added in ExtremeXOS 22.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure flow-redirect no-active

`configure flow-redirect` *flow_redirect_name* **no-active** [**drop**|**forward**]

Description

Configures packets to either follow the normal routing table or be dropped.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
drop	Specifies that the packets are to be dropped.
forward	Specifies that the packets are to follow the normal routing table.

Default

The default is forward.

Usage Guidelines

Use this command to set a drop or forward configuration for packets to be applied when all configured next hops become unreachable.

Example

The following command configures packets of the flow redirection policy flow3 to be dropped when all configured next hops become unreachable:

```
configure flow-redirect flow3 no-active drop
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure flow-redirect vr

`configure flow-redirect` *`flow_redirect_name`* **`vr`** *`vr_name`*

Description

Configures a virtual router for a flow redirection policy.

Syntax Description

`flow_redirect_name`	Specifies the name of the flow redirection policy.
`vr_name`	Specifies the name of the virtual router.

Default

The default virtual router is *VR-Default*.

Usage Guidelines

Because ACLs do not recognize the virtual router concept, one policy-based routing can be used for multiple virtual routing entries when a *VLAN*-based virtual router is used for one port. This configuration of a VR into a flow-redirect makes a policy-based routing work for a specific VR.

Example

The following command configures virtual router mgmt for flow redirection policy flow3:

```
configure flow-redirect flow3 vr mgmt
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

NEW! configure flowmon collector

```
configure flowmon collector collector_name
```

Description

Configures a created collector where Flow Monitor sends information.

Syntax Description

collector	Specifies to send flow information to a collector.
collector_name	Specifies the name of the created collector. Range is 32 characters.

Default

N/A.

Usage Guidelines

You must configure*src-ipv4-address*, which is a dotted decimal representation of the local address. If not configured, the collector cannot be activated.

You must configure *dst-ipv4-address*, which is a dotted decimal representation of the IPv4 address of a collector. If not configured, the collector cannot be activated.

Optional configuration parameters include the following:

- *src-udp-port* is the source port number used in the UDP header. If not specified, the switch will assign a port number.
- *dst-udp-port* is the destination port number used in the UDP header. The default value is 4,739.
- *vr-name* is the name of the virtual router used to route to the collector.
- *export-mtu* is the maximum size of a template or an IPFIX report. Default is 512 bytes, range is 512 <= <export-mtu> <= 9,216.
- *refresh-time* is the time between sends to the collector of template data in seconds (default value is 600 seconds). Minimum value is 60 seconds. This value must be coordinated with the collector by the user.

Example

The following command configures a created collector with no additional parameters:

```
# configure flowmon collector ctest dst-ipv4-address 21.1.1.100  src-ipv4-address 21.1.1.1
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! configure flowmon group

```
configure flowmon group group_name
```

Description

Configures a created group where Flow Monitor sends information.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.

Default

N/A.

Usage Guidelines

Optional configuration parameters include the following:

- *max-flow-age* is the maximum age of any flow related to the group in milliseconds. The minimum value is 100ms. The default value is 60,000ms (one minute), and the maximum value is 4294967295ms (a 32-bit unsigned integer). Flow aging cannot be disabled.
- *limit* is the maximum number of flows allowed in the flow database for this group. The minimum value is 32 and the maximum value is the maximum number of flows for the switch type.
- *k-mirror* specifies the *mirror_name*. If *flow-class-id* is specified, then *k-mirror* cannot be specified. The user can clear the k-mirror using the **none** option. Traffic is mirrored to the same collector assigned to the group.
- *flow-class-id_value* is a user-assigned number between 5 and 255. If *k-mirror* is specified, then this value cannot be specified. The user can clear the value by using the **none** option.

Example

The following command configures the Flow Monitor group with the name 'src-ipv4-address':

```
# configure flowmon group src-ipv4-address
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! configure flowmon group collector

```
configure flowmon group group_name [add | delete] collector
   collector_name
```

Description

Configures a relationship between a Flow Monitor collector and a group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.
add	Specifies to add a collector to a group.
delete	Specifies to delete a collector from a group.
collector	Specifies to the collector.
collector_name	Specifies the name of the created collector. Range is 32 characters.

Default

N/A.

Usage Guidelines

Only one collector can be added to a group, but the same collector can be added to multiple groups.

The system will reject any attempt to add a collector to a group that already contains a collector.

The system will also reject any attempt to delete a collector from a group that was not previously added to the group.

Example

The following command adds a collector with the name 'src-ipv4-address' to the group with the name 'max-flow-age':

```
# configure flowmon group max-flow-age add collector src-ipv4-address
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! configure flowmon group key

```
configure flowmon group group_name [add | delete] key key_name
```

Description

Configures a relationship between a Flow Monitor key and a group.

Syntax Description

group	Specifies the Flow Monitor group.
group_name	Specifies the assigned name of the Flow Monitor group. Range is 32 characters.
add	Specifies to add a key to a group.
delete	Specifies to delete a collector from a group.
key	Specifies the key.
key_name	Specifies the name of the created key. Range is 32 characters.

Default

N/A.

Usage Guidelines

While a key is being added to a group, the key can't be modified.

Flow Monitor creates a template key portion that matches the key. Flow Monitor then searches for a match to see if that template key portion has already been created. If not, Flow Monitor saves the new template key portion and relates it to the group. If the key has already been created, Flow Monitor checks the group to see if that template key portion is already related to the group. If a different

template key portion is related to the group, then the **add** fails. If not, the template key portion (either newly created or pre-existing) is related to the key.

If the group is already enabled, the key is installed in the hardware. Keys can be added to or deleted from a group regardless of the state of the group.

When a key is to be deleted from a group, the key is disassociated from the key template portion. The key is then disassociated from the group. If the group has no more keys associated with it and the group is disabled, the group is then disassociated from the template key portion.

Example

The following command adds a key with the name 'src-ipv4-address' to the group with the name 'max-flow-age':

```
# configure flowmon group max-flow-age add key src-ipv4-address
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW!

configure flowmon key ipv4

`configure flowmon` **`key`** *`key_name`* **`ipv4`**

Description

Configures a Flow Monitor key with IPv4 parameters.

Syntax Description

key	Specifies the Flow Monitor key.
key_name	Specifies the name of the key being configured with parameters. Range is 32 characters.

Default

N/A.

Usage Guidelines

Optional configuration parameters include the following:

- *src-ipv4-addr* is a source IPv4 subnetwork address given in dotted decimal notation format.
- *src-ipv4-mask* is a source IPv4 subnetwork mask value given in dotted decimal notation format.
- *dst-ipv4-addr* is a destination IPv4 subnetwork address given in dotted decimal notation format.
- *dst-ipv4-mask* is a destination IPv4 subnetwork mask value given in dotted decimal notation format.
- *port_no* is either a source or destination TCP or UDP port number.
- *protocol* is the protocol field value carried in IPv4 packets.
- *next_header* is the protocol field value carried in IPv6 packets.
- *port-list* is a list of ports given in standard CLI format, fore example, 1:1-48, 3:5, and 4:6 represent ports 1 through 48 on slot 1, port 5 on slot 3, and port 6 on slot 4, respectively. Flows otherwise matching the key received on any other port will not generate a group assignment. If **all** (the default value) is specified or the *port-list* option is omitted, then the key will be installed on all available user ports that support Flow Monitor, including on any new hardware inserted into the stack.
- *key_name_other* is used with either the **before** or **after** keyword. It specifies the name of a different key from the one being configured. **before** implies that the configuring key will be higher priority than the other key, and **after** indicates that the other key will be higher priority than the one being configured. The insertion is immediately before or after the other key regardless of other keys that have been configured.

If a specific port list indicates a slot where Flow Monitor is not supported, the command will be rejected.

Example

The following command creates a key named 'k1' with no additional IPv4 parameters:

```
# configure flowmon key k1 ipv4'
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

NEW! configure flowmon key ipv6

```
configure flowmon key key_name ipv6
```

Description

Configures a Flow Monitor key with IPv6 parameters.

Syntax Description

key	Specifies the Flow Monitor key.
key_name	Specifies the name of the key being configured with parameters. Range is 32 characters.

Default

N/A.

Usage Guidelines

Optional configuration parameters include the following:

- *src-ipv6-addr* is a source IPv4 subnetwork address given in dotted decimal notation format.
- *src-ipv6-mask* is a source IPv4 subnetwork mask value given in dotted decimal notation format.
- *dst-ipv6-addr* is a destination IPv4 subnetwork address given in dotted decimal notation format.
- *dst-ipv6-mask* is a destination IPv4 subnetwork mask value given in dotted decimal notation format.
- *port_no* is either a source or destination TCP or UDP port number.
- *protocol* is the protocol field value carried in IPv4 packets.
- *next_header* is the protocol field value carried in IPv6 packets.
- *port-list* is a list of ports given in standard CLI format, fore example, 1:1-48, 3:5, and 4:6 represent ports 1 through 48 on slot 1, port 5 on slot 3, and port 6 on slot 4, respectively. Flows otherwise matching the key received on any other port will not generate a group assignment. If **all** (the default value) is specified or the *port-list* option is omitted, then the key will be installed on all available user ports that support Flow Monitor, including on any new hardware inserted into the stack.
- *key_name_other* is used with either the **before** or **after** keyword. It specifies the name of a different key from the one being configured. **before** implies that the configuring key will be higher priority than the other key, and **after** indicates that the other key will be higher priority than the one being configured. The insertion is immediately before or after the other key regardless of other keys that have been configured.

If a specific port list indicates a slot where Flow Monitor is not supported, the command will be rejected.

Example

The following command creates a key named 'k2' with no additional IPv6 parameters:

```
# configure flowmon key k2 ipv6
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5420 series switches.

configure forwarding internal-tables

```
configure forwarding internal-tables [ 12-and-13 | more [12 | 13-and-
   ipmc | routes {ipv6-mask-length [64 | 128]}]]
```

Description

Customizes the internal hardware forwarding tables based on the customer's network requirements.

Syntax Description

forwarding	Configure settings for hardware forwarding.
internal-tables	Configure settings for internal lookup tables.
12-and-13	Program the internal lookup tables for layer-2 MAC *FDB* and layer-3 hosts and IP multicast (default).
more	Configure the internal lookup tables for additional entries of specified types.
12	Program the internal lookup tables for additional layer-2 MAC FDB entries.
13-and-ipmc	Program the internal lookup tables for additional layer-3 hosts and IP multicast.
routes	Programs the internal lookup tables for additional IPv4 routes and IPv6 routes (mask 0–64) using Algorithmic Longest-Prefix Match (ALPM). This option is only available on the ExtremeSwitching 5520 series switch or stack.
ipv6-mask-length	Optimizes ALPM route capacity by choosing the maximum number of bits in the IPv6 route subnet mask length.
64	Maximizes IPv4 route capacity (default). IPv6 routes mask length: • 0–64 bits use ALPM hardware • 65–128 use ACL hardware without route sharing
128	Maximizes IPv6 route capacity for mask length 65–128 bits. All routes use ALPM hardware with route sharing.

Default

For internal tables: **12-and-13**.

For IPv6 mask length: **64**.

Usage Guidelines

Use this command to customize the internal hardware forwarding tables based on the customer's network requirements.

The ExtremeSwitching 5520 has hardware forwarding tables internal to the switch chips that can be partitioned in a flexible manner.

To display the current configuration, use the `show forwarding configuration` command.

Example

By default, the internal tables have L2 and L3 capacity whose relative size is similar to existing products. The default is:

```
# configure forwarding internal-tables l2-and-l3
```

There are three other choices. You can elect to have more L2 hardware table entries:

```
# configure forwarding internal-tables more l2
```

Or, you can choose to have more L3 unicast and multicast entries:

```
# configure forwarding internal-tables more l3-and-ipmc
```

The following example configures the switch to use ALPM to increase IPv4 and IPv6 route scaling:

```
# configure forwarding internal-tables more routes
```

The current and configured values are shown in the output of the show command:

```
# show forwarding configuration

L2 and L3 Forwarding table hash algorithm:
    Configured hash algorithm:              crc32
    Current hash algorithm:                 crc32

L3 Dual-Hash configuration:
    Configured setting:                     on
    Current setting:                        on
    Dual-Hash Recursion Level:              1

Hash criteria for IP unicast traffic for L2 load sharing and ECMP route sharing
    Sharing criteria:                       L3_L4

IP multicast:
    Group Table Compression:                on
    Local Network Forwarding:               slow-path
    Lookup-Key:                             (SourceIP, GroupIP, VlanId)

Internal lookup tables:
    Configured Setting:                     more l2
    Current Setting:                        l2-and-l3
NOTE: A save and reboot are required before the configured setting will take effect.

Switch Settings:
    Switching mode:                         store-and-forward

L2 Protocol:
    Fast convergence:                       on

Rate Limit:
```

```
    Overhead Bytes:                         20

Fabric Flow Control:
    Fabric Flow Control:                    auto
ARP and ND Settings:
    ARP Suppression Filters:                per-port
    ND Suppression Filters:                 per-port
```

History

This command was first available in ExtremeXOS 15.4.

The **routes** option was added in ExtremeXOS 22.2.

The **ipv6-mask-length** option was added in ExtremeXOS 22.5.

Platform Availability

ExtremeSwitching 5520 (standalone or in a stack).

configure forwarding flow-control fabric

```
configure forwarding flow-control fabric [auto | off]
```

Description

Allows the fabric configuration to be turned off.

Syntax Description

auto	Automatically configures fabric flow control based on the priority flow control RX configuration.
off	Unconfigures the fabric flow control.

Default

Auto.

Usage Guidelines

Use this command to turn off fabric configuration or return it to the default auto mode.

Example

The following command turns off the fabric configuration:

```
configure forwarding flow-control fabric off
```

The following command returns fabric configuration to the auto mode:

```
configure forwarding flow-control fabric auto
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding hash-algorithm

```
configure forwarding hash-algorithm [crc16 | crc32]
```

Description

Modifies hardware table utilization by configuring the hash algorithm or dual-hash settings.

Syntax Description

crc16	Specifies the CRC16 hash algorithm.
crc32	Specifies the CRC32 hash algorithm. This is the default setting.

Default

In ExtremeXOS 11.5, the default hash algorithm is crc32.

In ExtremeXOS 11.4 and earlier, the default hash algorithm is crc16.

Usage Guidelines

Note
Modify the hardware table hash algorithm only with the guidance of Extreme Networks technical personnel.

The switch uses a hash algorithm to decide where to store the addresses in the hardware table. The standard, default hash algorithm works well for most systems; however, for some addresses with certain patterns, the hardware may attempt to store address information in the same section of the hardware.

If you are running ExtremeXOS 11.4 or earlier and experience a full hardware table that affects Layer 2, IP local host, and IP multicast forwarding, you see messages similar to the following in the log:

```
 <Info:HAL.IPv4Adj.Info> : adj 136.159.188.109: IP add error is Table full for new or
newly resolved ARP, egress valid <Info:HAL.IPv4Adj.Info> : adj 136.159.188.109: returned
-17 for L3 table bucket 181 <Warn:HAL.IPv4Mc.Warning> : Could not allocate a hardware
S,G,V entry (889f4648,effffffa,70) - hardware table resource exceeded (rv=-17).
```

If you are running ExtremeXOS 11.5 or later and experience a full hardware table that affects Layer 2, IP local host, and IP multicast forwarding, you see messages similar to the following in the log:

```
<HAL.IPv4Adj.L3TblFull> MSM-A: IPv4 unicast entry not added. Hardware L3 Table full.
```

In the previously described situations, you can configure a different hash algorithm to select a different section of the hardware to store addresses. You must save your configuration and reboot the switch to modify the hash algorithm used by the hardware table. Typically, the dual-hash feature improves hash utilization. You must save your configuration and reboot the switch to turn dual-hash on or off.

Upgrading to ExtremeXOS 11.5

When you upgrade to ExtremeXOS 11.5, the hash algorithm automatically becomes crc32. For example, if you saved a configuration using an image from ExtremeXOS 11.4 or earlier with the hash algorithm set to crc16, when ExtremeXOS 11.5 loads, the hash algorithm becomes crc32. To change the hash algorithm to crc16, use the `configure forwarding hash-algorithm` crc16 and save your switch configuration.

Example

The following example modifies the hardware table hash algorithm to crc16:

```
configure forwarding hash-algorithm crc16
```

The switch displays the following message to describe the change and to prompt you to save your configuration and reboot the switch:

```
Configured hash alorithm has been changed to 'crc16' with L3 dual-hash support 'on' for
applicable HW.
Warning:  This command will only take effect after a save and reboot
```

The switch displays the following message:

```
Configured hash algorithm has been changed to 'crc32' with L3 dual-hash support 'off' for
applicable HW.
Warning: This command will only take effect after a save and reboot.
```

To display the results, use the `show forwarding configuration` command.

History

This command was first available in ExtremeXOS 11.3.2.

The default hash algorithm was changed to crc32 in ExtremeXOS 11.5.

Platform Availability

This command is available only on all platforms.

configure forwarding hash-recursion-level

```
configure forwarding hash-recursion-level 0-3
```

Description

Modifies hardware table utilization by configuring the dual hashing recursion level.

Syntax Description

0–3	Sets the maximum number of L3 hash buckets to modify to make room for a new entry.

Default

The default is “1.”

Usage Guidelines

This command allows you to select the dual hashing “recursion level” for hardware with the dual-hash feature. The setting applies only if dual-hash is configured or defaulted to “on” using the configure forwarding hash-algorithm command.

The configured recursion level is the maximum number of existing hash entries to move in an attempt to add a new hash entry. A higher recursion level may provide better hash utilization at the expense of additional CPU processing. This command does not require a system reboot. However, the new recursion level takes effect only for addresses added after the command is issued.

Example

The following command modifies the dual-hash recursion level to modify up to two L3 hash buckets in an attempt to add a new entry:

```
configure forwarding hash-recursion-level 2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure forwarding ipmc all

```
configure forwarding ipmc all [flood | learn]
```

Description

Enables you to forward packets for the mDNS, LLMNR, and UPnP protocols to the VLAN for learning.

Syntax Description

flood	Specifies to forward all (mDNS, LLMNR, and UPnP) to VLAN. (Default).
learn	Specifies to send all (mDNS, LLMNR, and UPnP) to the CPU for learning.

Default

flood

Usage Guidelines

Use this command to enable mDNS, LLMNR, and UPnP for flood or learn state.

When **flood** to VLAN is enabled, an ACL filter is installed, and one ACL entry is consumed for each of the three protocols.

When in **learn** mode, no ACL filters are installed, and no ACL resources are consumed.

Use the **llmnr**, **mdns**, and **upnp** keywords to specify separate protocols.

Example

The following command enables all three protocols to flood to VLAN:

```
configure forwarding ipmc all flood
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding ipmc compression

```
configure forwarding ipmc compression {group-table | off}
```

Description

Enables or disables compression of entries in the IP multicast group table to facilitate improved IP multicast scaling.

Syntax Description

group-table	Enables compression.
off	Disables compression.

Default

group-table.

Usage Guidelines

Compression of IP multicast group table entries allows the switch to process more multicast traffic using the faster switch hardware instead of the relatively slower switch software. Compression requires additional processing. Disable this feature if you suspect a problem exposed by IP multicast compression.

When you enable or disable this feature, all IP multicast entries are flushed, and this can result in a temporary loss of multicast traffic while the IP multicast entries are relearned.

To display the compression feature configuration, enter the command:

```
show forwarding configuration
```

Example

The following command disables compression:

```
configure forwarding ipmc compression off
```

History

This command was first available in ExtremeXOS 12.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure forwarding ipmc llmnr

```
configure forwarding ipmc llmnr [flood | learn]
```

Description

Enables you to forward packets for the LLMNR protocol to the VLAN for learning.

Syntax Description

flood	Specifies to forward LLMNR to VLAN. (Default).
learn	Specifies to send LLMNR to the CPU for learning.

Default

flood

Usage Guidelines

Use this command to enable LLMNR to a flood or learn state.

When **flood** to VLAN is enabled, an actual ACL filter is installed, and one ACL entry is consumed.

When in **learn** mode, no ACL filters are installed, and no ACL resources are consumed.

Example

The following command enables LLMNR to flood to VLAN:

```
configure forwarding ipmc llmnr flood
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding ipmc local-network-range

`configure forwarding ipmc` **local-network-range** [**fast-path** | **slow-path**]

Description

Sets how forwarding of packets to local network IP multicast addresses (224.0.0.x) is handled.

Syntax Description

fast-path	Specifies fast-path forwarding. Fast-path forwarding dictates that packets traversing the switch do not require processing by the CPU. Fast path packets are forwarded entirely by ASICs and are sent at wire speed rate. This consumes additional system *ACL* per-port or per-*VLAN*, depending on `configure igmp snooping filters` [**per-port** | **per-vlan**] selections.
slow-path	Specifies slow-path forwarding (default). Packets are processed by the CPU.

Default

Slow-path forwarding is the default configuration.

Example

The following example sets up fast-path forwarding for local network IP multicast addresses:

```
configure forwarding ipmc local-network-range fast-path
```

History

This command was first available in ExtremeXOS 15.3.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding ipmc lookup-key

```
configure forwarding ipmc lookup-key [group-vlan | source-group-vlan |
   mac-vlan | mixed-mode]
```

Description

Enables you to choose the lookup-key for multicast forwarding.

Syntax Description

group-vlan	Specifies that IP multicast forwarding database entries are programmed as (*,GroupIP,VlanId).
source-group-vlan	Specifies that IP multicast forwarding database entries are programmed as (SourceIP, GroupIP, VlanId). (Default).
mac-vlan	Specifies that IP multicast forwarding database entries are programmed as (Mac, VlanId).
mixed-mode	Specifies that IP multicast forwarding database entries are programmed as follows: L3 cache entries (PIM/MVR/PVLAN) use source-group-vlan; L2 cache entries (*IGMP*/MLD/PIM snooping) use mac-vlan.

Default

source-group-vlan.

Usage Guidelines

Use this command to choose the lookup-key for multicast forwarding. The following restrictions apply to this command:

The `configure forwarding ipmc lookup-key mac-vlan` command is disallowed under the following conditions.

- If IPMC forwarding is enabled on at least on one *VLAN*
- If MVR is enabled either globally or on a VLAN

Similarly, enabling the above two features are disallowed,when the ipmc lookup-key is **mac-vlan.** The following warning message is displayed when the **mac-valn** option is specified:

```
Warning:  Usage of multicast IP addresses that could result in overlapping MAC
addresses should be avoided. Example: Using 225.1.1.1, 226.1.1.1 and 225.129.1.1 should
be avoided. Either one of the addresses could be used.  Using multicast with PVLAN
should be avoided with this forwarding option.
```

- Mixed-mode: `configure forwarding ipmc lookup-key mixed-mode`
- The `configure igmp snooping forwarding-mode [group-vlan | source-group-vlan]` command was introduced to support (*, G, V) forwarding before the IPMC compression feature was introduced. Because we are introduced IPv6 multicast support in ExtremeXOS 15.2, this command is deprecated, and the new `configure forwarding ipmc lookup-key` command now covers both IPv4 and IPv6.

The following warning message appears when the mixed mode option is specified:
`Warning: Usage of multicast IP addresses that could result in overlapping MAC addresses should be avoided for snooping (IGMP/MLD/PIM snooping) controlled traffic.`
Example: Using 225.1.1.1, 226.1.1.1 and 225.129.1.1 should be avoided. Either one of the addresses could be used.

Example

The following command specifies that IP multicast forwarding database entries are programmed as (*,GroupIP,VlanId):

```
configure forwarding ipmc lookup-key group-vlan
```

To display the ipmc lookup-key configuration, enter the command:

```
show forwarding configuration
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure forwarding ipmc mdns

`configure forwarding ipmc mdns [flood | learn]`

Description

Enables you to forward packets for the mDNS protocol to the VLAN for learning.

Syntax Description

flood	Specifies to forward mDNS to VLAN. (Default).
learn	Specifies to send mDNS to the CPU for learning.

Default

flood

Usage Guidelines

Use this command to enable mDNS for flood or learn state.

When **flood** to VLAN is enabled, an actual ACL filter is installed, and one ACL entry is consumed.

When in **learn** mode, no ACL filters are installed, and no ACL resources are consumed.

Example

The following command enables mDNS to flood to VLAN:

```
configure forwarding ipmc mdns flood
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure forwarding ipmc upnp

```
configure forwarding ipmc upnp [flood | learn]
```

Description

Enables you to forward packets for the UPnP protocol to the VLAN for learning.

Syntax Description

flood	Specifies to forward UPnP to VLAN. (Default).
learn	Specifies to send UPnP to the CPU for learning.

Default

flood

Usage Guidelines

Use this command to enable UPnP for flood or learn state.

When **flood** to VLAN is enabled, an actual ACL filter is installed, and one ACL entry is consumed.

When in **learn** mode, no ACL filters are installed, and no ACL resources are consumed.

Example

The following command enables UPnP to flood to VLAN:

```
configure forwarding ipmc upnp flood
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding L2-protocol fast-convergence

```
configure forwarding L2-protocol fast-convergence on | off
```

Description

Configures the switch to flooding the unicast traffic during L2 protocol convergence.

Syntax Description

on	Used to avoid flooding the unicast traffic during L2 protocol convergence. (default)
off	Used to Temporarily flooding unicast traffic during L2 protocol convergence.

Default

On.

Usage Guidelines

Use this command to influence the L2-protocol convergence when topology changes in the network to minimize the congestion.

Example

The following command will influence the L2-Protocol control traffic:

```
configure forwarding L2-protocol fast-convergence off
```

History

This command was first available in ExtremeXOS 15.1.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding rate-limit overhead-bytes

`configure forwarding rate-limit overhead-bytes` *`overhead_bytes`*

Description

This command allows you to select the number of overhead bytes that will be included in the rate calculation.

Syntax Description

rate-limit	Rate limiting features.
`overhead_bytes`	Number of overhead bytes used in rate-limit and meter calculations.

Default

20 bytes to include the preamble and inter-frame gap.

Example

The following example displays the output of the show forwarding configuration command with the rate limit information included.

```
L2 and L3 Forwarding table hash algorithm:
    Configured hash algorithm:              crc32
    Current hash algorithm:                 crc32

L3 Dual-Hash configuration:
    Configured setting:                     on
    Current setting:                        on
    Dual-Hash Recursion Level:              1

Hash criteria for IP unicast traffic for L2 load sharing and ECMP route sharing
    Sharing criteria:                       L3_L4

IP multicast:
    Group Table Compression:                on
    Local Network Forwarding:               slow-path
    Lookup-Key:                             (SourceIP, GroupIP, VlanId)
```

```
Internal lookup tables:
    Configured Setting:                     l2-and-l3
    Current Setting:                        l2-and-l3

Switch Settings:
    Switching mode:                         store-and-forward

L2 Protocol:
    Fast convergence:                       on

Rate Limit:
    Overhead Bytes:                         20

Fabric Flow Control:
    Fabric Flow Control:                    auto

ARP and ND Settings:
    ARP Suppression Filters:                per-port
    ND Suppression Filters:                 per-port
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding sharing

```
configure forwarding sharing [L3 | L3_L4]
```

Description

Identifies the fields that are used to select *ECMP* routes and load-sharing group ports.

Syntax Description

L3	Uses only Layer 3 IP addresses to select ECMP routes and load-sharing ports.
L3_L4	Uses Layer 3 IP addresses and Layer4 TCP/UDP port numbers, if present, to select ECMP routes and load-sharing ports.

Default

L3_L4.

Usage Guidelines

This command configures the criteria used to select ECMP routes and load-sharing group ports.

For ECMP routes, the configured criteria selects the next hop gateway. The L3 option uses only the source and destination IP addresses to select the next hop gateway. The L3_L4 option uses the Layer4 TCP or UDP port and the source and destination IP addresses to select the next hop gateway.

For load-sharing groups (link aggregation groups), the configured criteria selects the load-sharing group port. The load-sharing groups can be configured to use the following address-based algorithms:

- L2—Specifies port selection based on Layer 2 information.
- L3—Specifies port selection based on Layer 3 information.
- L3_L4—Specifies port selection based on Layer 3 and Layer4 information.

This command affects all the load-sharing groups that use either the L3 or L3_L4 link aggregation algorithm. If the L3 option is specified, all the load-sharing groups that are configured with either the L3 or the L3_L4 address-based link aggregation algorithm use just the Layer 3 IP addresses for the egress port selection. Similarly if the L3_L4 option is specified, all the load-sharing groups that are configured with either L3 or L3_L4 address-based link aggregation algorithm use the Layer 3 IP addresses and Layer4 port number for the egress port selection.

Selecting the L3 option over L3_L4 can be useful in a network where IP fragments are present, since only the first fragment contains the Layer4 TCP or UDP port number. If the L3 option is selected, all IP fragments in a given TCP or UDP session use the same ECMP gateway or load-sharing group port, potentially avoiding inefficient packet reordering by the destination. If IP fragments are not prevalent, better traffic distribution can be achieved by selecting L3_L4.

To display the forwarding sharing feature configuration, enter the command: `show forwarding configuration`

Example

The following example modifies the sharing selection criteria to use just the Layer 3 IP addresses:

```
configure forwarding sharing L3
```

The following example modified the sharing selection criteria to use the Layer 3 and Layer 4 information:

```
configure forwarding sharing L3_L4
```

History

This command was first available in ExtremeXOS 11.6.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure forwarding suppression filters

`configure forwarding` **`iparp suppression filters`** `[`**`per-port`** `|`**`per-vlan`**`]`

Description

This command controls the way the hardware filters are installed for VXLAN ARP suppression.

Syntax Description

iparp	Selects IP ARP.
suppression	ARP suppression. Requests may be proxied.
filters	Control the way ARP suppression hardware filters are installed.
per-port	Install ARP suppression hardware filters on a per-port basis (default).
per-vlan	Install ARP suppression hardware filters on a per-VLAN basis.

Default

By default, **per-port** option is assumed.

Example

The following example sets IP ARP suppression filtering per-VLAN:

```
configure forwarding iparp suppression filters per-vlan
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is supported on the ExtremeSwitching 5420, 5520 series switches, and stacks with 5320, 5420, 5520, 5720 slots only.

configure forwarding vpex ipmc replication

configure **forwarding vpex ipmc replication** [**controlling-bridge** | **bpe**]

Description

Configures Extended Edge Switching optimized IP multicast replication mode.

Syntax Description

forwarding	Designates configuring hardware capabilities.
vpex	Designates configuring Extended Edge Switching capabilities.
ipmc	Designates configuring IP multicast forwarding settings.
replication	Designates configuring the way hardware replicates IP multicast packets.

controlling-bridge	Sets IP multicast replication to be performed at the controlling bridge (CB) (default).
bpe	Sets IP multicast replication to be performed at the bridge port extender (BPE).

Default

By default, IP multicast replication is done on the CB.

Usage Guidelines

IP multicast (IPMC) replication involves generating multiple copies of incoming IPMC traffic to subscribed receivers. Without IPMC replication, in Extended Edge Switching, if there are “N” receivers on the BPEs , “N” copies are generated by the CB, which is not efficient. IPMC replication allows the CB to send one copy of the packet to the BPE, and then let the BPE do the replication.

You can configure the replication mode with this command. The default replication is at the CB, but you can configure replication at the BPE. You might want to switch to CB-based IPMC replication for debugging in the event of a problem or scalability, because replication on the BPE uses a hardware resource on the CB that is limited.

To see the current IP multicast replication mode, use the command `show forwarding configuration`.

Example

The following example configures the IPMC replication to BPE mode:

```
# configure forwarding vpex ipmc replication bpe
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure forwarding vpex vlan-port-filter

`configure forwarding` **`vpex vlan-port-filter`** [**`hash-table`** | **`port-group`**]

Description

Selects the way VLAN membership is implemented for Extended Edge Switching extended ports.

Syntax Description

vpex	Specifies Extended Edge Switching.
vlan-port-filter	Select hardware mechanism to enforce VLAN port membership.
hash-table	Use hash table for VLAN port membership when different VLANs do not share many ports (default).
port-group	Use port group for VLAN port membership when different VLANs share many ports and there is a requirement for large VLAN scale.

Default

Hash table is the default behavior.

Usage Guidelines

In Extended Edge Switching hardware, the extended ports are represented as virtual ports. The VLAN membership of extended ports can be implemented in two ways:

- Hash table with VLAN and virtual port as key. Note that hash tables can lead to hash collisions at higher scale. (Default)
- Virtual port group. Programming the same group number in the VLAN table and virtual port table indicates membership. The hardware has 64 virtual port groups. You should select this option if many VLANs share the same extended ports.

Note that changing this configuration at run time could result in temporary loss of traffic while the tables are reprogrammed. It is preferable to identify which option works best for the particular topology and leave the setting unchanged during runt ime or schedule the change during a maintenance window.

To see what setting you have selected with this command, see show forwarding configuration on page 2664.

Example

The following example selects a virtual port group to define VLAN membership:

```
# configure forwarding vpex vlan-port-filter port-group
```

History

This command was first available in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure identity-management role

```
configure identity-management role role_name { tag [ tag | none] } {vr
   vr_name | none ] }
```

Description

This command defines *VLAN*/VR membership to an identity management role.

Syntax Description

role_name	Name of the role.
tag	VLAN tag for dynamic VLAN creation for this role.
tag	VLAN tag between 1 and 4094.
vr	Virtual router name for dynamic VLAN creation for this role.
vr_name	Virtual router name.
none	None.

Default

N/A.

Usage Guidelines

Use this command to configure VLAN tag and the VR in which the dynamic VLAN has to be created for a role. By default the dynamic VLAN is created in *VR-Default* if the VR is not configured. The identity is placed in the base VLAN if no VLAN tag is configured for this role. The configured VLAN tag and VR can be set to none to unconfigure the same. *VR-Mgmt* is not allowed to configure. The VLAN tag and VR is applicable only to the user created roles.

Example

The following example configures role "r1" and tag 100:

```
# configure identity-management role "r1" tag 100 vr "VR-Default"
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role-based-vlan

```
configure identity-management role-based-vlan [add | delete] ports
   [port_list | all]
```

Description

This command defines

Syntax Description

role-based vlan	Associates the identity to a specific *VLAN* based on the identity's role.
add	Adds ports to the Identity Management role-based vlan enabled portlist.
delete	Deletes ports from the Identity Management role-based vlan enabled portlist.
ports	Configures Identity Management role-based VLAN on ports.
port_list	Configures Identity Management role-based VLAN on specified port list.
all	Configures Identity Management role-based VLAN on all ports.

Default

N/A.

Usage Guidelines

Use this command to configure the role-based VLAN feature for Identity Management enabled ports. This command requires the ports to be part of a base VLAN. Enabling role-based VLAN on Identity Management enabled ports allows the identity to be placed in the correct VLAN mapped to the role as configured by the administrator.

Note

You cannot enable the Identity Manager role-based VLAN feature on Netlogin enabled ports.

Example

The following example configures Identity Management on ports 1-3, and 5.

```
# configure identity-management role-based-vlan add ports 1-3,5
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management access-list

```
configure identity-management access-list source-address [mac | ip]
```

Description

Configures the access-list source-address type.

Syntax Description

mac	Specifies MAC addresses.
ip	Specifies IP addresses.

Default

MAC addresses.

Usage Guidelines

The identity management feature can install ACLs for identities based on the source MAC or source IP address. By default the MAC address of the identity is used to install the ACLs. Every network entity has a MAC address, but not all network devices have an IP address, so we recommend that you use the default mac selection to install ACLs for network entities based on the source MAC address.

You must disable the identity management feature with the `disable identity-management` command before you use this command.

Example

The following command configures the identity management feature to use MAC-based ACLs:

```
* Switch.4 # configure identity-management access-list source-address mac
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management blacklist

```
configure identity-management blacklist add [mac mac_address {macmask}
   | ip ip_address {netmask} | ipNetmask] | user user_name] configure
   identity-management blacklist delete [all | mac mac_address {macmask}
   | ip ip_address {netmask} | ipNetmask] | user user_name]
```

Description

Adds or deletes an entry in the identity manager blacklist.

Syntax Description

add	Adds the specified identity to the blacklist.
delete	Deletes the specified identity from the blacklist.
all	Specifies that all identities are to be deleted from the blacklist. This option is available only when the delete attribute is specified.
mac_address	Specifies an identity by MAC address.
macmask	Specifies a MAC address mask. For example: FF:FF:FF:00:00:00.
ip_address	Specifies an identity by IP address.
netmask	Specifies a mask for the specified IP address.
ipNetmask	Specifies an IP network mask.
user_name	specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in the blacklist. When you add an identity to the blacklist, the switch searches the whitelist for the same identity. If the identity is already in the whitelist, the switch displays an error.

It is possible to configure an identity in both lists by specifying different attributes in each list. For example, you can add an identity username to the blacklist and add the MAC address for that user's laptop in the whitelist. Because the blacklist has priority over the whitelist, the username is denied access to the switch from all locations.

If you add a new blacklist entry that is qualified by a MAC or IP address, the identity manager does the following:

- Reviews the identities already known to the switch. If the new blacklist entry is an identity known on the switch, all existing ACLs (based on user roles or whitelist configuration) for the identity are removed.
- When a blacklisted MAC-based identity is detected or already known, a Deny All *ACL* is programmed for the identity MAC address for the port on which the identity is detected.
- When a blacklisted IP-based identity is detected or already known, a Deny All ACL is programmed for the identity IP address for the port on which the identity is detected.
- The ACL for blacklisted MAC and IP addresses precedes any ACLs based on user names (including Kerberos snooping) that may have been previously configured on the port. This ensures that a Kerberos exchange cannot complete when initiated for blacklisted identities.

If you add a new blacklist entry that is qualified by a username (with or without a domain name), the identity manager does the following:

- Reviews the identities already known to the switch. If the new blacklist entry is an identity known on the switch, a Deny All ACL is programmed for the identity MAC address on all ports to which the identity is connected.

- When a new blacklisted username-based identity accesses the switch, a Deny All ACL is programmed for the identity MAC address on the port on which the identity was detected.
- The ACL for a blacklisted username follows any ACLs based on Kerberos snooping. This ensures that a Kerberos exchange for another user can complete when initiated from the same MAC address.

Note

Identity manager programs ingress ACLs. Blacklisted devices can receive traffic from the network, but they cannot send traffic into the network.

Deny All ACLs for blacklisted entries exist as long as the identity remains in the identity manager database.

If you delete an identity from the blacklist, identity manager checks to see if the identity is in the local database. If the identity is known to the switch, the switch does the following:

- Removes the Deny All ACL from the port to which the identity connected.
- Initiates the role determination procedure for the switch port to which the known identity connected. This ensures that the appropriate role is applied to the identity that is no longer blacklisted.

Note

The role determination process can trigger an LDAP refresh to collect identity attributes for role determination.

Example

The following command adds a MAC address to the blacklist:

```
* Switch.4 # configure identity-management blacklist add mac 00:01:05:00:03:18
```

The following command deletes a user name from the blacklist:

```
* Switch.5 # configure identity-management blacklist delete user bill_jacob@b.com
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management database memory-size

```
configure identity-management database memory-size Kbytes
```

Description

Configures the maximum amount of memory that is allocated to the identity management database.

Syntax Description

Kbytes	Specifies the maximum amount of memory to be used for maintaining identity information. The range is 64 to 49152 KB.

Default

512 KB.

Usage Guidelines

If the current memory usage is higher than the memory size specified in the configure identity-management database memory-size command, the command is not successful and a warning message appears. The message indicates that the current memory usage level is higher than the configured level and that the memory can be freed only when existing identities log out or disconnect.

Example

The following command allocates 4096 kilobytes to the identity management database:

```
* Switch.4 # configure identity-management database memory-size 4096
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management detection

```
configure identity-management detection [on | off] [fdb | iparp |
   ipsecurity | kerberos | lldp | netlogin | all] ports [port_list |
   all]
```

Description

This command provides the administrator a way to enable/disable the detection of the identities that are triggered through any of the following protocols:

- *FDB*
- IPARP
- IPSecurity *DHCP* Snooping

- *LLDP*
- Netlogin
- Kerberos

Syntax Description

detection	Detection of the identities.
on	Detection of identities on.
off	Detection of identities off.
fdb	FDB identities.
iparp	IPARP identities.
ipsecurity	Identities detected through DHCP snooping entries.
kerberos	Kerberos identities.
lldp	LLDP identities.
all	All identities.

Default

On.

Usage Guidelines

The identity manager detects the identities using the following protocols:

- FDB
- IPARP
- IPSecurity DHCP Snooping
- LLDP
- Netlogin
- Kerberos

By default, Identity Management detects identities through all the above mentioned protocols.

This feature provides the administrator a way to enable/disable the detection of the identities that are triggered through any of the above said protocols. The administrator can control the identity detection through any of the protocol trigger at the port level. This configuration can be applied to identity management enabled ports only. ExtremeXOS displays an error if this configuration is applied for the identity management disabled ports.

Note

All types of Netlogin identity will not be detected if the netlogin detection is disabled.

Enabling Kerberos identity detection will not create identities for the previously authenticated Kerberos clients.

Example

```
* Slot-1 Stack.1 # configure identity-management detection off fdb ports 1:3-6
* Slot-1 Stack.2 # configure identity-management detection off ipsecurity ports 1:3-6
* Slot-1 Stack.3 # configure identity-management detection off kerberos ports 1:1, 2:5-8
* Slot-1 Stack.4 # configure identity-management detection off netlogin ports 1:1-24,
2:1-24
The effect of these commands can be seen by issuing the show identity-management command
* Slot-1 Stack.5 # show identity-management
Identity Management : Enabled
Stale entry age out (effective) : 180 Seconds (180 Seconds)
Max memory size : 512 Kbytes
Enabled ports : 1:1-24, 2:1-24
FDB Detection Disabled ports : 1:3-6
IPARP Detection Disabled ports : None
IPSecurity Detection Disabled ports : 2:1
Kerberos Detection Disabled ports : 1:1, 2:5-8
LLDP Detection Disabled ports : None
Netlogin Detection Disabled ports : 1:1-24, 2:1-24
SNMP trap notification : Enabled
Access list source address type : IP
Kerberos aging time (DD:HH:MM) : 00:08:00
Kerberos force aging time (DD:HH:MM) : None
Valid Kerberos servers : none configured(all valid)
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management greylist

```
configure identity-management greylist add user username identity-
   management greylist delete [all | user username]
```

Description

This command enables a network administrator to choose usernames whose identity is not required to be maintained. These user names are added to greylist. Identity Management module does not create an identity when greylist users log in.

Syntax Description

username	Specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in greylist. Administrator can configure username as part of greylist. When such configuration takes place, identity manager takes following action.

- Checks if the same entry is present in blacklist/whitelist. If yes, command is rejected with appropriate error message.
- Checks if this entry is ineffective because of existing entries in blacklist/whitelist. During this check, precedence of greylist is also taken into account.
  - E.g: New entry being configured into greylist is: Richard@corp. Assume blacklist has higher precedence and it has an entry "Richard". In this case, new entry is ineffective and the configuration is rejected giving the details.
- If no conflict is found, greylist is updated.
- IDM checks if any existing identity matches the new entry in greylist. If match is found, location/identity will be deleted and unknown identity is created with the same MAC.

If greylist user is the only user logged into the device, unknown identity is created and user is kept in unauthenticated role. However if actual user is present along with greylist user, no additional policy is applied for greylist user. Greylist user will get access permissions same as that of actual user logged in.

When user deletes an entry from greylist, identity manager will:

1. Delete the entry and updates the list.

2. User identity is constructed based on *NetLogin* details, if deleted username is found in NetLogin authenticated user database.

Example

The following command adds an username to the greylist:

```
configure identity-management greylist add user Richard@corp
```

The following command deletes an username from the greylist:

```
configure identity-management greylist del user Richard@corp
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management kerberos snooping aging time

`configure identity-management kerberos snooping aging time` *minutes*

Description

Specifies the aging time for Kerberos snooping entries.

Syntax Description

minutes	Specifies the aging time in minutes. The range is 1 to 65535 minutes.

Default

N/A.

Usage Guidelines

Kerberos does not provide any service for un-authentication or logout. Kerberos does provide a ticket lifetime, but that value is encrypted and cannot be detected during snooping.

To enable the aging and removal of snooped Kerberos entries, this timer defines a maximum age for the snooped entry. When a MAC address with a corresponding Kerberos entry in Identity Manager is aged out, the Kerberos snooping timer starts. If the MAC address becomes active before the Kerberos snooping timer expires, the timer is reset and the Kerberos entry remains active. If the MAC address is inactive when the Kerberos snooping timer expires, the Kerberos entry is removed.

Example

The following command configures the aging time for 600 minutes:

```
* Switch.4 # configure identity-management kerberos snooping aging time 600
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management kerberos snooping force-aging time

```
configure identity-management kerberos snooping force-aging time [none |
   minutes]
```

Description

Configures the switch to remove all Kerberos snooping entries after the specified time expires.

Syntax Description

minutes	Specifies the aging time in minutes. The range is 1 to 65535 minutes.
none	Disables the Kerberos force-aging feature.

Default

N/A.

Usage Guidelines

If Kerberos force aging is enabled, we recommend that the Kerberos snooping force aging time be set to the same value as the Kerberos ticket lifetime.

Example

The following command removes all Kerberos snooping entries after 600 minutes:

```
* Switch.4 # configure identity-management kerberos snooping force-aging time 600
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management kerberos snooping forwarding

```
configure identity-management kerberos snooping forwarding [fast-path |
   slow-path]
```

Description

When identity management is enabled on a port, Kerberos packets are software-forwarded. With this command, you can report if shared folder access via identity management-enabled ports is slow if there exists other CPU-bound traffic.

Syntax Description

forwarding	Configure how customer Kerberos authentication packets are forwarded by this system.
fast-path	Forward customer snooped Kerberos packets in hardware (default).
slow-path	Forward customer snooped Kerberos packets in software. This option is recommended only for systems with low CPU-bound traffic.

Default

Fast-path.

Usage Guidelines

Use this command to report if shared folder access via identity management-enabled ports is slow if there exists other CPU-bound traffic.

Example

The following show command displays the modified Kerberos information:

```
# sh identity-management
Identity Management                    : Enabled
Stale entry age out (effective)        : 180 Seconds (180 Seconds)
Max memory size                        : 512 Kbytes
Enabled ports                          : 1
SNMP trap notification                 : Enabled
Access list source address type        : MAC
Kerberos aging time (DD:HH:MM)         : None
Kerberos force aging time (DD:HH:MM)   : None
Kerberos snooping forwarding           : Fast path
Kerberos snooping forwarding           : Slow path
Valid Kerberos servers                 : none configured(all valid)
LDAP Configuration:
-------------------
LDAP Server     : No LDAP Servers configured
Base-DN         : None
Bind credential : anonymous

LDAP Configuration for Netlogin:
  dot1x         : Enabled
  mac           : Enabled
  web-based     : Enabled
```

History

This command was first available in ExtremeXOS 15.1.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management kerberos snooping server

`configure identity-management` **`kerberos snooping add server`** *`ip_address`*

`configure identity-management` **`kerberos snooping delete server`**
`[`*`ip_address`* `|`**`all`**`]`

Description

Adds or deletes a Kerberos server to the Kerberos server list.

Syntax Description

ip_address	Specifies a Kerberos server IP address to add or delete.
all	Specifies that all Kerberos server list entries are to be deleted.

Default

No servers are in the Kerberos server list.

Usage Guidelines

When no servers are configured in the Kerberos server list, the Kerberos snooping feature processes responses from all Kerberos servers, which can expose the system to simulated logins. To avoid this exposure, you can configure a list of up to 20 valid Kerberos servers. When the Kerberos server list contains one or more entries, the switch only processes responses from the Kerberos servers in the list.

Example

The following command adds the Kerberos server at IP address 10.10.10.1 to the Kerberos server list:

```
* Switch.4 # configure identity-management kerberos snooping add server 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management list-precedence

```
configure identity-management list-precedence listname1 listname2
   listname3
```

Description

This command allows you to configure the precedence of list types. You must specify the list-names in the desired order of precedence. Listname1 will take precedence of all lists (i.e., highest precedence). Listname2 will take precedence over Listname3. When the user/device logs in, entries present in Listname1 will be searched at first to find matching role. Entries present in Listname2 will be searched after Listname1 and entries in Listname3 will be searched at last.

Syntax Description

listname1	Specifies the list type which has precedence over all list types.
listname2	Specifies the list type which has next precedence, after listname1.
listname3	Specifies the list type which has least precedence of all.

Default

greylist, blacklist, whitelist

Usage Guidelines

By default, greylist entries have higher precedence over blacklist and whitelist entries.

This means that IDM consults with greylist first upon detection of user, and then decides if identity needs to be created. If there is a greylist entry matching the incoming username, user identity is not created. If there is no matching greylist entry, IDM proceeds with role identification for the user. However, greylist precedence is configurable. Following are three possibilities for greylist precedence configuration.

1. greylist, blacklist, whitelist

2. blacklist, greylist, whitelist

3. blacklist, whitelist, greylist

It is important to notice that blackist always has higher precedence over whitelist for ExtremeXOS 15.1.2. In order to change the list precedence, Identity Management should be disabled first. Disabling IDM is required since there may be many users/devices already mapped to some roles and policies/ACLs applied. Considering the processing load of unmapping the roles and removing policies, changing precedence isn't allowed when IDM is enabled. When precedence configuration is changed, each entry present in the list with lower precedence (new precedence) is checked with each entry present in all the lists with higher precedence.

Example

The following example instructs that blacklist has precedence over all lists. Greylist has precedence over whitelist. Whitelist has least precedence.

```
configure identity-management list-precedence blacklist greylist whitelist
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management ports

```
configure identity-management {add | delete} ports [port_list | all]
```

Description

Adds or deletes identity management for the specified ports.

Syntax Description

add	Enables identity management on the specified port list.
delete	Disables identity management on the specified port list.
port_list	Specifies the ports to which this command applies.
all	Specifies that this command applies to all ports.

Default

No ports are in the identity management enabled port list.

Usage Guidelines

If neither the add nor the delete keyword is entered, identity management is enabled on the specified port list, and the new port list overrides any previous port list.

If identity management is enabled on a port and a user or device is connected to it, information about the user or device is present in the identity management database. If this port is removed from the identity-management enabled port list, the user or device information remains in the data base until the user logs out or the device disconnects. However, once a port is deleted from enabled port list, no new information is added to the identity management database for that port.

Note

Kerberos identities are not detected when both server and client ports are added to identity management.

Example

The following command enables identity management on ports 2:3 and 2:5:

```
configure identity-management add ports 2:3,2:5
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role add child-role

```
configure identity-management role role_name add child-role child_role
```

Description

Adds a child role to the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
child-role	Specifies a name for the new child role (up to 32 characters).

Default

N/A.

Usage Guidelines

The child role name can include up to 32 characters. Role names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. Role names cannot match reserved keywords. For more information on role name requirements and a list of reserved keywords, see Object Names on page 11.

The following guidelines apply to child roles:

- A child role inherits all the policies applied to its parent and any higher levels above the parent.
- The software supports 5 levels of hierarchy.
- Each role can have a maximum of 8 child roles.
- Each child role can have only 1 parent role.

Example

The following example configures a child role named East for the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" add child-role East
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role add dynamic-rule

```
configure identity-management role role_name [add dynamic-rule rule_name
   { first | last | { [before | after] ref_rule_name}}]
```

Description

Adds a dynamic *ACL* rule for the specified role and specifies the order.

Syntax Description

role_name	Specifies the name of an existing role.
rule_name	Specifies the name of a dynamic ACL rule to add to the specified role.

Default

The order of the dynamic rule is last if the order is not explicitly specified.

Usage Guidelines

The maximum number of policies or ACL rules that can be applied to a particular role is restricted to 8. This count does not include the policies and rules inherited from a parent role. Since the maximum hierarchy depth is 5, the maximum number of policies and rules supported for a role at the maximum hierarchy depth is 40 (8 x 5).

When a dynamic ACL rule is added to a role, it is immediately installed for all identities mapped to that role and roles below it in the role hierarchy.

Example

The following example configures the role named India-Engr to use the ACL rule named india-Engr-rule:

```
* Switch.55 # configure identity-management role "India-Engr" add dynamic-rule india-Engr-
rule
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2.1 to specify order.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role add policy

```
configure identity-management role role_name add policy policy-name
   {first | last {[before | after] ref_policy_name}}
```

Description

Adds a policy for the specified role and specifies the order.

Syntax Description

role_name	Specifies the name of an existing role.
policy-name	Specifies the name of a policy to add to the specified role.

Default

The order of the policy is last if the order is not explicitly specified.

Usage Guidelines

The maximum number of policies or *ACL* rules that can be applied to a particular role is restricted to 8. This count does not include the policies and rules inherited from a parent role. Since the maximum hierarchy depth is 5, the maximum number of policies and rules supported for a role at the maximum hierarchy depth is 40 (8 x 5).

When a policy is added to a role, it is immediately installed for all identities mapped to that role and all roles below it in the role hierarchy.

Example

The following example configures the role named India-Engr to use the policy named india-Engr-policy:

```
* Switch.44 # configure identity-management role "India-Engr" add policy india-Engr-policy
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2.1 to specify order.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role delete child-role

```
configure identity-management role role_name delete child-role
   [child_role | all]
```

Description

Deletes one or all child roles from the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
child-role	Specifies a name for a child role to delete.
all	Specifies that all child roles are to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes the child role named East from the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" delete child-role East
```

The following command deletes all child roles from the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" delete child-role all
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role delete dynamic-rule

```
configure identity-management role role_name delete dynamic-rule
   [rule_name | all]
```

Description

Deletes one or all dynamic *ACL* rules for the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
rule_name	Specifies the name of a dynamic ACL rule to delete from the specified role.
all	Specifies that all dynamic ACL rules are to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes all dynamic rules from the role named India-Engr:

```
* Switch.55 # configure identity-management role "India-Engr" delete dynamic-rule all
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role delete policy

```
configure identity-management role role_name delete policy [policy-name
   | all]
```

Description

Deletes one or all policies for the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
policy-name	Specifies the name of a policy to delete from the specified role.
all	Specifies that all policies are to be deleted from the specified role.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes the policy named india-Engr-policy from the role named India-Engr:

```
* Switch.44 # configure identity-management role "India-Engr" delete policy india-Engr-policy
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role match-criteria inheritance

`configure identity-management role match-criteria inheritance [on | off]`

Description

This command enables or disables the match-criteria inheritance support. Check the current status by issuing the `show identity-management` command.

Syntax Description

role	User role.
match-criteria	Match criteria for the role.
inheritance	Inheriting match criteria from parent role to child role.
on | off	Specifies whether match criteria inheritance is on or off.

Default

Off.

Usage Guidelines

From ExtremeXOS Release 15.2, child roles can inherit the match criteria of the parent role. This helps the user since the match criteria need not be duplicated in all levels of hierarchy.

When match-criteria inheritance is on, for a user to be classified under a child role, he has to satisfy the match criteria of the child role, and also all parent roles in the hierarchy.

Match criteria inheritance helps users in avoiding the need to duplicate match-criteria entries in the hierarchy.

Example

For example, there are roles called Employee, USEmployee and USSales in an organization hierarchy of a company XYZCorp.com. Till ExtremeXOS 15.1 (or with match-criteria inheritance off), the user has to create three roles like this:

```
* Switch.1 # create identity-management role Employee match-criteria “company ==
XYZCorp.com;”
* Switch.2 # create identity-management role USEmployee match-criteria “company ==
XYZCorp.com; AND country == USA;”
* Switch.3 # create identity-management role USSales match-criteria “company ==
XYZCorp.com; AND country == USA; AND department = Sales”
* Switch.4 # configure identity-management role "Employee" add child-role "USEmployee"
* Switch.5 # configure identity-management role "USEmployee" add child-role "USSales"
```

Now this can be simplified into the following since child role inherits parent role’s match criteria:

```
* Switch.1 # configure identity-management role match-criteria inheritance on
* Switch.2 # create identity-management role Employee match-criteria “company ==
XYZCorp.com;”
* Switch.3 # create identity-management role USEmployee match-criteria “country == USA;”
* Switch.4 # create identity-management role USSales match-criteria “department = Sales”
* Switch.5 # configure identity-management role "Employee" add child-role "USEmployee"
* Switch.6 # configure identity-management role "USEmployee" add child-role "USSales"
```

History

This command was first available in ExtremeXOS 15.2

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management role priority

```
configure identity-management role role_name priority pri_value
```

Description

Configures a priority value for the specified role.

Syntax Description

role_name	Specifies the name of an existing role that you want to configure.
pri_value	Specifies the role priority; the lower the priority number, the higher the priority. The range of values is 1 to 255. Value 1 represents the highest priority, and value 255 represents the lowest priority.

Default

Priority=255.

Usage Guidelines

The role priority determines which role a user is mapped to when the user's attributes match the match-criteria of more than 1 role. If the user's attributes match multiple roles, the highest priority (lowest priority value) role applies. If the priority is the same for all matching roles, the role for which the priority was most recently set or modified is used.

Example

The following example configures the role named India-Engr to use the highest priority:

```
* Switch.33 # configure identity-management role "India-Engr" priority 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management stale-entry aging-time

`configure identity-management stale-entry aging-time` *seconds*

Description

Configures the stale-entry aging time for event entries in the identity management database.

Syntax Description

seconds	Specifies the period (in seconds) at which event entries are deleted. The range is 60 to 1800 seconds.

Default

180 seconds.

Usage Guidelines

The identity management database contains active entries, which correspond to active users and devices, and event entries, which record identity management events such as user logout or device disconnect. The active entries are automatically removed when a user logs out or a device disconnects. The event entries are automatically removed after a period defined by the stale-entry aging time.

Note

To capture active and event entries before they are deleted, you can use external management software such as Ridgeline™, which can access the switch using XML APIs. We recommend that the external client(s) that poll the identity management database be configured for polling cycles that are between one-third and two-thirds of the stale-aging time. This ensures that a new database entry or event does not age out before the next polling cycle.

The stale-entry aging time defines when event entries become stale. To preserve memory, the software periodically uses a cleanup process to remove the stale entries. You can configure the stale-entry aging time. The cleanup interval is defined by the software.

When memory usage is high, the software reduces both the stale-entry aging time and the cleanup interval to keep memory available for new entries. The following table shows how the database is managed as memory usage increases.

Table 8: Identity Management Database Usage Levels

Database Memory Usage Level	Database Memory Usage Level (Percent)	Effective Stale-Entry Aging Time	Description
Normal	Up to 80%	Configured stale-entry aging time	New identities and associated information (*VLAN* and IP addresses) are added to or updated in the database. Events are also added to the database. Events are deleted from the database after the configured stale-entry aging time.
High	Above 80% to 90%	The lower value of the following: 90 seconds or 50% of the configured stale-entry aging time	Identities and events are added to the database as for the normal usage level, but the effective stale-entry aging time is reduced to delete events sooner and free memory.

Table 8: Identity Management Database Usage Levels (continued)

Database Memory Usage Level	Database Memory Usage Level (Percent)	Effective Stale-Entry Aging Time	Description
Critical	Above 90%	15 seconds	The effective stale-entry aging time is further reduced to delete events sooner and free memory. No new identities are added to the database at this usage level, but updates (such as the addition or deletion of a VLAN or IP address) continue. At this level, the database might be missing active entries.
Maximum	Above 98%	15 seconds	At this level, the software does not process additions or updates to the database. The software only processes deletions. At this level, the database might be missing active entries.

Whenever the database usage level changes, an EMS message is logged, and if enabled, an *SNMP* trap is sent. If the switch changes the stale-entry aging time, the SNMP trap contains the new stale-entry aging time.

Note

If the database level regularly reaches the high usage level, or if it reaches the critical or maximum levels, it is time to investigate the cause of the issue. The solution might be to increase the database memory size.

External clients should be capable of adjusting the polling cycles. Because the aging cycle is shorter when memory is low, it is best if external clients can adjust their polling cycles in response to SNMP traps that announce a change in the stale-entry aging time.

Example

The following command configures the stale-entry aging time for 90 seconds:

```
* Switch.4 # configure identity-management stale-entry aging-time 90
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure identity-management whitelist

```
configure identity-management whitelist add [mac mac_address {macmask}
   | ip ip_address {netmask} | ipNetmask] | user user_name]configure
   identity-management whitelist delete [all | mac mac_address {macmask}
   | ip ip_address {netmask} | ipNetmask] | user user_name]
```

Description

Adds or deletes an identity in the identity manager whitelist.

Syntax Description

add	Adds the specified identity to the whitelist.
delete	Deletes the specified identity from the whitelist.
all	Specifies that all identities are to be deleted from the whitelist. This option is available only when the delete attribute is specified.
mac_address	Specifies an identity by MAC address.
macmask	Specifies a MAC address mask. For example: FF:FF:FF:00:00:00.
ip_address	Specifies an identity by IP address.
netmask	Specifies a mask for the specified IP address.
ipNetmask	Specifies an IP network mask.
user_name	Specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in the whitelist. When you add an identity to the whitelist, the switch searches the blacklist for the same identity. If the identity is already in the blacklist, the switch displays an error.

It is possible to configure an identity in both lists by specifying different attributes in each list. For example, you can add an identity username to the whitelist and add the MAC address for that user's laptop in the blacklist. Because the blacklist has priority over the whitelist, identity access is denied from the user's laptop, but the user can access the switch from other locations.

If you add a new whitelist entry that is qualified by a MAC or IP address, the identity manager does the following:

- Reviews the identities already known to the switch. If the new whitelist entry is blacklisted (by specifying a different identity attribute), no action is taken.
- If the identity is not blacklisted and is known on the switch, all existing *ACL*s for the identity are removed.

- When a whitelisted MAC-based identity is detected or already known, an Allow All ACL is programmed for the identity MAC address for the port on which the identity is detected.
- When a whitelisted IP-based identity is detected or already known, an Allow All ACL is programmed for the identity IP address for the port on which the identity is detected.

If you add a new whitelist entry that is qualified by a username (with or without a domain name), the identity manager does the following:

- Reviews the identities already known to the switch. If the new whitelist entry is an identity known on the switch, an Allow All ACL is programmed for the identity MAC address on all ports to which the identity is connected.
- When a new whitelisted username-based identity accesses the switch, an Allow All ACL is programmed for the identity MAC address on the port on which the identity is detected.
- The ACL for a whitelisted username follows any ACLs based on Kerberos snooping.

Allow All ACLs for whitelisted entries exist as long as the identity remains in the identity manager database.

If you delete an identity from the whitelist, identity manager checks to see if the identity is in the local database. If the identity is known to the switch, the switch does the following:

- Removes the Allow All ACL from the port to which the identity connected.
- Initiates the role determination procedure for the switch port to which the known identity connected. This ensures that the appropriate role is applied to the identity that is no longer whitelisted.

Note

The role determination process can trigger an LDAP refresh to collect identity attributes for role determination.

Example

The following command adds an IP address to the whitelist:

```
* Switch.4 # configure identity-management whitelist add ip 10.0.0.1
```

The following command deletes a user name from the whitelist:

```
* Switch.5 # configure identity-management whitelist delete user john
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure cli idle-timeout

```
configure cli idle-timeout minutes
```

Description

Configures the time-out for idle console, SSH2, and Telnet sessions.

Syntax Description

minutes	Specifies the time-out interval, in minutes. Range is 1 to 240 (1 minute to 4 hours).

Default

The default time-out is 20 minutes.

Usage Guidelines

This command configures the length of time the switch will wait before disconnecting idle console, SSH2, or Telnet sessions.

The idletimeout feature must be enabled for this command to have an effect (the idletimeout feature is enabled by default).

Example

The following command sets the time-out for idle login and console sessions to 10 minutes:

```
configure cli idle-timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

The **cli** keyword was added and the **idletimeout** keyword was changed to **idle-timeout** in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure igmp

```
configure igmp query_interval query_response_interval
   last_member_query_interval {{vlan} vlan_name} {{vr} vr_name}
   {robustness}
```

Description

Configures the *IGMP* timers.

Syntax Description

query_interval	Specifies the interval (in seconds) between general queries.
query_response_interval	Specifies the maximum query response time (in seconds).
last_member_query_interval	Specifies the maximum group-specific query response time (in seconds).
vlan_name	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.
vr_name	Specifies the VR to which the configuration should be applied. If no parameter is specified, the configuration is applied to the current VR context.
robustness	Specifies the degree of robustness for the network.

Default

- query interval—125 seconds
- query response interval—10 seconds
- last member query interval—1 second
- robustness—2

Usage Guidelines

Timers are based on RFC2236. Specify the following:

- query interval—The amount of time, in seconds, the system waits between sending out general queries. The range is 1 to 429,496,729 seconds.
- query response interval—The maximum response time inserted into the periodic general queries. The range is 1 to 25 seconds.
- last member query interval—The maximum response time inserted into a group-specific query sent in response to a leave group message. The range is 1 to 25 seconds.
- robustness—The degree of robustness of the network. The range is 2 to 7. This parameter allows tuning for the expected packet loss on a link. If a link is expected to have packet loss, this parameter can be increased.
- The group timeout is defined by the formula: group_timeout = (query_interval x robustness) + query_response_interval, according to RFC 2236. You can explicitly define the host timeout using the `configure igmp snooping timer router_timeout host_timeout {vr vrname}` command. The effective *host_timeout* is the lesser value of the *group_timeout* and the configured *host_timeout*.

Example

The following command configures the IGMP timers:

```
configure igmp 100 5 1 3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp router-alert receive-required

```
configure igmp router-alert receive-required [on | off] {{vlan}
   vlan_name}
```

Description

Controls when the router-alert option is required for IGMPv2 and IGMPv3 packet reception and processing.

Syntax Description

vlan	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.

Default

Off—All *IGMP* packets are received and processed.

Usage Guidelines

By default, the ExtremeXOS software receives and processes all IGMP packets, regardless of the setting of the router-alert option within a packet. The default configuration works with all switches that support the ExtremeXOS software.

IETF standards require that a router accept and process IGMPv2 and IGMPv3 packets only when the router-alert option is set. The on setting for this command sets the ExtremeXOS software to comply with the IETF standards and should be used when the switch will be used with third-party switches that expect IETF compliant behavior.

Example

The following command configures the switch for IETF compliant IGMP packet processing:

```
configure igmp router-alert receive-required on
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp router-alert transmit

```
configure igmp router-alert transmit [on | off] {{vlan} vlan_name}
```

Description

Controls whether the **router-alert** option is set when forwarding IGMPv2 and IGMPv3 packets.

Syntax Description

vlan	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.

Default

On—The **router-alert** option is set when forwarding IGMPv2 and IGMPv3 packets.

Usage Guidelines

IETF standards require that a router set the **router-alert** option in forwarded IGMPv2 and IGMPv3 packets. The ExtremeXOS software has been updated to comply with this requirement using the default settings.

Earlier versions of the ExtremeXOS software forwarded all *IGMP* packets without setting the **router-alert**option. If compatibility issues arise, you can configure the software to use the legacy behavior by using this command with the **off** option.

Example

The following command configures the switch for IETF compliant IGMP packet processing:

```
configure igmp router-alert transmit on
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping filters

```
configure igmp snooping filters [per-port | per-vlan]
```

Description

Selects the type of *IGMP* snooping filters that are installed.

Syntax Description

per-port	Installs the per-port IGMP snooping filters.
per-vlan	Installs the per-*VLAN* IGMP snooping filters.

Default

per-port.

Usage Guidelines

Use the per-vlan option when the number of VLANs configured on the switch is lower than the maximum numbers listed in the following table. This option conserves usage of the hardware Layer 3 multicast forwarding table.

When the number of configured VLANs is larger than the maximum values listed here, select the per-port option. Each VLAN requires additional interface hardware *ACL* resources. The per-port option conserves usage of the interface hardware ACL resources.

Table 9: Maximum Number of VLANs Supported by per-VLAN IGMP Snooping Filters

ExtremeSwitching Switch Series Module Type	Maximum Number of VLANs When per-VLAN Snooping Filters are Installed
a Series	1000
c Series	2000.
e Series	448.
xl Series	2000.

The actual maximum value is smaller if other processes require entries in the interface ACL table. To display the IGMP snooping filters configuration, use the show igmp snooping command.

Note

For MLD Snooping, the maximum number of VLANs is half of the numbers provided in this table. The maximum number specified here is individual limit for IGMP snooping filters. If both IGMP and MLD snooping filters are used, the maximum numbers are lower than the ones specified.

Example

The following command configures the switch to install the per-VLAN IGMP snooping filters:

```
# configure igmp snooping filters per-vlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping flood-list

```
configure igmp snooping flood-list [policy | none] {vr vrname}
```

Description

Configures certain multicast addresses to be slow path flooded within the *VLAN*.

Syntax Description

policy	Specifies a policy file with a list of multicast addresses to be handled.
none	Specifies no policy file is to be used.
vrname	Specifies a virtual router.

Default

None.

Usage Guidelines

With this command, a user can configure certain multicast addresses to be slow path flooded within the VLAN, which otherwise are fast path forwarded according to *IGMP* and/or Layer 3 multicast protocol.

A policy file is a text file with the extension, .pol. It can be created or edited with any text editor. The specified policy file *policy file* should contain a list of addresses which determine if certain multicast streams are to be treated specially. Typically, if the switch receives a stream with a destination address which is in the *policy file* in 'permit' mode, that stream is software flooded and no hardware entry is installed.

When adding an IP address into the policy file, a 32-bit host address is recommended.

This feature is meant to solve the multicast connectivity problem for unknown destination addresses within system reserved ranges. Specifically this feature was introduced to solve the problem of recognizing certain streams as control packets.

To create a policy file for the snooping flood-list, use the following template:

```
# This is a template for IGMP Snooping Flood-list Policy File
# Add your group addresses between "Start" and "End"
# Do not touch the rest of the file!!!!
entry igmpFlood {
        if match any {
#------------------ Start of group addresses ------------------
        nlri 234.1.1.1/32;
        nlri 239.1.1.1/32;
#------------------- end of group addresses -------------------
                }
        then {
                permit;
        }

        }
entry catch_all {
        if {
        }
        then {
                deny;
        }
}
```

Note
The switch does not validate any IP address in the policy file used in this command. Therefore, slow-path flooding should be used only for streams which are very infrequent, such as control packets. It should not be used for multicast data packets. This option overrides any default mechanism of hardware forwarding (with respect to IGMP, PIM, or DVMRP), so it should be used with caution.

Slow path flooding is done within the L2 VLAN only.

Use the **none** option to effectively disable slow path flooding.

You can use the `show igmp` command to see the configuration of slow path flooding.

Example

The following example configures the multicast data stream specified in access1 for slow path flooding:

```
configure igmp snooping flood-list access1
```

The following command specifies that no policy file is to be used, this effectively disabling slow path flooding:

```
configure igmp snooping flood-list none
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping leave-timeout

```
configure igmp snooping leave-timeout leave_timeout_ms {{vlan}
   vlan_name} {{vr} vr_name}
```

Description

Configures the *IGMP* snooping leave timeout.

Syntax Description

leave_timeout_ms	Specifies an IGMP leave timeout value in milliseconds.
vlan_name	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.

Default

1000 ms.

Usage Guidelines

The leave-timeout is the IGMP leave override interval. If no other hosts override the IGMP leave by the end of this interval, the receiver port is removed.

The range is 0 - 175000 ms (175 seconds). For timeout values of one second or less, you must set the leave-timeout to a multiple– of 100 ms. For values of more than one second, you must set the leave-timeout to a multiple of 1000 ms (one second).

Example

The following example configures the IGMP snooping leave timeout to one second:

```
configure igmp snooping leave-timeout 1000
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping timer

```
configure igmp snooping timer router_timeout host_timeout {vr vrname}
   {vlan vlan_name}
```

Description

Configures the *IGMP* snooping timers.

Syntax Description

router_timeout	Specifies the time in seconds before removing a router snooping entry.
host_timeout	Specifies the time in seconds before removing a host's group snooping entry.
vrname	Specifies a virtual router.
vlan_name	Specifies the *VLAN* name. If no VLAN is specified, the setting is applied to all existing VLANs.

Default

The router timeout default setting is 260 seconds. The host timeout setting is 260 seconds.

Usage Guidelines

Timers should be set to approximately 2.5 times the router query interval in use on the network. Specify the following:

- *router timeout*—The maximum time, in seconds, that a router snooping entry can remain in the IGMP snooping table without receiving a router report. If a report is not received, the entry is deleted. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.
- *host timeout*—The maximum time, in seconds, that a group snooping entry can remain in the IGMP snooping table without receiving a group report. If a report is not received, the entry is deleted. The range is 10 to 214,748,364 seconds. The default setting is 260 seconds.

Note

The *host_timeout* value should be less than or equal to the query timeout value, which is defined by the following: (query_interval x robustness) + query_response_interval.

IGMP snooping expects at least one device on every VLAN to periodically generate IGMP query messages. Without an IGMP querier, the switch eventually stops forwarding IP multicast packets to any port, because the IGMP snooping entries time out, based on the value specified in *host_timeout* or *router_timeout*.

Example

The following example configures the IGMP snooping timers:

```
configure igmp snooping timer 600 600
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports add dynamic group

```
configure igmp snooping {vlan} vlan_name {ports portlist} add dynamic
   group [ grpipaddress ]
```

Description

Configures an *IGMP* dynamic group.

Syntax Description

vlan_name	Specifies a vlan name.
portlist	Specifies a port list.
grpipaddress	Specifies the multicast group IP address.

Default

N/A.

Usage Guidelines

This command adds IGMP groups to specific VLANs or to ports belonging to specific VLANs. After the groups are added, the expiration timer is started. This causes the groups to expire. The configuration is not saved in the configuration file. The following message is displayed on execution of this command:

```
INFO: This command is not saved in the configuration.
```

Example

The following example adds a dynamic group to a switch port:

```
switch.111 # configure igmp snooping vlan "ixia113" ports 47 add dynamic group 225.1.1.1

INFO: This command is not saved in the configuration.
```

The following command displays the group:

```
switch.112 # show igmp group
Group Address     Ver Vlan            Port     Age
225.1.1.1         2   ixia113         47       3

Total: 1
switch.113 #
```

The following example adds a dynamic group to a vlan (loopback port):

```
switch sw5.113 # configure igmp snooping vlan "ixia113" add dynamic group 225.1.1.1

INFO: This command is not saved in the configuration.
```

The following command displays the group:

```
switch.114 # show igmp group
Group Address     Ver Vlan            Port     Age
225.1.1.1         2   ixia113         Lpbk     37

Total: 1
switch.115 #
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports add static group

```
configure igmp snooping {vlan} vlanname {ports portlist }add static
   group grpipaddress
```

Description

Configures *VLAN* ports to receive the traffic from a multicast group, even if no *IGMP* joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.
grpipaddress	Specifies the multicast group IP address.

Default

N/A.

Usage Guidelines

Use this command to forward a particular multicast group to VLAN ports. In effect, this command emulates a host on the port that has joined the multicast group. As long as the port is configured with the static entry, multicast traffic for that multicast group is forwarded to that port.

This command is for IGMPv2 only.

The switch sends proxy IGMP messages in place of those generated by a real host. The proxy messages use the VLAN IP address for source address of the messages. If the VLAN has no IP address assigned, the proxy IGMP message uses 0.0.0.0 as the source IP address.

The multicast group should be in the class-D multicast address space, but should not be in the multicast control subnet range (224.0.0.x/24).

If the ports also have an IGMP filter configured, the filter entries take precedence. IGMP filters are configured using the command:

`configure igmp snooping vlan` *vlanname* **ports** *portlist* **filter***policy file*

Example

The following example configures a static IGMP entry so that multicast group 225.1.1.1 is forwarded to VLAN "marketing" on port 47:

```
switch.30 # configure igmp snooping marketing ports 47 add static group 225.1.1.1
```

The following command displays the group:

```
* (pacman debug) sw4.31 # show igmp group
Group Address     Ver Vlan            Port     Age
225.1.1.1(s)      2   marketing       47       0

Total: 1
switch.32 #
```

The following example adds a static group to a vlan (loopback port):

```
switch.32 # configure igmp snooping marketing add static group 225.1.1.1
```

The following command displays the group:

```
switch.33 # show igmp group
Group Address     Ver Vlan            Port     Age
225.1.1.1(s)      2   marketing       Lpbk     0
```

```
Total: 1
switch.34 #
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports add static router

```
configure igmp snooping {vlan} vlanname ports portlist add static router
```

Description

Configures *VLAN* ports to forward the traffic from all multicast groups, even if no *IGMP* joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Use this command to forward all multicast groups to the specified VLAN ports. In effect, this command emulates a multicast router attached to those ports. As long as the ports are configured with the static entry, all available multicast traffic is forwarded to those ports.

Example

The following example configures a static IGMP entry so all multicast groups are forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 add static router
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports delete static group

```
configure igmp snooping {vlan} vlan_name {ports port_list} delete static
   group [ip_address | all]
```

Description

Removes the port configuration that causes multicast group traffic to be forwarded, even if no *IGMP* leaves have been received on the port.

Syntax Description

vlan_name	Specifies a *VLAN* name.
port_list	Specifies one or more ports or slots and ports.
ip_address	Specifies the multicast group IP address.
all	Delete all the static groups.

Default

N/A.

Usage Guidelines

This command is used to remove a static IGMP group entry created on a VLAN or on a port. Use this command to remove a static group entry created by the following command:

```
configure igmp snooping vlan vlanname ports portlist add static group
ipaddress
```

Example

The following example removes a static IGMP entry that forwards the multicast group 224.34.15.37 to the VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 delete static group 224.34.15.37
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports delete static router

```
configure igmp snooping vlan vlanname ports portlist delete static
   router
```

Description

Removes the configuration that causes *VLAN* ports to forward the traffic from all multicast groups, even if no *IGMP* joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports. On a SummitStack, it can be a list of slots and ports. On a standalone switch, can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

N/A.

Usage Guidelines

This command is used to remove a static router port entry created on a VLAN. Use this command to remove an entry created by the following command:

```
configure igmp snooping vlan vlanname ports portlist add static router
```

Example

The following example removes the static IGMP entry that caused all multicast groups to be forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 delete static router
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports filter

```
configure igmp snooping vlan vlanname ports portlist filter [policy |
   none]
```

Description

Configures an *IGMP* snooping policy file filter on *VLAN* ports.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports. On a SummitStack, it can be a list of slots and ports. On a stand-alone switch, it can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.
policy	Specifies the policy file for the filter.

Default

None.

Usage Guidelines

Use this command to filter multicast groups to the specified VLAN ports.

The policy file used by this command is a text file that contains the class-D addresses of the multicast groups that you wish to block.

To remove IGMP snooping filtering from a port, use the **none** keyword version of the command.

Use the following template to create a snooping filter policy file:

```
# # Add your group addresses between "Start" and "end" # Do not touch the rest of the
file!!!!
entry igmpFilter
{ if match any
{
#------------------ Start of group addresses ------------------
nlri 239.11.0.0/16; nlri 239.10.10.4/32;
#------------------- end of group addresses -------------------
} then { deny;
}
}
entry catch_all
{ if
{
} then
```

```
{ permit;
}
}
```

Example

The following example configures the policy file ap_multicast to filter multicast packets forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 filter ap_multicast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp snooping vlan ports set join-limit

```
configure igmp snooping {vlan} vlanname ports portlist set join-limit
   {num}
```

Description

Configures *VLAN* ports to support a maximum number of *IGMP* joins.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.
num	Specifies the maximum number of joins permitted on the ports. The range is 1 to 500.

Default

No limit.

Usage Guidelines

None.

Example

The following example configures port 2:1 in the Default VLAN to support a maximum of 100 IGMP joins:

```
configure igmp snooping "Default" ports 2:1 set join-limit 100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp ssm-map add

```
configure igmp ssm-map add group_ip [prefix | mask] [source_ip |
   src_domain_name] {vr vr-name}
```

Description

Configures an *IGMP* SSM mapping.

Syntax Description

group_ip	Specifies the multicast IP address for the group mapping.
prefix	Specifies a prefix length for the multicast group IP address. The range is 4 to 32.
mask	Specifies the network mask for the group multicast IP address.
source_ip	The IP address for a multicast group source.
src_domain_name	The source domain name for the multicast group source.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

IGMP SSM mapping operates only with IPv4.

Example

The following example configures an IGMP-SSM mapping for the range of multicast IP addresses at 232.1.1.0/24 originating from IP host 172.16.8.1:

```
configure igmp ssm-map add 232.1.1.0/24 172.16.8.1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure igmp ssm-map delete

```
configure igmp ssm-map delete group_ip {prefix | mask} {source_ip |
   all} vr vr-name
```

Description

Unconfigures an SSM mapping.

Syntax Description

group_ip	Specifies the multicast IP address for the group mapping.
prefix	Specifies a prefix length for the multicast group IP address. The range is 4 to 32.
mask	Specifies the network mask for the group multicast IP address.
source_ip	The IP address for a multicast group source.
all	Specifies that all sources for the specified group or mask are deleted.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes an *IGMP*-SSM mapping for the range of multicast IP addresses at 232.1.1.0/24 originating from IP host 172.16.8.1:

```
configure igmp ssm-map delete 232.1.1.0/24 172.16.8.1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure inline-power classification

```
configure inline-power classification [802.3af | 802.3af-high |
   802.3pre-at | 802.3at | 802.3pre-bt | 802.3bt-type3 | 802.3bt-type4]
   ports port_list
```

Description

This command configures *PoE* port-level classification power-up mode for Extreme Networks PoE devices that do not support 802.3bt when connecting to switches with 60W/90W PoE ports. ExtremeSwitching platforms support per-port basis configuration.

Syntax Description

classification	Classification power-up mode.
802.3af	IEEE 802.3af 15W mode.
802.3af-high	IEEE 802.3af 30W mode.
802.3pre-at	IEEE 802.3 pre-at 30W mode.
802.3at	IEEE 802.3at 30W mode.
802.3pre-bt	IEEE 802.3 pre-bt 4-pair 60W mode.
802.3bt-type3	IEEE 802.3bt Type 3 60W mode.
802.3bt-type4	IEEE 802.3bt Type 4 90W mode.
ports	Specifies the port.
port_list	Port list separated by a comma or - .

Default

Depends on the maximum classification level supported by the platform. For example, the 5720 Series has a default classification level of 802.3bt-type4, while 5320 Series has a default classification level of 802.3at.

Usage Guidelines

Use the specified power-up classification instead of the default classification based on port type.

Example

The following command displays all classification options:

```
# configure inline-power classification ?
  802.3af         IEEE 802.3af 15W mode
  802.3af-high    IEEE 802.3af 30W mode
  802.3at         IEEE 802.3at 30W mode
  802.3bt-type3   IEEE 802.3bt Type 3 60W mode
  802.3bt-type4   IEEE 802.3bt Type 4 90W mode
  802.3pre-at     IEEE 802.3 pre-at 30W mode
  802.3pre-bt     IEEE 802.3 pre-bt 4-pair 60W mode
```

History

This command was first available in ExtremeXOS 31.3.

The **802.3af**, **802.3af-high**, and **802.3pre-at** options were added in ExtremeXOS 31.7.

configure inline-power detection ports

```
configure inline-power detection [802.3af-only | legacy-and-802.3af [4-
   point | 2-point] | bypass] ports port_list
```

Description

This command configures *PoE* device detection mode for Extreme Networks PoE devices and SummitStack. ExtremeSwitching platforms support per-port basis configuration.

Syntax Description

802.3af-only	IEEE 802.3af detection only.
legacy-and-802.3af	Capacitive and IEEE 802.3aqf detection.
4-point	Selects 4-point detection (default).
2-point	Selects 2-point detection (for extended detection signature range).
bypass	No detection phase.
port_list	Port list separated by a comma or - .

Default

Default is **legacy-and-802.3af** detection.

Usage Guidelines

None.

Example

```
# configure inline-power detection ports 1-2
```

History

This command was first available in ExtremeXOS 16.1.

4-point and **2-point** detection options were added in ExtremeXOS 22.5.

configure inline-power disconnect-precedence

```
configure inline-power disconnect-precedence [deny-port | lowest-
   priority]
```

Description

Configures the disconnect precedence priority for the switch when a new PD is detected and the measured inline power for that switch or specified slot is within 19 W of the switch's or slot's *PoE* power budget.

Syntax Description

deny-port	Specifies power be denied to PD requesting power, regardless of priority.
lowest-priority	Specifies power be withdrawn from lowest-priority port(s) when next PD requesting power connects.

Default

Deny-port.

Usage Guidelines

You configure this parameter for the switch and for the entire SummitStack; you cannot configure this per slot or per port.

If the power supplied to the PDs on a switch or specified slot exceeds the power that was budgeted for that switch or specified slot, the system disconnects power to one or more ports to prevent power overload.

You configure the switch to either deny power to the next PD that requests power on that switch or slot, regardless of the priority, or to disconnect those PDs on ports with lower priorities until there is enough power for the new PD. If you select this last argument and you did not configure port priorities or if several ports have the same priority, the switch withdraws power (or disconnects) those ports with the highest port number (s). For information about configuring the PoE priority for the ports, see `configure inline-power priority ports`

The default value is deny-port. So, if you do not change the default value and the switch's or slot's power is exceeded, the next PD requesting power will not be connected.

When the setting is lowest priority, the switch continues dropping ports with the lowest configured PoE port priorities, or the highest port number in the case of equal PoE port priorities, until there is enough power for the requesting PD.

From ExtremeXOS 30.2 , in ExtremeSwitching X465 series switches, when deny port is configured when ports are given priority, priority overtakes deny port action.

Example

The following command sets the switch to withdraw power from the lowest-priority port(s):

```
configure inline-power disconnect-precedence lowest-priority
```

History

This command was first available in ExtremeXOS 11.1.

- ExtremeSwitching 5720-48MXW—Switch Engine 32.1 and later.

configure inline-power label ports

```
configure inline-power label string ports port_list
```

Description

Lets you create your own label for a specified *PoE* port or group of PoE ports.

Syntax Description

string	Specifies a name up to 15 characters in length to identify the specified power port(s).
port_list	Specifies one or more ports or slots and ports.

Default

No label.

Usage Guidelines

Use the `show inline-power configuration ports` command, as shown in the following example, to display inline power configuration information, including the label (if any) for each port:

```
show inline-power configuration port 3:1-10
```

Following is sample output from this command on a SummitStack:

```
Port   Config   Operator Limit   Priority   Label
3:1    Enabled     16000 mW      Low        finance
3:2    Enabled     15000 mW      Low        finance
3:3    Enabled     15000 mW      Low
3:4    Enabled     15000 mW      Low
3:5    Enabled     15000 mW      Low
3:6    Enabled     15000 mW      Low        marketing
3:7    Enabled     15000 mW      Low        marketing
3:8    Enabled     15000 mW      Low        marketing
3:9    Enabled     15000 mW      Low
3:10   Enabled     15000 mW      Low
```

Example

The following command assigns the name “alpha-test_1” to port 1 on slot 4:

```
config inline-power label alpha-test_1 ports 4:1
```

History

This command was first available in ExtremeXOS 11.1.

- ExtremeSwitching 5720-48MXW—Switch Engine 32.1 and later.

configure inline-power operator-limit ports

```
configure inline-power operator-limit milliwatts ports [all |port_list]
```

Description

Sets the power limit allowed for PDs connected to the specified ports.

Syntax Description

milliwatts	An integer specifying the maximum allowed power in milliwatts.
port_list	Specifies one or more ports or slots and ports.

Default

PoE—15,400 mW.

PoE+—30,000 mW.

PoE++ Type 3—60,000 mW.

PoE++ Type 4—90,000 mW.

Usage Guidelines

This command sets the power limit that a PD can draw on the specified ports. For PoE, the range is 3000 to 16800mW and the default value is 15400 mW. For PoE+, the range is 3,000 to 30,000 mW and the default value is 30000 mW. For PoE++ Type 3, the range is 3,000 mW to 60,000 mW and the default value is 60,000 mW. For PoE++ Type 4, the range is 3,000 mW to 90,000 mW and the default value is 90,000 mW.

If the measured power for a specified port exceeds the port's operator limit, the power is withdrawn from that port and the port moves into a fault state.

If you try to set an operator-limit outside the accepted range, the system returns the following error message:

```
Error: Invalid operator-limit value. Must be in the range of 3000-90000 mW for PoE
802.3bt port
```

Example

The following command sets the limit for legacy PDs on ports 3–6 of slot 5 on a SummitStack to 10000 mW:

```
configure inline-power operator-limit 10000 ports 5:3-5:6
```

- ExtremeSwitching 5720-24MXW—Switch Engine 32.1 and later.
- ExtremeSwitching 5720-48MW—Switch Engine 32.1 and later.
- ExtremeSwitching 5720-48MXW—Switch Engine 32.1 and later.

configure inline-power priority ports

```
configure inline-power priority [critical | high | low] ports port_list
```

Description

Sets the *PoE* priority on the specified ports.

Syntax Description

critical | high | low	Sets the PoE priority for the specified ports.
port_list	Specifies one or more ports or slots and ports.

Default

Low.

Usage Guidelines

The system allocates power to those ports with the highest priorities first. This command can also be used in conjunction with the `configure inline-power disconnect-precedence` command. If you configure the disconnect precedence as lowest priority, then newly detected PDs will be powered if that port has higher priority than the existing powered ports.

If there are multiple ports at the same priority level (either configured or by default) and one of the ports must have power withdrawn because of excessive power demands, those ports with the lower port number are powered first. The higher port numbers have power withdrawn first in the case of equal PoE port priorities.

Example

The following command assigns a critical PoE priority on ports 4 – 6 on slot 3 on a SummitSwitch:

```
configure inline-power priority critical ports 3:4-3:6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on:

- ExtremeSwitching 5720-48MXW—Switch Engine 32.1 and later.

configure inline-power usage-threshold

```
configure inline-power usage-threshold threshold
```

Description

Sets the inline power usage *SNMP* event threshold.

Syntax Description

threshold	Specifies the percentage of budgeted power used on any *PoE* switch that causes the system to send an SNMP event and create a log message. The range 1 to 99; the default value is 70.

Default

70.

Usage Guidelines

This command sets the threshold for generating an SNMP event and an EMS message. On a SummitStack, this threshold is when the measured power for a PoE module compared to the budgeted power for that slot exceeds a certain value. On stand-alone switches, this threshold applies to the total power available to the entire switch. The configured threshold value initiates the event and message once that percentage of the budgeted power is being used.

The system generates an additional SNMP event and EMS message once the power usage falls below the threshold again; once the condition clears.

Example

The following command sets the inline power usage alarm threshold at 75%:

```
configure inline-power usage-threshold 75
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on:

configure ip anycast mac

```
configure ip anycast mac [none | mac]
```

Description

Specifies the anycast gateway MAC address that is used by VLANs that enable IP anycast.

Syntax Description

ip	Layer 3 Internet Protocol.
anycast	Configures IP anycast.
mac	Configures the IP anycast MAC address for VLANs with IP anycast enabled.
none	Unconfigures the previously configured MAC address.
mac	Specifies the MAC address.

Default

N/A.

Usage Guidelines

Use this command to specify the same IP address and MAC address on all edge technology devices. This allows seamless IP mobility in the network for edge devices. Using the **none** option unconfigures the previously set MAC address.

Example

The following example specifies the MAC address as 00:00:AB:BA:BA:BA:

```
# configure ip anycast mac 00:00:AB:BA:BA:BA
```

History

This command was first available in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip nat add vlan

```
configure ip nat add {vlan} vlan_name direction [ingress | egress |
   both]
```

Description

Adds VLANs to the Network Address Translation (NAT).

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies enabling NAT.
add	Specifies adding a VLAN.
vlan	Specifies adding a VLAN.
vlan_name	Specifies the VLAN to add.
direction	Configures directions for NAT translation on this VLAN.
ingress	Configures VLAN as an ingress VLAN for NAT. Dynamic port translation rules are created for flows ingressing on this VLAN.
egress	Configures VLAN as an egress VLAN for NAT. Dynamic port translation rules are not created for flows ingressing on this VLAN.
both	Configures VLAN for NAT in both directions. Dynamic port translation rules are created for flows ingressing on this VLAN.

Default

N/A.

Usage Guidelines

For NAT Port Translation (NAPT), dynamic NAPT rules are created for traffic coming on VLANs whose direction is configured as “ingress” or “both”.

To delete a VLAN, run the command `configure` **`ip nat delete`** {**`vlan`**} *`vlan_name`*.

Example

The following example adds the VLAN "vlan1" to NAT as an ingress VLAN:

```
# configure ip nat add vlan vlan1 direction ingress
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat aging-time

```
configure ip nat aging-time [minutes | none]
```

Description

Configures the time after which dynamic IP Network Address Translation (NAT) entries that are not active are removed.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
aging-time	Configures the time after which dynamic IP Network Address Translation (NAT) entries that are not active are removed.
minutes	Specifies the aging time in minutes. The default is 20 minutes. The range is 10 to 3,000 minutes.
none	Specifies not perform aging of NAT entries.

Default

By default, the aging time is 20 minutes.

Usage Guidelines

Example

The following example configures the NAT aging time to 45 minutes.

```
# configure ip nat aging-time 45
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat delete vlan

```
configure ip nat delete {vlan} vlan_name
```

Description

Deletes VLANs from the Network Address Translation (NAT).

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies enabling NAT.
delete	Specifies deleting a VLAN.
vlan	Specifies deleting a VLAN.
vlan_name	Specifies the VLAN to delete.

Default

N/A.

Usage Guidelines

To add a VLAN, run the command `configure` **ip nat add** {**vlan**} *vlan_name* **direction** [**ingress** | **egress** | **both**].

Example

The following example deletes the VLAN "vlan1" from NAT:

```
# configure ip nat delete vlan vlan1
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule destination

`configure` **ip nat rule** *rule_name* **destination** [[*dst_ip_addr* **new-destination** *new_dst_ip_addr* {{**vr**} *vr_name*}] | **none**]

Description

Configures the IP address that is to be translated and the IP address to which this is to be translated for destination Network Address Port (NAT) rules.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies NAT rule.
rule_name	Specifies the NAT rule name.
destination	Specifies modifying the destination IP address.
dst_ip_addr	Specifies the destination IP address that needs to be translated.
new-destination	Specifies a destination IP address after translation.
new_dst_ip_addr	Specifies the destination IP address after translation.
vr	Specifies a virtual router (VR) on which the packet is sent out after translation.
vr_name	Specifies an existing VR/VRF name on which the packet is sent out on after translation. If not specified, the VR context from where this command is executed is used.
none	Deletes the IP address configuration.

Default

If no VR is specified, the current VR context is used.

Usage Guidelines

This command configures the destination NAT rule address information. To configure the source information, run the command `configure` **`ip nat rule`** *`rule_name`* **`source`** `[[[`*`src_ip_addr src_mask`* `|` *`src_ipNetmask`* `] {{`**`source-vr`**`}` *`src_vr_name`*`}` **`new-source`** *`new_src_ip_addr`*`]` `|` **`none`**`]`.

Example

The following example configures the rule named "ipOnlyRule" to translate the destination the IP address from 121.144.169.196 to 10.20.30.40. The egress VLAN is present in the VR "VR-user-out":

```
# configure ip nat rule ipOnlyRule destination 121.144.169.196 new-destination
10.20.30.40 vr VR-user-out
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule destination protocol

```
configure ip nat rule rule_name destination protocol [[[tcp | udp |
   protocol_num] port port_num new-port new_port_num] | none]
```

Description

Configures the protocol that is to be translated and the protocol to which this is to be translated for destination Network Address Translation (NAT) rules.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies configuring NAT rules.
rule_name	Specifies the NAT rule name.
destination	Specifies modifying the destination L4 port number.
protocol	Selects the translates IP protocol.
tcp	Specifies Transmission Control Protocol (TCP).
udp	Specifies User Datagram Protocol (UDP).
protocol_num	Specifies the IP protocol number. The range is 1 to 255.
port	Specifies modifying an L4 port.
port_num	Specifies the L4 port number that needs to be translated.
new-port	Specifies the L4 port after translation.
new_port_num	Specifies the L4 port number after translation.
none	Deletes the protocol configuration.

Default

N/A.

Usage Guidelines

Example

The following example specifies for rule "rule1" that the destination protocol is TCP and the port is translated from port 1 to port 2:

```
# configure ip nat rule rule1 destination protocol tcp port 1 new-port 2
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule egress

`configure` **`ip nat rule`** *`rule_name`* **`egress`** {**`vlan`**} *`vlan_name`*

Description

Configures the egress VLAN on which the translated traffic is sent out on.

Syntax Description

`ip`	Specifies Internet Protocol (IP).
`nat`	Specifies NAT.
`rule`	Specifies configuring NAT rules.
`rule_name`	Specifies the NAT rule name.
`egress`	Specifies configuring the NAT egress VLAN.
`vlan`	Specifies the NAT egress VLAN.
`vlan_name`	Specifies the NAT egress VLAN name.

Default

N/A.

Usage Guidelines

To create an IP NAT rule, run the command `create` **`ip nat rule`** *`rule_name`* **`type`** [**`source-nat`** | **`napt`** | **`destination-napt`**].

Example

The following example configures the VLAN "VLAN1" as the egress VLAN for IP NAT rule "rule2":

```
# configure ip nat rule rule2 egress vlan vlan1
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule monitor

```
configure ip nat rule rule_name monitor [on | off]
```

Description

Enables or disables statistics monitoring (byte/packet counters) on a Network Address Translation (NAT) rule in the outward direction and counts Tx counters.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies a NAT rule.
rule_name	Specifies the name of the NAT rule to enable monitoring.
monitor	Specifies enabling monitoring.
on	Enables monitoring.
off	Disables monitoring.

Default

N/A.

Usage Guidelines

This command enables/disables statistics monitoring (byte/packet counters) on a NAT rule in the outward direction and counts Tx counters only. There is no provision for Rx counters.

Example

The following example enables monitoring on the NAT rule "rule1":

```
# configure ip nat rule rule1 monitor on
```

The following example disables monitoring on the NAT rule "rule1":

```
# configure ip nat rule rule1 monitor off
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule name

```
configure ip nat rule rule_name name new_rule_name
```

Description

Changes the name of an IP Network Address Translation (NAT) rule.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies configuring NAT rules.
rule_name	Specifies the current NAT rule name.
name	Specifies providing a new NAT rule name.
new_rule_name	Specifies the new NAT rule name.

Default

N/A.

Usage Guidelines

Example

The following example changes the name of the IP NAT rule "old_rule_name" to "new_rule_name":

```
# configure ip nat rule old_rule_name name new_rule_name
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip nat rule source

```
configure ip nat rule rule_name source [[[src_ip_addr src_mask |
   src_ipNetmask ] {{source-vr} src_vr_name} new-source new_src_ip_addr]
   | none]
```

Description

Configures the IP address that is to be translated and the IP address to which this is to be translated for source Network Address Translation (NAT) rules.

Syntax Description

ip	Specifies Internet Protocol (IP).
nat	Specifies NAT.
rule	Specifies NAT rule.
rule_name	Specifies the NAT rule name.
source	Specifies modifying the source IP address.
src_ip_addr	Specifies the source IP address that needs to be translated.
src_mask	Specifies source IP address mask.
src_ipNetmask	Specifies source IP address/netmask.
source-vr	Specifies a virtual router (VR) on which the packet to be translated arrives.
src_vr_name	Specifies an existing VR/VRF name on which the packet to be translated arrives. If not specified, the VR context from where this command is executed is used.
new-source	Specifies a source IP address after translation.
new_src_ip_addr	Specifies the source IP address after translation.
none	Deletes the IP address configuration.

Default

If no VR is specified, the current VR context is used.

Usage Guidelines

This command configures the source NAT rule address information. To configure the destination information, run the command `configure` **ip nat rule** *rule_name* **destination** [[*dst_ip_addr* **new-destination** *new_dst_ip_addr* {{**vr**} *vr_name*}] | **none**] .

The incoming and outgoing VLANs on the NAT router can be on different VRs. The VR on which the packet arrives is configured in this command. The packet after translation is sent out on the configured egress VLAN (`configure` **ip nat add** {**vlan**} *vlan_name* **direction** [**ingress** | **egress** | **both**]).

For a source-NAT rule (where either source or destination IP address is only translated), the source mask has to be specified as /32 or 255.255.255.255.

Example

The following example configures the rule named "ipOnlyRule" to translate the source the IP address from 10.20.30.40 to 121.144.169.196. The ingress VLAN is present in the VR "VR-user-in":

```
# configure ip nat rule ipOnlyRule source 10.20.30.40/32 source-vr VR-user-in new-source
121.144.169.196
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on the switches that support the IP NAT feature. For information about which switches support this and other features, see the *Switch Engine 32.2 Feature License Requirements* document.

configure iparp add proxy

```
configure iparp add proxy [ipNetmask | ip_addr {mask}] {vr vr_name} {mac
    | vrrp} {always}
```

Description

Configures the switch to respond to ARP requests on behalf of devices that are incapable of doing so.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
vr_name	Specifies a VR name.
mac	Specifies a MAC address to use in the ARP reply.
vrrp	Specifies a MAC address to use in the ARP reply. For VLANs running *VRRP*, the switch replies with the VRRP virtual MAC. For non-VRRP VLANs, the switch replies with the switch MAC.
always	Specifies that the switch responds regardless of the *VLAN* that the request arrives from.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When mask is not specified, an address with the mask 255.255.255.255 is assumed. When neither *mac* nor **vrrp** is specified, the MAC address of the switch is used in the ARP response. When **always** is specified, the switch answers ARP requests without filtering requests that belong to the same subnet of the receiving router interface.

After IP ARP is configured, the system responds to ARP requests on behalf of the device as long as the following conditions are satisfied:

- The valid IP ARP request is received on a router interface.
- The target IP address matches the IP address configured in the proxy ARP table.
- The source IP address is not on the same subnet as the target address (unless the always flag is set).

After all the proxy ARP conditions have been met, the switch formulates an ARP response using the configured MAC address in the packet.

The default maximum number of proxy entries is 256, but can be increased to 4096 by using the following command:

```
configure iparp max_proxy_entries max_proxy_entries
```

Example

The following example configures the switch to answer ARP requests for all devices with the address range of 100.101.45.1 to 100.101.45.255:

```
configure iparp add proxy 100.101.45.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp add

```
configure iparp add ip_addr {vr vr_name} mac
```

Description

Adds a permanent entry to the ARP table. You must specify the IP address and MAC address of the entry.

Syntax Description

ip_addr	Specifies an IP address.
vr_name	Specifies a VR name.
mac	Specifies a MAC address.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following example adds a permanent IP ARP entry to the switch for IP address 10.1.2.5:

```
configure iparp add 10.1.2.5 00:11:22:33:44:55
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp delete proxy

```
configure iparp delete proxy [[ipNetmask | ip_addr {mask}] {vr vr_name}
   | all]
```

Description

Deletes one or all proxy ARP entries.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
vr_name	Specifies a VR name.
all	Specifies all ARP entries.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When the mask is not specified, the software assumes a host address (that is, a 32-bit mask).

Example

The following command deletes the IP ARP proxy entry 100.101.45.0/24:

```
configure iparp delete proxy 100.101.45.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp delete

`configure iparp delete` *ip_addr* {**vr** *vr_name*}

Description

Deletes an entry from the ARP table.

Syntax Description

ip_addr	Specifies an IP address.
vr_name	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Removes any IP ARP entry (dynamic or permanent) from the table. You must specify the IP address of the entry to delete the entry.

Example

The following command deletes an IP address entry from the ARP table:

```
configure iparp delete 10.1.2.5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-arp fast-convergence

```
configure ip-arp fast-convergence [on | off]
```

Description

This command improves IP convergence for IP traffic.

Syntax Description

on	Fast-convergence on.
off	Fast-convergence off (default).

Default

Off.

Usage Guidelines

Use this command for quick recovery when running IP traffic over an *EAPS* ring.

Example

The following example shows output from the configure ip-arp fast-convergence on command:

```
# show iparp
VR            Destination      Mac                Age  Static  VLAN          VID   Port
VR-Default    10.109.1.2       00:04:96:52:2b:16    0      NO  box1-box2     950   3
VR-Default    10.109.1.6       00:04:96:52:2a:f2    0      NO  box1-box3     951   1
Dynamic Entries  :           2             Static Entries            :          0

```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp locktime

```
configure iparp {vr vr_name}{locktime locktime}
```

Description

Sets the time before a new entry can replace an old entry in the Address Resolution Protocol (ARP) table.

Syntax Description

vr	Specifies setting a VR or VRF.
vr_name	Specifies the name of the VR or VRF.
locktime	Specifies setting a time before a new entry can replace an old entry.
locktime	Sets locktime value (range 0–30,000 milliseconds). Default 1,000 milliseconds.

Default

The default locktime is 1,000 milliseconds.

Example

The following example sets the locktime to 5,000 milliseconds:

```
configure iparp locktime 5000
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp max_entries

`configure iparp max_entries` *`max_entries`*

Description

Configures the maximum allowed IP ARP entries.

Syntax Description

max_entries	Specifies the maximum number of IP ARP entries. The range is 1 to x, where x is the number listed for the appropriate platform in table below.

Default

The default value is 12,288, which is the combined value for all VRs, since VR-based maximum entries is not supported starting with ExtremeXOS 30.1.

Usage Guidelines

The maximum IP ARP entries include dynamic, static, and incomplete IP ARP entries. The range for the max_entries parameter is 1 to x, where x is the number listed for the appropriate platform in the following table.

Table 10: Maximum IP ARP Entries for each Platform

	Distributed IP ARP Feature Configuration	
Maximum Entries	Off (Default)	On
157,696	N/A	N/A

Starting with ExtremeXOS 30.1, the maximum configurable limit for IP ARP maximum entries is 157,696 for all platforms. A message appears if the configured value exceeds the theoretical hardware maximum limit depending on the platform.

Example

The following example sets the maximum IP ARP entries to 2000 entries:

```
configure iparp max_entries 2000
```

History

This command was first available in ExtremeXOS 10.1.

Support for up to 32,768 ARP entries was first available in ExtremeXOS 12.4.

Per virtual router capability deprecated and the maximum configurable limit changed to 157, 696 in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp max_pending_entries

```
configure iparp max_pending_entries max_pending_entries
```

Description

Configures the maximum allowed incomplete IP ARP entries.

Syntax Description

max_pending_entries	Specifies a number of maximum IP ARP entries.

Default

256.

Usage Guidelines

Range: 1–4,096.

Example

The following example sets the maximum pending IP ARP entries to 500 entries:

```
configure iparp max_pending_entries 500
```

History

This command was first available in ExtremeXOS 10.1.

Per virtual router capability deprecated in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp max_proxy_entries

```
configure iparp max_proxy_entries max_proxy_entries
```

Description

Configures the maximum allowed IP ARP proxy entries.

Syntax Description

max_proxy_entries	Specifies maximum number of IP ARP proxy entries.

Default

256.

Usage Guidelines

Range: 0–4,096.

Example

The following example sets the maximum IP ARP proxy entries to 500 entries:

```
configure iparp max_proxy_entries 500
```

History

This command was first available in ExtremeXOS 11.0.

Per virtual router capability removed in ExtremeXOS 30.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp proxy reachable | entry-required

```
configure iparp proxy [vlan all | {vlan} vlan_name] [reachable | entry-
   required]
```

Description

Configures whether the switch replies to ARP requests on the specified VLAN by proxy ARP if the route to the IP address is reachable, or only if proxy ARP entries have been created.

Syntax Description

vlan	Selects VLAN(s) for the ARP requests.
vlan_name	Specifies VLAN name for the ARP requests.
all	Specifies all VLANs for the ARP requests.
reachable	Specifies that the switch replies to ARP requests on the specified VLAN(s) by proxy ARP if the route to IP address is reachable. Configuration of proxy ARP entries is not required.
entry-required	Specifies that the switch replies to ARP requests on the specified VLAN(s) by proxy ARP only if proxy ARP entries have been created. (Default)

Default

The default behavior is for the switch to reply to ARP requests on the specified VLAN(s) by proxy ARP only if proxy ARP entries have been created.

Usage Guidelines

If an ARP request is received by the switch, it checks the ExtremeXOS proxy ARP table (user adds the entries through the CLI). If it is present, an ARP reply is sent. If not present, it searches for the entry in the kernel route table. If this IP address is reachable, then the ARP reply is sent.

The following table summarizes the this command's behavior:

	reachable	**entry-required** (or command not configured)
Entry present in proxy ARP Table (static entry added through command configure iparp add on page 623)	Reply to ARP request	Reply to ARP request
Static entry not present in proxy ARP table	Reply to ARP request if route is reachable	No reply to ARP request
No static entry, but route reachable.	Reply to ARP request	
No static entry and route is not reachable	No reply to ARP request	

	reachable	**entry-required** (or command not configured)
Static entry present and route is reachable	Reply to ARP request	
No static entry and route is not reachable	No reply to ARP request	
Route reachable	Reply to ARP request	
Route not reachable	No reply to ARP request	

Example

The following example configures the switch to reply to ARP requests on all VLANs by proxy ARP if the route to IP address is reachable:

```
configure iparp proxy vlan all reachable
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp reachable-time

```
configure iparp {reachable-time [auto | {reachable_time [seconds |
   milliseconds]}]}
```

Description

Sets the value for Address Resolution Protocol (ARP) reachable time

Syntax Description

reachable-time	Specifies setting the ARP reachable time.
reachable_time	Sets the value for the ARP reachable time (range is 1–1,474,515,000 milliseconds or 1–1,474,515 seconds).
auto	Specifies having the ARP reachable time set automatically to 3/4 of the configured ARP timeout (default).
milliseconds	When setting the reachable time value, specifies milliseconds as the time unit (range is 1–1,474,515,000).
seconds	When setting the reachable time value, specifies seconds (range is 1–1,474,515) as the time unit (default).

Default

The default setting is for the reachable time to be set automatically to 3/4 of the configured ARP timeout. If you set the time manually, the default unit of measure for the value is seconds.

Example

The following example sets the reachable time to 500,000 seconds:

```
configure iparp reachable-time 500000 seconds
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp retransmit-time

`configure iparp {`**`retransmit-time`** *`retransmit_time`*`}`

Description

Sets the value for Address Resolution Protocol (ARP) retransmit time

Syntax Description

`retransmit-time`	Specifies setting the retransmit time.
`retransmit_time`	Sets the retransmit time value (range is 1–4,294,967 seconds or 1–4,294,967,295 milliseconds). Default is 1 second.
`milliseconds`	When setting the retransmit time value, specifies milliseconds as the time unit (range is 1–4,294,967,295).
`seconds`	When setting the retransmit time value, specifies seconds (range is 1–4,294,967) as the time unit (default).

Default

The default setting for the retransmit time is 1 second. The default unit of measure is seconds.

Example

The following example sets the retransmit time to 500,000 seconds:

```
configure iparp retransmit-time 500000 seconds
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iparp timeout

```
configure iparp timeout {vr vr_name} minutes
```

Description

Configures the IP ARP timeout period.

Syntax Description

vr_name	Specifies which VR or VRF IP ARP setting to change.
minutes	Specifies a time in minutes.

Default

20 minutes.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

The range is 0-32,767. A setting of 0 disables timeout.

When the switch learns an ARP entry, it begins the timeout for that entry. When the timer reaches 0, the entry is aged out, unless IP ARP refresh is enabled. If ARP refresh is enabled, the switch sends an ARP request for the address before the timer expires. If the switch receives a response, it resets the timer for that address.

Newly configured ARP timeout values apply only to ARP entries that are learned after the new value is set. Previously learned ARP entries timeout after the previously configured time.

Example

The following command sets the IP ARP timeout period to 10 minutes:

```
configure iparp timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ipforwarding originated-packets

```
configure ipforwarding originated-packets [require-ipforwarding | dont-
   require-ipforwarding]
```

Description

Configures whether IP forwarding must be enabled on a *VLAN* before transmitting IP packets originated by the switch on that VLAN to a gateway.

Syntax Description

require-ipforwarding	Specifies that IP forwarding must be enabled on a VLAN before IP packets that originate on the switch can be transmitted to a gateway.
dont-require-ipforwarding	Specifies that all IP packets that originate on the switch can be transmitted, regardless of the IP forwarding configuration to the gateway.

Default

dont-require-ipforwarding.

Usage Guidelines

To display the current setting for this command, use the `show ipconfig` command.

Example

The following command configures the switch to transmit switch-originated packets to gateways only on those VLANs for which IP forwarding is enabled:

```
configure ipforwarding originated-packets require-ipforwarding
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ipmcforwarding

```
configure ipmcforwarding to-cpu [auto | off] ports port_list
```

Description

Configure whether IP multicast CPU filters are installed automatically.

Syntax Description

auto	The software will automatically program IP multicast processing based on configuration.
off	IP multicast packets received on this port are always flooded with no CPU processing.
port_list	Specifies on or more ports.

Default

N/A.

Usage Guidelines

IP forwarding and IPMC forwarding must be enabled for the configuration to operate.

Example

The following example configures automatic operation for port 2.1:

```
configure ipmcforwarding to-cpu auto ports 2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ipmroute add

```
configure ipmroute add [default | source-net mask-len | source-net mask]
   {{protocol} protocol} rpf-address {metric} {vr vr-name}
```

Description

Adds a static multicast route to the multicast routing table.

Syntax Description

default	Specifies default gateway.
source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is [1-32].
mask	Specifies a subnet mask.
protocol	Unicast routing protocol that is to be used for route learning.
rpf-address	Next hop through which the multicast source can be reached.
metric	Specifies a cost metric.
vr-name	Specifies the virtual router to which the route is added.

Default

The following defaults apply:

- metric—1
- vr-name—VR of the current CLI context
- protocol—none

Usage Guidelines

This command allows you to statically configure where multicast sources are located (even though the unicast routing table has different entries). It allows you to configure a multicast static route in such a way as to have non-congruent topology for Unicast and Multicast topology and traffic.

Example

The following example configures a multicast static route for all multicast sources within network subnet 192.168.0.0/16. Those sources are reachable through the gateway 192.75.0.91.

```
configure ipmroute add 192.168.0.0/16 192.75.0.91
```

The following example configures multicast static route for all sources via a single gateway with a metric of 100:

```
configure ipmroute add 0.0.0.0/0 192.75.0.91 100
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ipmroute delete

```
configure ipmroute delete [default | source-net/mask-len | source-net
   mask] {{protocol} protocol} rpf-address {vr vr-name}
```

Description

Deletes a static multicast address from the multicast routing table.

Syntax Description

default	Specifies default gateway.
source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is 1–32.
mask	Specifies a subnet mask.
protocol	Unicast routing protocol that is to be used for route learning.
rpf-address	Next hop through which the multicast source can be reached.
vr-name	Specifies the virtual router to which the route is added.

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

This command allows you to delete an existing multicast static route. It allows you to configure congruent topology for unicast and multicast packets and traffic.

Example

The following example deletes a multicast static route:

```
configure ipmroute delete 192.168.0.0/16 192.75.0.91
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ip-mtu vlan

```
configure ip-mtu mtu [ {vlan} vlan_name | vlan vlan_list]
```

Description

Sets the maximum transmission unit (MTU) for the *VLAN*.

Syntax Description

mtu	Specifies the IP maximum transmission unit (MTU) value. Range is from 1500 to 9194. However, CLI will allow the maximum limit upto 9216 considering port configuration such as tagging which influences L2 Header size. But the values greater than 9194 may lead to packet loss and hence not recommended.
vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.

Default

The default IP MTU size is 1500.

Usage Guidelines

Use this command to enable jumbo frame support or for IP fragmentation with jumbo frames. Jumbo frames are Ethernet frames that are larger than 1522 bytes, including 4 bytes used for CRC. Both endstations involved in the transfer must be capable of supporting jumbo frames. The switch does not perform IP fragmentation or participate in MTU negotiation on behalf of devices that do not support jumbo frames.

When enabling jumbo frames and setting the MTU size for the VLAN, keep in mind that some network interface cards (NICs) have a configured maximum MTU size that does not include the additional 4bytes of CRC included in a jumbo frame configuration. Ensure that the NIC maximum MTU is at or below the maximum MTU size configured on the switch. Frames that are larger than the MTU size configured on the switch are dropped at the ingress port.

If you use IP fragmentation with jumbo frames and you want to set the MTU size greater than 1500, all ports in the VLAN must have jumbo frames enabled.

Example

The following example sets the MTU size to 2000 for VLAN sales:

```
configure ip-mtu 2000 vlan sales
```

History

This command was available in ExtremeXOS 11.0.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute add blackhole ipv4 default

```
configure iproute add blackhole ipv4 default {multicast | multicast-only
   | unicast | unicast-only} {vr vrname}
```

Description

Adds a default blackhole route to the routing table. All traffic destined for an unknown IP destination is silently dropped, and no *ICMP (Internet Control Message Protocol)* message is generated.

Syntax Description

multicast	Adds the default blackhole route to the multicast routing table.
multicast-only	Adds the default blackhole route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the default blackhole route to the unicast routing table.
unicast-only	Adds the default blackhole route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the VR or VRF to which the route is added.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IP destination, and a blackhole route is for discarding traffic destined to a specified IP destination, a default blackhole route is for discarding traffic to the unknown IP destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route's origin is "b" or "blackhole" and the gateway IP address for this route is 0.0.0.0.

Example

The following example adds a blackhole default route into the routing table:

```
configure iproute add blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute add blackhole ipv6 default

```
configure iproute add blackhole ipv6 default {vr vr_name} {multicast-
   only | unicast-only}
```

Description

Adds a default blackhole route to the routing table. All traffic destined for an unknown IPv6 destination is silently dropped.

Syntax Description

vr_name	Specifies the VR or VRF to which the route is added.
multicast-only	Specifies only multicast traffic for the route.
unicast-only	Specifies only unicast traffic for the route.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IPv6 destination, and a blackhole route is for discarding traffic destined to a specified IPv6 destination, a default blackhole route is for discarding traffic to the unknown IPv6 destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route's origin is "b" or "blackhole" and the gateway IPv6 address for this route is ::.

The packets are silently discarded. In other words, no ICMP message is sent to indicate that the packets are discarded.

Example

The following example adds a blackhole default route into the routing table:

```
configure iproute add blackhole ipv6 default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add blackhole

```
configure iproute add blackhole {ipv6} [ipv6Netmask] {vr vr_name}
   {multicast-only | unicast-only}
```

Description

Adds a blackhole address to the routing table. All traffic destined for an unknown IPv6 destination is silently dropped.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
vr_name	Specifies the VR or VRF to which the route is added.
multicast-only	Specifies only multicast traffic for the route.
unicast-only	Specifies only unicast traffic for the route.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

A blackhole entry directs packets with a matching specified address prefix to be discarded. Blackhole entries are useful as a security measure or in special circumstances where a specific destination address must be discarded. Blackhole entries are treated like permanent entries in the event of a switch reset or power off/on cycle.

The packets are silently discarded. In other words, no *ICMP* message is sent to indicate that the packets are discarded.

Example

The following example causes packets with a destination address of 2001:db8::3452 to be silently discarded:

```
configure iproute add blackhole 2001:db8::3452/128
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add default

```
configure iproute add default [gateway |ipv6Gateway | ipv6ScopedGateway]
   {bfd}{metric} {vr vr_name} {multicast |multicast-only |unicast |
   unicast-only} {vlan vlan_name}
```

Description

Adds a default gateway to the routing table.

Syntax Description

gateway	Specifies a gateway IPv4 address.
ipv6Gateway	Specifies a *VLAN* gateway IPv6 address.
ipv6ScopedGateway	Specifies a scoped gateway.
bfd	Enables Bidirectional Forwarding Detection (BFD) protection for the route. Note: You must type this keyword before specifying a VLAN.
metric	Specifies a cost metric. If no metric is specified, the default of 1 is used.
vr_name	Specifies the VR or VRF to which the route is added.

Default

If no metric is specified, the default metric of 1 is used. If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IPv6 interface. Use the unicast-only or multicast-only options to specify a particular traffic type. If not specified, both unicast and multicast traffic uses the default route.

Example

The following example configures a default route for the switch:

```
configure iproute add default 2001:db8::1234:5678
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add (IPv4)

```
configure iproute add [ipNetmask | ip_addr mask] gateway {bfd}
   {metric} {multicast | multicast-only | unicast | unicast-only} {vlan
   egress_vlan} {vr vrname}
```

Description

Adds a static route to the specified routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a gateway IP address.
bfd	Enables Bidirectional Forwarding Detection (BFD) protection for the route. Note: You must type this keyword before specifying a VLAN.
metric	Specifies a cost metric.
multicast	Adds the specified route to the multicast routing table.

multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vlan	Specifies the egress *VLAN* name used for an Inter-VR route.
vrname	Specifies the VR or VRF to which the route is added.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Use a mask value of 255.255.255.255 to indicate a host entry.

The gateway address must be present on a directly attached subnet, or the following message appears:

```
ERROR: Gateway is not on directly attached subnet
```

The gateway address must be different from loop back address or local addresses, or the following message appears:

```
ERROR: Gateway cannot be local or loop back address
```

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

This command can add BFD protection to a link only when the BFD client at each end of the link is enabled (see the `configure iproute add (IPv4)` command).

Once the BFD session is established, the operational status of the route reflects the operational status of the BFD session.

To remove BFD protection for a static route, enter this command without the BFD keyword.

Beginning in ExtremeXOS 15.6, the egress VLAN name may now be a VLAN belonging to a VR different from the VR of the static route itself. When the VRs differ, Inter-VR routing of hardware and software forwarded packets is performed.

Example

The following example adds a static address to the routing table in the current VR context:

```
configure iproute add 10.1.1.0/24 123.45.67.1
```

In the following example of an Inter-VR routing scenario, VLAN v1 belongs to VR vr1, and VLAN v2 belongs to VR vr2. The final two commands add Inter-VR routes between VR vr1 and VR vr2. The resulting behavior is that IPv4 unicast packets originating in VR vr1, and a destination IP address in subnet 52.0.0.0/8, are forwarded to gateway 20.1.1.2 belonging to VLAN v2 in VR vr2 per the first Inter-VR route. Reverse packets originating in VR vr2 with a destination IP address in subnet 51.0.0.0/8 are forwarded to gateway 10.1.1.2 belonging to VLAN v1 in VR vr1 per the second Inter-VR route. The **vr** *vr_name* of the static route command refers to which VR's route table the route is added.

```
create vr "vr1"
create vr "vr2"
create vlan "v1" vr vr1
create vlan "v2" vr vr2
configure vlan v1 tag 10
configure vlan v2 tag 20
configure vlan v1 add ports 1 tagged
configure vlan v2 add ports 2 tagged
configure vlan v1 ipaddress 10.1.1.1/8
configure vlan v2 ipaddress 20.1.1.1/8
enable ipforwarding vlan v1
enable ipforwarding vlan v2

configure iproute add 52.0.0.0/8 20.1.1.2 vlan v2 vr vr1
configure iproute add 51.0.0.0/8 10.1.1.2 vlan v1 vr vr2
```

The Inter-VR routing example above is for packets routed through a gateway to a remote subnet. Inter-VR routing can also be accomplished to/from a host adjacent to the switch, such as hosts in the switch's IPv4 ARP cache, by adding a /32 host route. In the example network above, to have packets from VR1 route to a host/server in VR2 directly on the 20.1.1.1/8 subnet, such as 20.1.1.66, the following CLI command can be used by specifying 20.1.1.66/32:

```
configure iproute add 20.1.1.66/32 20.1.1.66 vlan v2 vr vr1
```

History

This command was first available in ExtremeXOS 10.1.

Beginning in ExtremeXOS 15.6, the egress VLAN name may now be a VLAN belonging to a VR different from the VR of the static route itself.

Platform Availability

This command is available on all platforms with Layer 3 support.

configure iproute add (IPV6)

```
configure iproute add ipv6Netmask [ipv6Gateway | ipv6ScopedGateway]
   {bfd} {metric} {vr vr_name} {multicast | multicast-only | unicast |
   unicast-only}
```

Description

Adds an IPv6 static route to the routing table.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
ipv6Gateway	Specifies a gateway.
ipv6ScopedGateway	Specifies a scoped gateway.
bfd	Enables Bidirectional Forwarding Detection (BFD) protection for the IPv6 route.
metric	Specifies a cost metric.
vr_name	Specifies the VR or VRF to which the route is added.
multicast	Adds the specified route to the multicast routing table.
multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS release 12.1.

Default

If you do not specify a VR or VRF, the current VR context is used. If you do not specify a metric, then the default metric of 1 is used.

Usage Guidelines

Use a prefix length of 128 to indicate a host entry.

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

Example

The following example adds a static route to the routing table:

```
configure iproute add 2001:db8:0:1111::/64 fe80::1111%default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add lsp

```
configure iproute add [ipaddress netmask | ipNetmask] lsp lsp_name
   {metric} {multicast | multicast-only | unicast | unicast-only} {vr
   vrname}
```

Description

Assigns a specific IP route to use a named LSP.

Note

To create a static IP route that does not use a specific named LSP as an mpls-next-hop, use the following command: `configure iproute add [ipNetmask | ip_addr mask] gateway {metric} {multicast | multicast-only | unicast | unicast-only} {vr vrname}` .

Syntax Description

ipaddress	Specified an IP address.
netmask	Specifies an IP address/prefix length.
ipNetmask	Specifies an IP address/prefix length.
lsp_name	Specifies a named *MPLS* LSP to be used to reach the route.
metric	Specifies a cost metric.
multicast	Adds the specified route to the multicast routing table.
multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS release 12.1.
vrname	Specifies the virtual router to which the route is added.

Default

N/A.

Usage Guidelines

This command assigns a named LSP to a specific IP route. Once configured, all IP traffic matching the configured route is forwarded over the specified LSP. For an RSVP-TE LSP, the correct label information

is only associated with the route if the LSP is active. If the RSVP-TE LSP is disabled or is withdrawn, the label information is removed from the route table and the route entry is marked down. If multiple LSPs are added to a route and *ECMP* is enabled using route-sharing command, only one LSP is used to forward IP traffic.

Note
IP routes can only be assigned to named LSPs in the VR in which MPLS is configured to operate.

Example

The following command adds a static address to the routing table:

```
configure iproute add 10.1.1.0/24 lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add (Multicast)

```
configure iproute add [ipNetmask | ip_addr mask] gateway {bfd} {metric}
   {multicast | multicast-only | unicast | unicast-only} {vr vrname}
```

Description

Adds a static route to the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a *VLAN* gateway.
bfd	Enables Bidirectional Forwarding Detection (BFD) protection for the IPv6 route.
metric	Specifies a cost metric.
vrname	Specifies the virtual router to which the route is added.
multicast	Adds the specified route to the multicast routing table.

multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS 12.1.

Default

If you do not specify a virtual router, the current virtual router context is used.

Usage Guidelines

Use a mask value of 255.255.255.255 to indicate a host entry.

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

Example

The following example adds a static address to the multicast routing table:

```
configure iproute add 10.1.1.0/24 123.45.67.1 5 multicast
```

History

This command was first available in ExtremeXOS 10.1.

The **multicast** and **unicast** keywords were first available in ExtremeXOS 12.1. These keywords replace **multicast-only** and **unicast-only**, which remain in the software for backward compatibility.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute add protection

```
configure iproute add [default | ipv4_or_ipv6_network] gateway
   {protection [bfd | ping | none]}
```

Description

Configures protection and resiliency on IPv4 and IPv6 static routes.

Syntax Description

default	Default route.
ipv4_or_ipv6_network	IPv4 or IPv6 network address.
gateway	Gateway IP address.
protection	Selects the type of protection on this route (default is none).
bfd	Enables BFD protection on this route.
ping	Enables *ICMP* ping protection on this route.
none	Disables all protection on this route (default).

Default

No protection is the default.

Usage Guidelines

For static routes configured with protection type ping, static routes are initially down. Static routes become "up" for each configured gateway/device IP when a timely ICMP Echo Reply is received from that IP within the configured ping interval. Static routes transition from up to down when no timely reply is received for the configured number of missed intervals. Severely delayed ICMP Echo Replies are ignored if received after the configured interval time elapses, because a new ICMP Echo Request has already been sent. Static routes with ping protection need not be *ECMP* routes. Thus when a device is unresponsive, a different route with a higher cost or shorter prefix length can route packets elsewhere.

The protection type (BFD, ping, or none) for an existing static route can be changed dynamically without deleting the route. To change the protection type, simply re-add an existing static route with a different protection type.

Example

The following example adds a static route for 100.0.0.0/24 with ping health check monitoring to gateway IP 1.2.3.4.

```
# configure iproute add 100.0.0.0/24 1.2.3.4 protection ping
```

ExtremeXOS initiates ping health check monitoring to the adjacent device with IP address 1.2.3.4. The route for 100.0.0.0/24 is protected, meaning if ping responses are received from 1.2.3.4 in a timely manner, the static route for 100.0.0.0/24 to 1.2.3.4 is “up” in the routing table. If no ping response is received in a timely manner, the route is down.

In an example with ECMP, assuming `enable iproute sharing`:

```
# configure iproute add 100.0.0.0/24 1.2.3.5 protection ping
```

If ping responses are received by both 1.2.3.4 and 1.2.3.5, IP packets destined to subnet 100.0.0.0/24 are Layer-3 load balanced by hardware between 1.2.3.4 and 1.2.3.5. If for example, no ping response is received from 1.2.3.4 in a timely manner, IP packets destined to 100.0.0.0/24 are sent only to 1.2.3.5. Later, upon receiving a ping response from 1.2.3.4, packets are load balanced again.

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure iproute delete

```
configure iproute delete [ipNetmask | ipaddress mask] gateway {multicast
   | multicast-only | unicast | unicast-only} {vlan egress vlan} {vr
   vrname}
```

Description

Deletes a static address from the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ipaddress	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a *VLAN* gateway.
multicast	Specifies a multicast route to delete.
multicast-only	Specifies a multicast route to delete.
unicast	Specifies a unicast route to delete.
unicast-only	Specifies a unicast route to delete.
vlan	Specifies the egress VLAN name used for an Inter-VR route.
vrname	Specifies the virtual router to which the route is deleted.

Default

If you do not specify a virtual router, the current virtual router context is used.

Usage Guidelines

Use a value of 255.255.255.255 or /32 for mask to indicate a host entry.

Example

The following example deletes an address from the multicast routing table:

```
configure iproute delete 10.101.0.0/24 10.101.0.1 multicast
```

History

This command was first available in ExtremeXOS 10.1.

The **multicast** and **unicast** keywords were first available in ExtremeXOS 12.1. These keywords replace **multicast-only** and **unicast-only**, which remain in the software for backward compatibility.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute delete blackhole

```
configure iproute delete blackhole [ipv6Netmask] {vr vr_name}
```

Description

Deletes a blackhole route from the routing table.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

A blackhole entry directs packets with a specified destination address to be discarded. Blackhole entries are useful as a security measure or in special circumstances where a specific destination address must be discarded. Blackhole entries are treated like permanent entries in the event of a switch reset or power off/on cycle.

Example

The following example deletes a blackhole route from the routing table for packets with a destination address of 2001:db8::3452, so the packets are no longer discarded:

```
configure iproute delete blackhole 2001:db8::3452/128
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute delete blackhole ipv4 default

```
configure iproute delete blackhole ipv4 default {multicast | multicast-
   only | unicast | unicast-only} {vr vrname}
```

Description

Deletes a default blackhole route from the routing table.

Syntax Description

multicast	Specifies a default blackhole multicast route to delete.
multicast-only	Specifies a default blackhole multicast route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Specifies a default blackhole unicast route to delete.
unicast-only	Specifies a default blackhole unicast-only route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies a VR or VRF name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following command deletes a blackhole default route from the routing table:

```
configure iproute delete blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute delete blackhole ipv6 default

```
configure iproute delete blackhole ipv6 default {vr vr_name}
```

Description

Deletes a default blackhole route from the routing table.

Syntax Description

vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IPv6 destination, and a blackhole route is for discarding traffic destined to a specified IPv6 destination, a default blackhole route is for discarding traffic to the unknown IPv6 destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route's origin is "b" or "blackhole" and the gateway IPv6 address for this route is "::."

Example

The following example deletes a blackhole default route from the routing table:

```
configure iproute delete blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute delete default

```
configure iproute delete default [ipv6Gateway | ipv6ScopedGateway] {vr
   vr_name}
```

Description

Deletes a default gateway from the routing table.

Syntax Description

ipv6Gateway	Specifies a *VLAN* gateway IPv6 address.
ipv6ScopedGateway	Specifies a scoped gateway.
vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If no metric is specified, the default metric of 1 is used. If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IPv6 interface.

Example

The following example deletes a default route from the switch:

```
configure iproute delete default 2001:db8::1234:5678
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure iproute ipv6 priority

```
configure iproute ipv6 priority [auto-peering | ripng | blackhole | icmp
   | host-mobility | static | ospfv3-intra | ospfv3-inter | ospfv3-as-
   external | ospfv3-extern1 | ospfv3-extern2 | isis |isis-level-1 |
   isis-level-2 | isis-level-1-external | isis-level-2-external | ebgp |
   ibgp] priority {vr vr_name}
```

Description

Changes the priority for all routes from a particular route origin.

Syntax Description

auto-peering	Specifies auto-peering routes.
ripng	Specifies *RIPng*.
host-mobility	Host-Mobility route.
blackhole	Specifies the blackhole route.
icmp	Specifies *ICMP*.
static	Specifies static routes.
ospfv3-intra	Specifies *OSPFv3* Intra routing.
ospfv3-inter	Specifies OSPFv3 Inter routing.
ospfv3-as-external	Specifies OSPFv3 AS External routing.
ospfv3-extern1	Specifies OSPFv3 External 1 routing.
ospfv3-extern2	Specifies OSPFv3 External 2 routing.
isis	Specifies ISIS routing.
isis-level-1	Specifies IS-IS Level 1 routing.
isis-level-2	Specifies IS-IS Level 2 routing.
isis-level-1-external	Specifies IS-IS Level 1 External routing.
isis-level-2-external	Specifies IS-IS Level 2 External routing.
ebgp	Specifies EBGP routes.
ibgp	Specifies IBGP routes.
priority	Specifies a priority number in the range of 11 to 65534.
vr_name	Specifies a VR or VRF name.

Default

The following table lists the relative priorities assigned to routes depending upon the learned source of the route.

Table 11: Route Priorities

Route Origin	Priority
Direct	10
BlackHole	50
Static	1100
HostMobility	1150
ICMP	1200
OSPF3Intra	2200
OSPF3Inter	2300
IS-IS L1	2360
IS-IS L2	2370
RIPg	2400
OSPFv3 ASExt	3100
OSPFv3 Extern1	3200
OSPFv3 Extern2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500

Usage Guidelines

Although these priorities can be changed, do not attempt any manipulation unless you are expertly familiar with the possible consequences. If you change the route priority, you must save the configuration and reboot the system.

Note
The priority for a blackhole route can not overlap with the priority of any other route origin.

Example

The following example sets the IPv6 route priority for static routing to 1200:

```
configure iproute ipv6 priority static 1200
```

History

This command was first available in ExtremeXOS 11.2.

The vr option was added in ExtremeXOS 12.1.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document..

configure iproute priority

```
configure iproute {ipv4} priority [auto-peering | blackhole | bootp
   | ebgp |host-mobility | ibgp | icmp | isis | isis-level-1 | isis-
   level-1-external | isis-level-2 | isis-level-2-external | mpls |
   ospf-as-external | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-
   intra | rip | static | evpn] priority {vr vrname}
```

Description

Changes the priority for all routes from a particular route origin.

Syntax Description

auto-peering	Specifies the auto-peering route.
blackhole	Specifies the blackhole route.
bootp	Specifies BOOTP.
ebgp	Specifies E-*BGP* routes.
host-mobility	Host-Mobility route.
ibgp	Specifies I-BGP routes.
icmp	Specifies *ICMP*.
isis	Specifies IS-IS and applies only to blackhole routes installed for summary addresses.
isis-level-1	Specifies IS-IS Level 1 routing.
isis-level-1-external	Specifies IS-IS Level 1 External routing.
isis-level-2	Specifies IS-IS Level 2 routing.
isis-level-2-external	Specifies IS-IS Level 2 External routing.
mpls	Specifies *MPLS* routing.
ospf-as-external	Specifies *OSPF* as External routing.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies *RIP*.
static	Specifies static routes.
evpn	Specifies EVPN routes.

priority	Specifies a priority number in the range of 11 to 65534.
vrname	Specifies a VR or VRF name.

Default

The following table lists the relative priorities assigned to routes depending upon the learned source of the route.

Table 12: Relative Route Priorities

Route Origin	Priority
Direct	10
MPLS	20
Blackhole	50
Static	1100
HostMobility	1150
ICMP	1200
EVPN	1698
Autopeering	1699
EBGP	1700
IBGP	1900
OSPFIntra	2200
OSPFInter	2300
IS-IS	2350
IS-IS L1	2360
IS-IS L2	2370
RIP	2400
OSPFAsExt	3100
OSPF External 1	3200
OSPF External 2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500
BOOTP	5000

Usage Guidelines

Although priorities can be changed, you should not attempt to do so unless you are certain of the possible consequences of the change. If you change the route priority, you must save the configuration and reboot the system.

Note
The priority for a blackhole route cannot overlap with the priority of any other route origin.

Example

The following example sets IP route priority for static routing to 1200:

```
# configure iproute priority static 1200
```

History

This command was first available in ExtremeXOS 10.1.

The route priority restrictions were added in ExtremeXOS 11.1.

The **ipv4** keyword was added in ExtremeXOS 11.2.

The **vr** option was added in ExtremeXOS 12.1.2.

The **evpn** option was added in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute reserved-entries

```
configure iproute reserved-entries [ num_routes_needed | maximum |
   default ] slot [all | slot_num]
```

Description

Reserves storage space for IPv4 and IPv6 routes in the Longest Prefix Match (LPM) hardware tables, allowing individual local and remote IPv4 unicast hosts to occupy the unused portions of the tables.

Syntax Description

num_routes_needed	Specifies a specific number of routes to reserve.
maximum	Reserves the maximum amount of space for IP route entries. No IPv4 hosts are stored in the LPM and External tables.
default	Reserves the default amount of space for IP route entries.

all	For SummitStack switches only, this option applies the reservation to all applicable slots.
slot_num	For SummitStack switches only, this option applies the reservation to the specified slot.

Usage Guidelines

Demand on the Layer 3 Hash table can be reduced by allowing IPv4 hosts to be stored in the LPM tables instead. This command allows you to reserve a portion of the LPM tables for routes, and this creates an unreserved portion that can be used to store IPv4 hosts. For more information, see the "Extended IPv4 Host Cache" section of the *Switch Engine 32.2 User Guide*.

The default setting can support most networks, but if more than a few hundred local IP hosts and IP multicast entries are present, you can improve switch performance by calculating and configuring the reserved space for route entries to allow unreserved space for IPv4 hosts. Changing the number of reserved route entries does not require a reboot of the affected slots or switch.

You can view the current LPM hardware table usage by entering the `show iproute reserved-entries statistics` command. The LPM table statistics are in the columns under the In HW Route Table heading.

If the switch contains fewer routes than the capacity of the LPM tables, the number of route entries to reserve for a slot or switch should be the number of routes currently used in the hardware tables, plus an additional cushion for anticipated growth. Because each IPv6 route takes up the space of two IPv4 routes, the number of route entries to reserve is two times the value in the IPv6 routes column, plus the value in the IPv4 routes column, plus room for anticipated growth. For example, if you want to reserve space for 100 IPv4 routes and 20 IPv6 routes, the required number of route entries is 140 (100 + 2*20).

The maximum value for num_routes_needed for ExtremeSwitching 5420 switches is 12,256. For all other models, 16,352.

The maximum values shown above apply to ExtremeSwitching series switches operating independently or as part of a SummitStack. The maximum option can be used to specify the maximum values.

When maximum is specified, IPv4 hosts do not occupy LPM table space. Note that when maximum is specified, software forwarding can result, depending on the utilization and addresses in the Layer 3 Hash table, and is therefore not recommended.

When Algorithmic Longest-Prefix Match (ALPM) is configured using `configure forwarding internal-tables` **`more routes`**, the value for reserved-entries is treated as "maximum". Therefore, IPv4 hosts do not occupy LPM table space in order to maximize route capacity.

If the switch contains more routes than the capacity of the LPM tables, a trade-off can be made. You can choose to reserve 400 iproute entries, for example. The 400 IPv4 routes with the longest length network masks will be installed in the LPM table, and the remainder of the LPM table can be used for cache space for local and remote hosts. The remote host entries are only required for IPv4 addresses matching one of the 300 routes not installed in the LPM table. Since in this example, not all routes can be stored anyway, leaving appropriate room for individual remote hosts can result in more fast-path forwarding.

Depending on the actual routes present, IP route compression for IPv4 and/or IPv6 can be enabled to reduce the number of routes required in the LPM tables. For more information, see the description for the following command: `enable iproute compression {vr vrname}`

Example

The following command reserves up to 140 IPv4 routes or 70 IPv6 routes, or any combination in between, on all switches in a SummitStack:

```
# configure iproute reserved-entries 140 slot all
```

For details on the configuration changes, see the command descriptions for the following commands:

`show iproute reserved-entries`

`show iproute reserved-entries statistics`

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute protection ping interval

`configure iproute {ipv4 | ipv6} protection ping interval seconds miss misses`

Description

Configures the desired interval between pings and number of misses for ping protection of IPv4 and IPv6 static routes.

Syntax Description

ipv4	Designates IPv4 settings (default).
ipv6	Designates IPv6 settings.
protection	Configures route protection settings.
ping	Configures static route ping protection interval and number of misses.
interval	Number of seconds between pings to protected gateways. Ping response must be received within configured interval.
seconds	Number of seconds between pings to protected gateways. Range is 1–600. Default is 2.

miss	Number of pings with no response before associated routes are considered down.
misses	Number of pings with no response before associated routes are considered down. Range is 2–255. Default is 3.

Default

If not specified, IPv4 is the default, and:

- Interval = 2 seconds
- Misses = 3

Usage Guidelines

At the configurable interval, each unique gateway or device IP address configured for static route ping protection is sent an *ICMP* or ICMPv6 Echo Request if the ARP or Neighbor cache entry already has the IP->MAC binding. An ARP or Neighbor Solicitation is sent if the IP->MAC binding is unknown, and upon receiving a response, the ICMP Echo Request is sent.

The desired interval between pings and number of misses can be configured independently for IPv4 and IPv6.

Example

The following example sets for IPv4 a ping interval of 3 seconds and number of missed pings to 5:

```
# configure iproute ipv4 protection ping interval 3 miss 5
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on all platforms with any license level as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure iproute sharing hash-algorithm crc

```
configure iproute sharing {hash-method default} hash-algorithm crc
   [lower | upper]
```

Description

This command is used to configure the "default" hash algorithm used to choose a gateway when hardware forwards an IPv4 or IPv6 unicast packet to a route with multiple equal-cost multipath gateways.

For information about configuring the custom hash method, see the command configure iproute sharing hash-method custom.

The values within the IP unicast packet that are considered in the hash calculation depend on the setting of another command, `configure forwarding sharing [L3 | L3_L4]`. With the default, L3_L4, the hash calculation includes Source and Destination IP addresses, and the Source and Destination Layer 4 Port numbers. Or, if `configure forwarding sharing L3` is configured, the hash calculation only includes Source and Destination IP addresses. The distribution of packets among multiple gateways based on the IP Route Sharing lower or upper hash algorithm will depend on network traffic. The command will not result in traffic loss and takes effect immediately.

Syntax Description

iproute	IP routing module.
sharing	Configure settings for equal cost multipath routing";capability="route_sharing.
hash-method	Configures hardware forwarding hash method used to select among *ECMP* gateways for an IPv4 or IPv6 destination.
default	Default method for ECMP hardware hash calculation. For information about configuring the custom hash method, see the `configure iproute sharing` **hash-method custom** {**hash-algorithm** [**xor** | **crc-16** | **crc-32** [**lower** | **upper**]]} command.
hash-algorithm	Configure hardware forwarding hash algorithm used to select among ECMP gateways for an IPv4 or IPv6 destination";capability="pib".
crc	Cyclic Redundancy Check (CRC).
lower	Lower bits of CRC32 hash calculation of source and destination packet criteria, used to select an ECMP gateway (Default).
upper	Upper bits of CRC32 hash calculation. May improve distribution when source and destination IP and ports do not vary much.

Default

Lower.

Usage Guidelines

Use this command to configure the hash algorithm used to choose a gateway when hardware forwards an IPv4 or IPv6 unicast packet to a route with multiple equal-cost multipath gateways. The values within the IP unicast packet that are considered in the hash calculation depend on the setting of another command, `configure forwarding sharing [L3 | L3_L4]`. With the default, L3_L4, the hash calculation includes Source and Destination IP addresses, and the Source and Destination Layer 4 Port numbers. Or, if `configure forwarding sharing L3` is configured, the hash calculation only includes Source and Destination IP addresses. The distribution of packets among multiple gateways based on the IP Route Sharing lower or upper hash algorithm will depend on network traffic. The command will not result in traffic loss and takes effect immediately.

Example

```
# configure iproute sharing hash-algorithm upper
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iproute sharing max-gateways

```
configure iproute sharing max-gateways max_gateways
```

Description

Specifies the maximum number of gateways in each gateway set in the *ECMP* hardware table.

Syntax Description

max_gateways	Specifies the maximum number of ECMP gateways in a gateway. The only values allowed are 2, 4, 8, 16, 32 and 64. For ExtremeSwitching 5520 series switches, the allowed values are 2,4, and 8.

Default

For all platforms except the ExtremeSwitching 5520 series switches, the default is 16 gateways.

For ExtremeSwitching 5520 series switches, the default is 4.

Usage Guidelines

When IPv4 or IPv6 route sharing is enabled, the maximum number of gateways value represents the maximum number of next-hop gateways that can be used for communications with a destination subnet. Each gateway represents an alternative path to a subnet. The gateways can be defined with static routes, or they can be learned through the *OSPF*, *OSPFv3*, *BGP*, or IS-IS protocols. The value for max-gateways applies to both IPv4 and IPv6 on all VRs.

When Pseudowire Label Switch Path Load Sharing is enabled, the maximum number of gateways value represents the maximum number of LSPs that a pseudowire can use for multi-path transport.

The max-gateways setting changes how the hardware is configured for multi-path; however, individual protocols have multi-path limitations that may be lower than the configured max-gateways setting. Additionally, the values supported for the max-gateways setting may vary, depending on the platform. See the *ExtremeXOS Release Notes* for the supported values of max-gateways for each protocol and platform.

The *ExtremeXOS Release Notes* also list the total number of route destinations and the total combinations of gateway sets that each platform can support with the different max-gateways option selections. For more information on selecting the maximum number of gateways and how this affects different platforms, see the "ECMP Hardware Table" in the *Switch Engine 32.2 User Guide*.

You must save the configuration and reboot the switch for the new value to take effect. To see the current and configured value, use the commands `show ipconfig` or `show ipconfig ipv6`.

Example

The following example changes the maximum number of ECMP gateways per subnet or gateway set to 8:

```
configure iproute sharing max-gateways 8
```

History

This command was first available in ExtremeXOS 11.4.

The value 2 was first available in ExtremeXOS 12.0.2.

Support for shared gateway sets in the ECMP table was added in ExtremeXOS 12.4.

The values 16 and 32 were first available in ExtremeXOS 15.3.

This command first applied to IPv6 routes in ExtremeXOS 15.3.

The value 64 was added in ExtremeXOS 15.5.2

The default value for max. gateways was changed in ExtremeXOS 22.1 from 4 to 16. This applies only to new configurations. Existing configurations retain their settings.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches..

configure ip-security anomaly-protection icmp ipv4-max-size

```
configure ip-security anomaly-protection icmp ipv4-max-size size {slot
   [ slot | all ]}
```

Description

Configures the maximum IPv4 *ICMP* allowed size.

Syntax Description

size	Specifies the size of the IPv4 ICMP in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default size is 512 bytes.

Usage Guidelines

This command configures the IPv4 ICMP allowed size. The absolute maximum is 1023 bytes.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection icmp ipv6-max-size

```
configure ip-security anomaly-protection icmp ipv6-max-size size {slot
   [ slot | all ]}
```

Description

Configures the maximum ipv6 ICMP allowed size.

Syntax Description

size	Specifies the size of the IPv6 ICMP in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default size is 512 bytes.

Usage Guidelines

This command configures the IPv6 ICMP allowed size. The absolute maximum is 16K bytes.

You can use this command to configure the maximum IPv6 ICMP packet size for detecting IPv6 ICMP anomalies. If the next header in the IPv6 ICMP packet is not 0x3A:ICMP, this anomaly is not detected. For example, an IPv6 ICMP packet with packet header 0x2c: Fragment Header is not detected.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection notify cache

```
configure ip-security anomaly-protection notify cache size {slot [slot |
   all ]}
```

Description

Configures the size of local notification cache.

Syntax Description

size	Specifies the size of the local notification cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1000 events.

Usage Guidelines

This command configures the size of local notification cache. Cached events are stored in local memory. The range is between 1 and 1000 events per second. If the cache is full, newer events replace older events.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection notify rate limit

```
configure ip-security anomaly-protection notify rate limit value {slot
   [slot | all ]}
```

Description

Configures the rate limiting for protocol anomaly notification.

Syntax Description

value	Specifies the period of the rate limit.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 10 events per second.

Usage Guidelines

This is a paired command with `configure ip-security anomaly-protection notify rate window` that configures the rate limiting for protocol anomaly notification. When the anomaly notification is enabled, in order to avoid overloading CPU, the system generates only the number of limited notifications in a period of window seconds. The range is from 1 to 100 events.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection notify rate window

```
configure ip-security anomaly-protection notify rate window value {slot
   [slot | all ]}
```

Description

Configures the rate limiting for protocol anomaly notification.

Syntax Description

value	Specifies the period of the rate limit.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1 second.

Usage Guidelines

This is a paired command with `configure ip-security anomaly-protection notify rate limit` that configures the rate limiting for protocol anomaly notification. When the anomaly notification is enabled, in order to avoid overloading CPU, the system generates only the number of limited notifications in a period of window seconds. The range is between 1 and 300 seconds.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection notify trigger off

```
configure ip-security anomaly-protection notify trigger off value {slot
   [slot | all ]}
```

Description

Configures an anomaly rate-based notification feature.

Syntax Description

value	Specifies the number of events for the trigger.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1.

Usage Guidelines

This is a paired command with `configure ip-security anomaly-protection notify trigger on` that configures an anomaly rate-based notification feature. The anomaly notification is automatically triggered if the rate of anomaly events is greater than the configured ON value, and the notification is disabled if the rate falls below the value set in the `configure ip-security anomaly-protection notify trigger off` command.

The command takes effects after the anomaly notification is enabled.

Note

The value set in ON must be greater than or equal to the value set in OFF.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection notify trigger on

```
configure ip-security anomaly-protection notify trigger on value {slot
   [slot | all ]}
```

Description

Configures an anomaly rate-based notification feature.

Syntax Description

value	Specifies the number of events for the trigger.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1.

Usage Guidelines

This is a paired command with `configure ip-security anomaly-protection notify trigger off` that configures an anomaly rate-based notification feature. The anomaly notification is automatically triggered if the rate of anomaly events is greater than the configured ON value, and the notification is disabled if the rate falls below the value set in the `configure ip-security anomaly-protection notify trigger off` command.

The command takes effects after the anomaly notification is enabled.

Note

The value set in ON must be greater than or equal to the value set in OFF.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security anomaly-protection tcp

```
configure ip-security anomaly-protection tcp min-header-size size {slot
   [ slot | all ]}
```

Description

Configures the minimum TCP header allowed.

Syntax Description

size	Specifies the size of the header in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default value is 20 bytes.

Usage Guidelines

This command configures the minimum TCP header allowed. It takes effect for both IPv4 and IPv6 TCP packets.

The range of the minimum TCP header may be between 8 and 255 bytes.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-bindings add

```
configure ip-security dhcp-binding add ip ip_address mac mac_address
   [dynamic vlan_id | {vlan} vlan_name] server-port server_port client-
   port client_port lease-time seconds
```

Description

Creates a *DHCP* binding.

Syntax Description

ip_address	Specifies the IP address for the DHCP binding.
mac_address	Specifies the MAC address for the DHCP binding.
dynamic	Configuration options for dynamically created VLANs.
vlan_id	VLAN ID tag between 1 and 4,094.
vlan_name	Specifies the name of the *VLAN* for the DHCP binding.
server_port	Specifies the server port for the DHCP binding.
client_port	Specifies the client port for the DHCP binding.
seconds	Specifies the number of seconds for the lease.

Default

N/A.

Usage Guidelines

This commands allows you to add a DHCP binding in order to re-create the bindings after reboot and to allow IP Security features to work with clients having static IP addresses.

Note

Setting the lease-time to 0 causes the DHCP binding to be static; in other words, it is not aged-out if no DHCP renew occurs. This is for use with clients using static IP addresses.

History

This command was first available in ExtremeXOS 12.1.

Dynamic VLAN and VLAN ID options added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-bindings delete

```
configure ip-security dhcp-binding delete ip ip_address [dynamic vlan_id
   | {vlan} vlan_name]
```

Description

Deletes a *DHCP* binding.

Syntax Description

ip_address	Specifies the IP address for the DHCP binding.
vlan_name	Specifies the name of the *VLAN* for the DHCP binding.
dynamic	Configuration options for dynamically created VLANs.
vlan_id	VLAN ID tag between 1 and 4,094.

Default

N/A.

Usage Guidelines

This commands allows you to delete a DHCP binding created with the command `configure ip-security dhcp-binding add ip ip_address mac mac_address {vlan}vlan_name server-portserver_port client-portclient_port lease-timeseconds`.

History

This command was first available in ExtremeXOS 12.1.

Dynamic VLAN and VLAN ID options added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-bindings storage filename

```
configure ip-security dhcp-bindings storage filename name
```

Description

Creates a storage file for *DHCP* binding information.

Syntax Description

name	Specifies the name of the DHCP binding storage file.

Default

N/A.

Usage Guidelines

This commands allows you to configure the filename with which the DHCP bindings storage file is created on the external server when it is uploaded to the external server. The text file resides on an external server. You can configure the server with the command `configure ip-security dhcp-bindings storage location server [primary | secondary] ip_address | hostname]{vrvr-name} tftp`.

The bindings file must have a .xsf extension. If the input filename doesn't already have a .xsf extension, one is added automatically.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-bindings storage location

```
configure ip-security dhcp-bindings storage location server [primary |
   secondary] ip_address | hostname]{vr vr-name} tftp
```

Description

Specifies the server location for the *DHCP* bindings storage file. The uploads can be made to any TFTP server regardless of the virtual router that it is present in.

Syntax Description

ip_address	Specifies the IP address location for the bindings storage file.
hostname	Specifies the hostname of the server.
vr-name	Specifies the virtual router name.
none	Using no option unconfigures the server.

Default

N/A.

Usage Guidelines

This commands allows you to specify where you want to store the DHCP storage file that you created with the command `configure ip-security dhcp-bindings storage filename name`.

Note
Using the command with no option unconfigures the server.

Example

The following command configures storage to the primary server 10.1.1.14:

```
configure ip-security dhcp-bindings storage location server primary 10.1.1.14 vr "VR-Default" tftp
```

The following example unconfigures the primary server:

```
configure ip-security dhcp-bindings storage location server primary
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-bindings storage

```
configure ip-security dhcp-bindings storage [write-interval minutes |
   write-threshold num_changed_entries]
```

Description

Configures *DHCP* bindings file storage upload variables.

Syntax Description

minutes	Specifies the number of minutes for the write interval.
num_changed_entries	Specifies the limit for the write threshold.

Default

The default write threshold is 50 entries; the default write interval is 30 minutes.

Usage Guidelines

This commands allows you to configure the upload variables for the DHCP bindings file that you created with the command `configure ip-security dhcp-bindings storage filename name` and specified the location of with the command `configure ip-security dhcp-bindings storage location server [primary | secondary] ip_address | hostname]{vrvr-name} tftp`.

For redundancy, the DHCP bindings file is uploaded to both the primary and the secondary server. The failure of one upload (for example, due to a TFTP server timeout) does not affect the upload of any other.

When the maximum file size limit is reached, no additional DHCP bindings can be uploaded until one of the older bindings is removed.

The point at which DHCP bindings can be uploaded can be configured to work in one of the following ways:

- Periodic upload: Upload every N minutes, provided that DHCP bindings have changed since the last upload.
- Upload based on number of yet-to-be uploaded entries: Allows you to configure the maximum number of changed entries that are allowed to accumulate before being uploaded.

The write interval is configurable from 5 minutes to 1 day, with a default value of 30 minutes. The default value of the write threshold is 50 entries, with a minimum of 25 and maximum of 200.

Additions and deletions are considered changes, but updates are not, which means that DHCP renewals of existing leases are not counted.

By default, the write interval is in effect, but not the write-threshold. You may change whichever of these you wish by explicitly configuring the value.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information check

```
configure ip-security dhcp-snooping information check
```

Description

Enables the *DHCP* relay agent option (option 82) checking in the server-originated packets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command enables the checking of the server-originated packets for the presence of option 82. In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to prevent DHCP reply packets with invalid or missing relay agent options from being forwarded to the client. With checking enabled, the following checks and actions are performed:

- When the option 82 is present in the packet, the MAC address specified in the remote-ID sub-option is the switch system MAC address. If the check fails, the packet is dropped.
- When option 82 is not present in the packet, the DHCP packet is forwarded with no modification.

To disable this check, use the following command:

`unconfigure ip-security dhcp-snooping information check`

Example

The following command enables DHCP relay agent option checking:

```
configure ip-security dhcp-snooping information check
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information circuit-id port-information port

```
configure ip-security dhcp-snooping information circuit-id port-
   information port_info port port
```

Description

Configures the port information portion of the circuit ID.

Syntax Description

port_info	Specifies the circuit ID port information in the format of *VLAN Info-Port Info*; maximum length is 32 bytes.
port	Specifies the port for which *DHCP* Snooping should be enabled.

Default

The default value is the ASCII representation of the ingress port's *SNMP* ifIndex.

Usage Guidelines

This command allows you to configure the port information portion of the circuit ID whose format is *vlan_info - port_info* for each port. The parameter *port info* is a string of up to 32 bytes in length. When a specific value is not configured for port information, the *port_info* defaults to the ASCII representation of the ingress ports's SNMP ifIndex.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information circuit-id vlan-information

```
configure ip-security dhcp-snooping information circuit-id vlan-
   information vlan_info [dynamic | {vlan} vlan_name | all]
```

Description

Configures the *VLAN* info portion of the circuit ID of a VLAN.

Syntax Description

vlan_info	Specifies the circuit ID VLAN information for each VLAN in the format of *VLAN Info-Port Info*; maximum length is 32 bytes.
vlan_name	Specifies the VLAN for which *DHCP* should be enabled.
all	Specifies all VLANs.
dynamic	Configuration options for dynamically created VLANs.

Default

The default value is the ASCII representation of the ingress VLAN's ID.

Usage Guidelines

This command allows you to configure the VLAN information portion of the circuit ID of a VLAN. The VLAN info is a string of characters of up to 32 bytes in length, and is entered in the format of *VLAN InfoPort Info*. When a specific value is not configured for a VLAN, vlan_info defaults to the ASCII representation of the ingress VLAN's ID.

History

This command was first available in ExtremeXOS 12.1.

Dynamic VLAN option added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information option

```
configure ip-security dhcp-snooping information option
```

Description

Enables the *DHCP* relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

The default is unconfigured.

Usage Guidelines

This command enables the DHCP relay agent option (option 82), which is inserted into client-originated DHCP packets before they are forwarded to the server.

To disable the DHCP relay agent option (option 82), use the following command:

```
unconfigure ip-security dhcp-snooping information option
```

Example

The following command enable the DHCP relay agent option:

```
configure ip-security dhcp-snooping information information option
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information policy

```
configure ip-security dhcp-snooping information policy [drop | keep |
   replace]
```

Description

Configures the *DHCP* relay agent option (option 82) policy.

Syntax Description

drop	Specifies to drop the packet.
keep	Specifies to keep the existing option 82 information in place.
replace	Specifies to replace the existing data with the switch's own data.

Default

The default value is replace.

Usage Guidelines

Use this command to set a policy for the relay agent. Packets can be dropped, the option 82 information can be replaced (the default), or the packet can be forwarded with the information unchanged.

Example

The following command configures the DHCP relay agent option 82 policy to keep:

```
configure ip-security dhcp-snooping information information policy keep
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ip-security dhcp-snooping information remote-id

```
configure ip-security dhcp-snooping information remote-id [system-name |
   remote-id_info]
```

Description

Configures the *DHCP* relay agent remote ID.

Syntax Description

remote-id	Specifies configuring the remote ID.
system-name	Specifies assigning the switch's system name as the remote ID.
remote-id_info	Specifies assigning a user-defined string as the remote ID (up to 32 characters).

Default

If neither a system name nor the customized remote ID is configured, the default is the switch's MAC address.

Usage Guidelines

This command specifies setting the remote ID as either the switch's system name (for example, X465-48P) or a user-defined string. If neither selection has been made, or you unconfigure the remote ID (`unconfigure ip-security dhcp-snooping information` **`remote-id`**), the default remote ID is the switch's MAC address. However, this default (MAC address) name does not appear in the `show ip-security dhcp-snooping information` **`remote-id`** command.

Example

The following command configures the DHCP remote ID as the switch's system name::

```
# configure ip-security dhcp-snooping information remote-id system-name
```

The following command configures the DHCP remote ID as "mydhcp":

```
# configure ip-security dhcp-snooping information remote-id mydhcp
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ipv6 dad

```
configure ipv6 dad [off | on | {on} attempts max_solicitations] {{vr}
   vr_name | vr all}
```

Description

Configures the operation of the duplicate address detection (DAD) feature on the specified VR.

Syntax Description

max_solicitations	Specifies the number of times the DAD feature tests for a duplicate address. The range is 1 to 10, and the default value is 1.
vr_name	Specifies a VR on which to enable this feature.

Default

DAD status: On on *VR-Default*.

Maximum solicitations: 1 for VR-Default.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When the DAD feature is enabled, the switch checks for duplicate IPv6 addresses on the specified VR when an IPv6 interface is initialized, or when a DAD check is initiated with a CLI command. After initialization, and when this feature is off, the switch does not start DAD checks.

Changes to the number of solicitations configuration take affect the next time the DAD check is run.

By default, this command applies to the current VR context, if no VR name is specified. If vr all is specified, the command applies to all user VRs and VR-Default.

The DAD feature does not run on loopback VLANs.

Example

The following command enables the DAD feature on all user VRs and VR-Default:

```
configure ipv6 dad on vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ipv6 hop-limit

```
configure ipv6 hop-limit hop_limit {dont-specify-in-ra} {{vr} vr_name |
   {vlan} vlan_name | vlan all}
```

Description

This command allows you to configure the IPv6 hop-limit. This hop-limit is used in all originated IPv6 packets, and (if router discovery is enabled) in outgoing Router Advertisement packets as well.

Syntax Description

hop_limit	Hop limit for all originated IPv6 packets, and the advertised hop-limit for Router Advertisements. Hop limit value is between 1 and 255. Default is 64.
dont-specify-in-ra	Sets the advertised hop-limit in Router Advertisements to zero.
vr	Virtual router.
vlan	*VLAN*.
all	All VLANs.

Default

64.

Usage Guidelines

Use this command to configure the IPv6 hop-limit. The hop-limit is used in all originated IPv6 packets, and (if router discovery is enabled) in outgoing Router Advertisement packets as well.

The 0 value is special and used only in outgoing Router Advertisements to convey to the receiving hosts that the router has not specified a hop-limit value to be used when originating IPv6 packets. This can be configured by specifying the optional **dont-specify-in-ra** keyword. The hop-limit can be configured for a VLAN, all VLANs in a Virtual Router, or all VLANs in the system. By default, the hop-limit is configured for all vlans in the current Virtual Router context of the CLI.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure iqagent http-proxy

```
configure iqagent http-proxy [ipaddress [fqdn | ip_address] port
   port_number | user user_name password [encrypted encrypted_password |
   password] | none]
```

Description

Configures the IQ Agent HTTP Proxy server IP and port, and defines the username and password if required.

Syntax Description

iqagent	Specifies configuring IQ Agent.
http-proxy	Specifies the HTTP proxy server that the IQ Agent uses.
ipaddress	Specifies the HTTP proxy server address.
fqdn	Specifies Fully-qualified domain name. Type is string. Range is 1-255.
ip_address	Specifies the dotted decimal IP Address.
port	Specifies the HTTP proxy port number.
port_number	Specifies the port number.
user	Specifies the HTTP proxy user name.
user_name	Specifies the user name. Type is string. Range is 1-63.
password	Specifies the HTTP proxy password.
encrypted	Specifies that the password is encrypted.
encrypted_password	Specifies the encrypted password (in Base64). Type is string. Range is 16-255.
password	Specifies the password (in ASCII). Type is string. Range is 1-63.
none	Specifies to clear all http-proxy configuration.

Default

N/A.

Usage Guidelines

To view IQ Agent information, use the command `show` **`iqagent discovery`**.

Example

The following example configures the HTTP proxy server at the address 10.51.3.163 on port 3128:

```
# configure iqagent http-proxy ipaddress 10.51.3.163 port 3128
```

The following example configures the HTTP proxy user "iqagent" with an encrypted password:

```
# configure iqagent http-proxy user iqagent password encrypted 35m5wuDryaQLrbQfZ5y4zw==
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure iqagent server

```
configure iqagent server [vr [[vr-name | none] | vr_name vlan-
   name]] | none] | ipaddress [fqdn | ip_address| none]]
```

Description

Configures the optional user-defined virtual router (VR) and address for the server for ExtremeCloud™ IQ Agent to connect to.

Syntax Description

iqagent	Specifies configuring IQ Agent.
server	Specifies configuring IQ server.
vr	Specifies selecting a VR for IQ server.
vr-name	Specifies the name of the VR.
none	Specifies no user-defined VR. Auto-discovery is used instead (default).
vlan	Specifies which VLAN to run on.
vlan-name	Specifies the name of the VLAN.
none	Specifies no user-defined VLAN.
ipaddress	Specifies configuring a server address
fqdn	Specifies a fully-qualified domain name for IQ server.
ip_address	Specifies an IP address for IQ server.
none	Specifies using auto-discovered information from IQ Agent discovery (default).

Default

By default, if no VR is specified, the VR is auto-discovered.

By default, for the server address, auto-discovery is used.

Usage Guidelines

To view IQ Agent information, use the command `show` **`iqagent discovery`**.

Example

The following example configures connecting to IQ server on VR "VR-Mgmt":

```
# configure iqagent server vr VR-Mgmt
```

The following example configures connecting to IQ server at the address 134.141.1.1:

```
# configure iqagent server ipaddress 134.141.1.1
```

The following example unconfigures any user-defined changes and returns to auto-discovery:

```
# configure iqagent server none
```

History

This command was first available in ExtremeXOS 30.7.

The **vlan** option was added in ExtremeXOS 32.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure irdp

```
configure irdp [multicast | broadcast | mininterval maxinterval lifetime
   preference]
```

Description

Configures the destination address of the router advertisement messages.

Syntax Description

multicast	Specifies multicast setting.
broadcast	Specifies broadcast setting.
mininterval	Specifies the minimum time between advertisements.
maxinterval	Specifies the maximum time between advertisements. Default is 600.
lifetime	Specifies the lifetime of the advertisement. Default is 1800.
preference	Specifies the router preference level. Default is 0.

Default

Broadcast (255.255.255.255). The default mininterval is 450.

Usage Guidelines

ICMP Router Discovery Protocol (IRDP) allows client machines to determine what default gateway address to use. The switch sends out IP packets at the specified intervals identifying itself as a default router. IRDP enabled client machines use this information to determine which gateway address to use for routing data packets to other networks.

Example

The following example sets the address of the router advertiser messages to multicast:

```
configure irdp multicast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the *Switch Engine 32.2 Feature License Requirements* document.

configure isis add vlan

```
configure isis add [vlan all | {vlan} vlan_name] area area_name {ipv4 |
   ipv6}
```

Description

This command associates the specified *VLAN* interface with the specified IS-IS router process.

Syntax Description

vlan all	Adds all IS-IS eligible VLANs to the router process.
vlan_name	Specifies a single IS-IS eligible VLAN to be added to the router process.
area_name	Identifies the router process to which the VLANs are added.
ipv4 | ipv6	Specifies the VLAN IP address type, IPv4 or IPv6, to be added. If you do not specify an IP address type, the VLAN is added for the IPv4 address type. To support both IP address types on the same VLAN, enter the command twice, using a different IP address type each time.

Default

IPv4.

Usage Guidelines

An IS-IS-eligible interface is one that already has the appropriate IP address type (IPv4 or IPv6) address assigned to it. The VLAN must have an IPv4 address assigned to it if ipv4 is specified or an IPv6 address assigned to it if ipv6 is specified. In the event that a VLAN address is unconfigured, the interface is automatically removed from the IS-IS router.

VLANs are added to an IS-IS router process to form adjacencies with neighboring IS-IS routers. Hello PDUs are transmitted over these interfaces once the router process is enabled and has a system ID and

area address. IP forwarding, IPv6 forwarding, or both must be enabled on the interface. If the router process operates at both L1 and L2, interfaces can be configured to form adjacencies in only a specific level.

Example

The following command adds VLAN SJvlan with an IPv4 address type to areax:

```
configure isis add SJvlan area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area add area-address

`configure isis area` *area_name* **`add area-address`** *area_address*

Description

This command adds an IS-IS area address to the specified routing process.

Syntax Description

area_name	Specifies the area name of the IS-IS process to which to add the area address.
area_address	Specifies an IS-IS area address to add to the IS-IS process. The area address can be from 1 to 13 bytes long and must be entered in the following format: 0101.0102.0103.0104.0105.0106.07.

Default

None.

Usage Guidelines

The IS-IS area address defines an L1 or L2 area within an AS. An IS-IS routing process must be assigned at least one area address before it can send or process PDUs. The area address must be configured appropriately. Level 1 routers only form adjacencies with other level 1 routers with at least one area address in common. Multiple area addresses may be configured, which may be desirable during a topological transition. The maximum number of area addresses that can be configured is 3.

Example

The following command assigns area address 0011.03 to areax:

```
configure isis area areax add area-address 0011.03
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area add summary-address

```
configure isis area area_name add summary-address [ipv4_address_mask |
   ipv6_address_mask] {level [1 | 2]}
```

Description

This command adds an IPv4 or IPv6 summary address for the specified level on the specified router process.

Syntax Description

area_name	Specifies the router process to which the summary address is to be added.
ipv4_address_mask	Specifies an IPv4 summary address.
ipv6_address_mask	Specifies an IPv6 summary address.
level	Specifies the IS-IS level for the summary address. The level 1 option summarizes level 2 routes leaked to level 1. The level 2 option summarizes level 1 routes that are advertised into level 2.

Default

No summarization.

Usage Guidelines

Route summaries are useful for minimizing the number of LSPs required to describe reachability for an area. The summary address is advertised instead of the actual reachable addresses. This is particularly useful for L1/L2 routers in which the summary address is used in a single LSP instead of including a part or all of the addresses reachable in its level 1 area.

Note that a summary address is only advertised if at least one route matches the summary address. If there is no route present that matches the summary address exactly, a blackhole route is installed for

the summary address. If an interlevel filter permits any route matched by the summary address, and that route is present, the summary address is advertised.

If multiple summary addresses are installed in which one or more supersede each other (10.0.0.0/8 and 10.0.0.0/16, for example), only the more specific summary addresses are advertised.

Example

The following command adds an IPv4 summary address to areax:

```
configure isis area areax add summary-address 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area area-password

```
configure isis area area_name area-password [none | [encrypted
   simple encrypted_password | simple {password} ] {authenticate-snp
   {tx-only}}]
```

Description

This command sets or clears the password for level 1 LSPs.

Syntax Description

area_name	Specifies the router process to which the password configuration applies.
none	Disables level 1 password authentication.
encrypted simple password	Enables password authentication and specifies that the supplied password is encrypted and must be decrypted prior to placement in a TLV.
authenticate-snp tx-only	Enables password authentication and level 1 SNP authentication. If the tx-only keyword is specified, the password is included in SNPs on transmission, but received SNPs are not authenticated.

Default

None.

Usage Guidelines

Only plain text passwords are supported. Passwords may be up to 254 alphanumeric characters in length. Although passwords are plaintext in the protocol, they are displayed and saved in an encrypted form.

When password authentication is enabled, received packets are authenticated against the configured password and are discarded if the password does not match. Authentication TLVs are included in transmitted level 1 LSPs with a configured password.

Example

The following command configures the password extreme for areax:

```
configure isis area areax area-password simple extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area delete area-address

`configure isis area` *area_name* **`delete area-address`** *area_address*

Description

This command deletes an area address from the specified routing process.

Syntax Description

area_name	Specifies the area name of the IS-IS process from which to delete the area address.
area_address	Specifies the area address name to delete from the IS-IS process.

Default

None.

Usage Guidelines

If this router process has only one area address configured, this command also causes the routing process to stop sending or processing IS-IS PDUs.

Example

The following command deletes the 0011.03 area address from areax:

```
configure isis area areax delete area-address 0011.03
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area delete summary-address

```
configure isis area area_name delete summary-address [ipv4_address_mask
   | ipv6_address_mask] {level [1 | 2]}
```

Description

This command removes the specified IPv4 or IPv6 summary address from the specified router process at the specified level.

Syntax Description

area_name	Specifies the router process from which the summary address is to be deleted.
ipv4_address_mask	Specifies an IPv4 summary address.
ipv6_address_mask	Specifies an IPv6 summary address.
level	Specifies the IS-IS level for the summary address.

Default

No summarization.

Usage Guidelines

Individual reachable addresses that were superseded by the summary address are now advertised in separate LSPs.

Example

The following command deletes an IPv4 summary address from areax:

```
configure isis area areax delete summary-address 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area domain-password

```
configure isis area area_name domain-password [none | [encrypted
   simple encrypted_password | simple {password} ] {authenticate-snp
   {tx-only}}]
```

Description

This command sets or clears the password for Level 2 LSPs.

Syntax Description

area_name	Specifies the router process for which the password is set or cleared.
none	Disables level 2 password authentication.
encrypted	Specifies that the supplied password is encrypted and must be decrypted prior to using it in a TLV.
password	Specifies a password. Passwords may be up to 254 alphanumeric characters in length.
authenticate-snp tx-only	If the optional authenticate-snp keyword is included, level 2 SNPs are also authenticated on receive and the password is included on transmission. If tx-only is specified, the password is included in SNPs on transmission, but received SNPs are not authenticated.

Default

None.

Usage Guidelines

Packets received are authenticated against the configured password and are discarded if the password does not match. Authentication TLVs are included in transmitted level 2 LSPs with the configured password. Only plain text passwords are supported. Although LSPs contain plain text passwords, passwords are displayed and saved in an encrypted form.

Example

The following command sets the domain password to Extreme:

```
configure isis area areax domain-password simple Extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area interlevel-filter level 1-to-2

```
configure isis area area_name interlevel-filter level 1-to-2 [policy |
   none] {ipv4 | ipv6}
```

Description

This command provides a method of restricting L1 routes from being redistributed into the L2 domain on an L1/L2 router.

Syntax Description

area_name	Specifies the router process for which this configuration change applies.
policy	Specifies a policy to control how L1 routes are redistributed.
none	Removes any previously configured interlevel filters.
ipv4 | ipv6	Applies the interlevel filter to IPv4 or IPv6. If neither IPv4 nor IPv6 is specified, this command applies to IPv4.

Default

None.

Usage Guidelines

This command has no effect on level 1-only and level 2-only routers. Normally all L1 routes are redistributed into L2 on an L1/L2 router. Routes are permitted unless explicitly denied in the policy. This command does not necessarily disable level 1 to level 2 redistribution unless the configured policy effectively filters out all routes. For policies, the nlri match attribute is supported, and the permit and deny set attributes are supported.

Example

The following command removes any previously configured interlevel filters in areax for IPv4:

```
configure isis area areax interlevel-filter level 1-to-2 none
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area interlevel-filter level 2-to-1

```
configure isis area area_name interlevel-filter level 2-to-1 [policy |
   block-all | allow-all] {ipv4 | ipv6}
```

Description

This command enables route leaking from level 2 to level 1 on an L1/L2 router.

Syntax Description

area_name	Specifies the router process for which this configuration change applies.
policy	Specifies a policy to control how L2 routes are leaked to L1.
block-all	Blocks all route leaking.
allow-all	Leaks all routes into level 1.
ipv4 | ipv6	Applies the interlevel filter to IPv4 or IPv6. If neither IPv4 nor IPv6 is specified, this command applies to IPv4.

Default

block-all.

Usage Guidelines

When a policy is supplied with this command, all routes are leaked unless explicitly denied in the policy. This command has no effect on level 1-only and level 2-only routers. For policies, the nlri match attribute is supported, and the permit and deny set attributes are supported.

Example

The following command configures areax to leak all level 2 routes to level 1 for IPv4:

```
configure isis area areax interlevel-filter level 2-to-1 allow-all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area is-type level

`configure isis area` *area_name* **`is-type level`** [**`1`** | **`2`** | **`both-1-and-2`**]

Description

This command configures the specified router process to operate as a level 1, level 2, or level 1/level 2 router.

Syntax Description

area_name	Specifies the router process you are configuring.
level	Specifies the IS-IS operation level for the router.

Default

both-1-and-2.

Usage Guidelines

Adjacencies are only formed with other routers of the same level. In addition, level 1 adjacencies are only formed with other level 1 routers with the same area address.

If there are no other L2 areas, the default is both-1-and-2. If an L2 or L1/L2 area is already present, the default is L1. This is because there can be only one L2 area in each system.

Example

The following command configures the areax router to operate at level 1:

```
configure isis area areax is-type level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area metric-style

```
configure isis area area_name metric-style [[narrow | wide]
   {transition}] | transition] {level [1 | 2]}
```

Description

This command specifies the metric style for the specified router process and IS-IS level.

Syntax Description

area_name	Specifies the router process for which the metric style is to be configured.
narrow	Specifies the narrow metric style, which uses the 6-bit default metric. Only narrow metrics are encoded in originated TLVs; only narrow SPF calculations are performed.
narrow transition	Specifies the narrow metric style, which uses the 6-bit default metric. Only narrow metrics are encoded in originated TLVs; both narrow and wide SPF calculations are performed.
wide	Specifies the wide metric style, which uses the 24-bit metric specified in RFC 3784. Only wide metrics area encoded in originated TLVs; only wide SPF calculations are performed.
wide transition	Specifies the wide metric style, which uses the 24-bit metric specified in RFC 3784. Only wide metrics are encoded in originated TLVs; both narrow and wide SPF calculations are performed.
transition	Specifies both the narrow and wide metrics. Both narrow and wide metric types are encoded in TLVs; both narrow and wide SPF calculations are performed.
level	Specifies the IS-IS level to which the metric style applies.

Default

Narrow.

Usage Guidelines

Refer to RFC 3787, Section 5.1, for information on how to migrate a network from narrow metric-style to wide metric-style. Note that Section 5.2 is not supported. As a result, each interface's narrow and wide metric values must match while transitioning the metric style. Only when the entire network

has transitioned to wide metric style should the interface metrics be configured differently than the configured narrow metric.

Example

The following command configures areax for the narrow metric style:

```
configure isis area areax metric-style narrow
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area overload-bit on-startup

```
configure isis area area_name overload-bit on-startup [ off | {suppress
   [external | interlevel | all]} seconds]
```

Description

This command enables or disables the overload bit feature while the specified IS-IS process is initializing.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be enabled or disabled.
off	Disables the overload bit feature during initialization.
suppress	Specifies that one or all types of reachability information is to be suppressed or excluded from LSPs during initialization.
external	When included with the suppress option, this specifies that external reachability information is to be excluded from LSPs during initialization.
interlevel	When included with the suppress option, this specifies that interlevel reachability information is to be excluded from LSPs during initialization.
all	When included with the suppress option, this specifies that external and interlevel reachability information is to be excluded from LSPs during initialization.
seconds	Specifies the period (in seconds) during which this feature is enabled at initialization.

Default

Off.

Usage Guidelines

This command configures the overload bit to be set only while the configured router is initializing, and only for the period of time specified. This can be useful to minimize network churn while a new router joins and learns the topology. The suppress options are used during startup if the router process is level 1/level 2 or is running another protocol, such as *BGP* (in order to wait for the other protocol to converge). Note that in the latter case, there is no signaling between protocols to indicate convergence. Again, this can reduce churn while the topologies are learned during router initialization.

Note

Although `enable isis area area_name overload-bit {suppress [external | interlevel | all]}` and `disable isis area area_name overload-bit` override the overload bit behavior configured by the `configure isis area area_name overload-bit on-startup [ off | {suppress [external | interlevel | all]}seconds]` command, the enable and disable commands do not modify the configured parameters.

Example

The following command enables the areax overload bit feature for 15 seconds during initialization:

```
configure isis area areax overload-bit on-startup 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area system-id

`configure isis area area_name system-id [automatic | system_id]`

Description

This command configures the system ID for an IS-IS router process.

Syntax Description

area_name	Specifies the area name of the IS-IS process to which to add the system ID.
automatic	Sets the system ID to the system MAC address.
system_id	Specifies the 6-byte system ID using three sets of four hexadecimal digits, where each set is separated by a period. For example: 001B.1F62.1201.

Default

Automatic (system MAC address is used).

Usage Guidelines

The system ID must be a unique ID within the AS. Typically a system MAC address is used as the system ID. Sometimes a combination of one of the router's IP addresses and 2 prefix bytes are used. The assignment of the system ID may vary depending on how the AS is chosen to be administered.

Example

The following example configures an IS-IS system ID for areax:

```
configure isis area areax system-id 001B.1F62.1201
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area timer lsp-gen-interval

configure isis area *area_name* **timer lsp-gen-interval** *seconds* {**level**[**1**|**2**]}

Description

This command configures the minimum time required to wait before regenerating the same LSP.

Syntax Description

area_name	Specifies the router process for which you want to configure the LSP generation interval.
seconds	Specifies the generation level in seconds. The range is 1 to 120 seconds.
level	Specifies the level to which you want to apply the configuration. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

30 seconds.

Usage Guidelines

In link flapping situations in a mesh network, this can greatly reduce the amount of network traffic generated from LSP flooding.

Example

The following command sets the LSP generation interval to a value of 40 seconds:

```
configure isis area areax timer lsp-gen-interval 40
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area timer lsp-refresh-interval

`configure isis area` *area_name* **`timer lsp-refresh-interval`** *seconds*

Description

This command configures the refresh rate for locally originated LSPs.

Syntax Description

area_name	Specifies the router process for which you are setting the LSP refresh timer.
seconds	Specifies the LSP refresh interval. The range is 1 to 65535 seconds.

Default

900 seconds.

Usage Guidelines

This value should be configured to be less than the maximum LSP lifetime value, which is set with the `configure isis area area_name timer max-lsp-lifetimeseconds` command. Locally originated LSPs are purged and retransmitted at the specified interval regardless of link state.

Example

The following command sets the LSP refresh timer for areax to 1200 seconds:

```
configure isis area areax timer lsp-refresh-interval 1200
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area timer max-lsp-lifetime

`configure isis area area_name` **`timer max-lsp-lifetime`** *`seconds`*

Description

This command configures the LSP lifetime timer for locally originated LSPs.

Syntax Description

area_name	Specifies the router process for which you want to configure the LSP lifetime timer.
seconds	Specifies the LSP lifetime in seconds. The range is 1 to 65535 seconds.

Default

1200 seconds.

Usage Guidelines

This value should be configured to be greater than the LSP refresh interval, which is set with the `configure isis area area_name timer lsp-refresh-intervalseconds` command.

The remaining lifetime value is included in LSPs when they are flooded. Routers age out LSPs from other routers using the remaining lifetime provided in the LSP. If a refreshed version of the LSP is not received before it is aged out, an SPF recalculation occurs, possibly resulting in routing around the router from which the LSP originated.

Example

The following command configures the LSP lifetime timer for 1800 seconds:

```
configure isis area areax timer max-lsp-lifetime 1800
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area timer restart

configure isis area *area_name* **timer restart** *seconds* {**level** [**1** | **2**]}

Description

This command configures the IS-IS T2 timer for the specified router process and level.

Syntax Description

area_name	Specifies the router process for which the T2 timer configuration applies.
seconds	Specifies the T2 timer value. The range is 5 to 65535 seconds.
level	Specifies the IS-IS level to which this timer configuration applies. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

60 seconds.

Usage Guidelines

The T2 timer is the restart timer for the LSP database for an IS-IS level. If the T2 timer for the respective level expires before the database has been resynchronized, SPF is run for that level.

Example

The following command configures the areax level 1 T2 timer for 90 seconds:

```
configure isis area areax timer restart 90 level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area timer spf-interval

configure isis area *area_name* **timer spf-interval** *seconds* {**level**[**1**|**2**]}

Description

This command specifies the minimum time to wait between SPF calculations.

Syntax Description

area_name	Specifies the router process for which you are configuring the SPF interval.
seconds	Specifies the minimum time between SPF calculations. The range is 1 to 120 seconds.
level	Specifies the IS-IS level to which the timer configuration applies. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

This helps prevent switch CPU overloading when a link flap causes several back-to-back SPF calculations.

Example

The following command configures the SPF interval timer for 30 seconds on areax:

```
configure isis area areax timer spf-interval 30
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis area topology-mode

```
configure isis area area_name topology-mode [single | multi |
   transition] {level [1 | 2]}
```

Description

This command enables or disables use of multi-topology TLVs as specified in draft-ietf-isis-wg-multi-topology-11.

Syntax Description

area_name	Specifies the router process to be configured.
single	Specifies a single topology, where extended TLVs are used in SPF calculation and TLVs.
multi	Specifies a multi topology, where only the multi-topology TLVs are used in SPF calculation and TLVs.
transition	Specifies a transition topology, where both extended and multi-topology TLVs are used in SPF calculation and TLVs. The transition option is useful when migrating a routing domain.
level	For L1/L2 routers, this applies the configuration to IS-IS level 1 or level 2. If the level option is not specified, the configuration applies to both L1 and L2 areas. This option has no affect on L1-only and L2-only routers.

Default

Single.

Usage Guidelines

Multi-topology capability is desirable if both an IPv4 topology and an IPv6 topology exist with different routing paths.

Extreme supports MT IDs 0 and 2 (IPv4 unicast and IPv6 unicast) only.

Example

The following command configures the transition topology mode for areax:

```
configure isis area areax topology-mode transition
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis circuit-type

```
configure isis [vlan all | {vlan} vlan_name] circuit-type level [1 | 2 |
   both-1-and-2]
```

Description

This command configures the circuit type level for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the selected circuit type to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the circuit type configuration applies.
level [1 | 2 | both-1-and-2]	Sets the circuit type level to level 1, level 2, or to both level 1 and level 2.

Default

Both-1-and-2.

Usage Guidelines

Hello PDUs are only sent on the specified level for the selected VLANs. This can be useful for level 1/level 2 routers that are neighbors.

Note that for per-level VLAN configurable parameters L1 and L1/L2, point-to-point interfaces use the level 1 parameters, and L2-only point-to-point interfaces use the L2 parameters.

Example

The following command configures all IS-IS VLANs to use circuit type level 1:

```
configure isis vlan all circuit-type level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis delete vlan

```
configure isis delete [vlan all | {vlan} vlan_name] {area area_name}
   {ipv4 | ipv6}
```

Description

This command removes a *VLAN* interface from the specified router process.

Syntax Description

vlan all	Deletes all IS-IS VLANs.
vlan_name	Specifies a single VLAN to delete.
area_name	Specifies the router process from which the VLAN is deleted. If you do not specify an IS-IS area, the software deletes the VLAN from the configured IS-IS area.
ipv4 | ipv6	Specifies the IP address type for which the VLAN is deleted. If you do not specify an IP address type, the VLAN for the IPv4 address type is deleted. If the VLAN was added as IPv6, the ipv6 option must be used to remove the VLAN. If the VLAN was added as both IPv4 and IPv6, each VLAN IP address type must be deleted with a separate command.

Default

N/A.

Usage Guidelines

The associated adjacency is removed, causing the removal of the corresponding LSP if there is one, and causing an SPF recalculation if the router process is enabled. Hello PDUs are no longer sent on the specified interface. This command applies to IS-IS-enabled VLANs only.

Example

The following command deletes the IPv4 address type for all VLANs in areax:

```
configure isis delete vlan all area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis hello-multiplier

```
configure isis [vlan all | {vlan} vlan_name] hello-multiplier multiplier
   {level [1 | 2]}
```

Description

This command sets the hello multiplier for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
multiplier	Sets the hello multiplier. The range is 2 to 100.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

3.

Usage Guidelines

The hello multiplier is used in conjunction with the hello interval to compute the holding time. The holding time is included in hello PDUs and is calculated by multiplying the hello multiplier by the hello interval. If the hello interval is set to minimal, the holding time is set to 1 second and the hello interval is calculated by dividing 1 second by the hello multiplier. For example, a hello interval of minimal and a hello multiplier of 4 means that the hold interval is set to 250 ms (and the holding time to 1 second). The holding time tells the neighboring router how long to wait before declaring the sending router dead.

Example

The following command sets the SJvlan hello multiplier to 4:

```
configure isis SJvlan hello-multiplier 4
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis import-policy

```
configure isis import-policy [policy-map | none]
```

Description

This command applies a policy map for routes imported to the FIB from all IS-IS router processes on this virtual router.

Syntax Description

policy-map	Specifies the policy to apply.
none	Removes any policies assigned to this virtual router.

Default

None.

Usage Guidelines

IS-IS policy files support the following policy match conditions:

- `nlri` *IPv4-address/mask-len IPv6-address/mask-len*
- `route-origin [isis-level-1 | isis-level-2 | isis-level-1-external | isis-level-2-external]`

IS-IS policy files support the following policy action statements:

- `cost`

Example

The following command applies the IS-IS policy policy2 to the virtual router:

```
configure isis import-policy policy2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis link-type

```
configure isis [vlan all | {vlan} vlan_name] link-type [broadcast |
   point-to-point]
```

Description

This command specifies the link type for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the link type configuration to all IS-IS VLANs.
vlan_name	Specifies a single IS-IS VLAN to which the link type configuration is applied.
broadcast	Selects the broadcast link type for the specified VLANs.
point-to-point	Selects the point-to-point link type for the specified VLANs.

Default

Broadcast.

Usage Guidelines

On broadcast interfaces, a DIS is elected. There is no DIS election on point-to-point interfaces. If it is known that only two routers will be present on a physical network, it may be desirable to set their connecting interfaces to point-to-point mode. This reduces the overhead associated with DIS election and periodic CSNP transmissions and processing. In addition, if the adjacency is both level 1 and level 2, only one set of hello PDUs are sent on a point-to-point interface whereas hello PDUs are sent for both levels on broadcast interfaces. Interfaces in point-to-point mode must have an IP address assigned to them. Unnumbered interfaces are not supported.

For point-to-point interfaces, level 1 parameters apply to L1-only and L1/L2 interfaces. Level 2 parameters apply to L2-only point-to-point interfaces.

Example

The following command configures all IS-IS VLANs to use the broadcast link type:

```
configure isis vlan all link-type broadcast
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis mesh

```
configure isis [vlan all | {vlan} vlan_name] mesh [block-none | block-
   all | block-group group_id]
```

Description

This command configures LSP flooding behavior for the specified interface.

Syntax Description

vlan all	Applies the configuration to all IS-IS *VLANs*.
vlan_name	Specifies a single VLAN to which the configuration applies.
block-none	Disables LSP blocking.
block-all	Blocks all LSPs. No LSPs are flooded out of the selected interface.
block-group	Blocks LSPs that contain the specified group ID.
group_id	Specifies a group ID number. The range is 1 to 4294967295.

Default

Block-none.

Usage Guidelines

In a mesh environment, which is a set of fully interconnected point-to-point interfaces, LSP flooding can generate N2 PDUs because no router can tell which routers have and have not received the flooded LSP. By carefully selecting the links over which LSPs are flooded, traffic can be greatly reduced at the

cost of some resiliency. Using mesh group IDs instead of a full block (the block-all option) allows a finer granularity of control.

Example

The following command configures blocking on SJvlan for group 5:

```
configure isis SJvlan mesh block-group 5
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis metric

configure isis [**vlan all** | {**vlan**} *vlan_name*] **metric** *metric* {**level**[**1**|**2**]}

Description

This command sets the narrow metric for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
metric *metric*	Sets the metric value. The range is 1 to 63.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10.

Usage Guidelines

If narrow metrics are enabled, this value is used in the associated LSPs for the selected VLANs.

Example

The following command sets the narrow metric for all IS-IS VLANs to 15:

```
configure isis vlan all metric 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis password vlan

```
configure isis [vlan all | {vlan} vlan_name] password [none | encrypted
   simple encrypted_password | simple { password }] [level [1|2]]
```

Description

This command sets or clears the authentication password for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the password configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the password configuration is applied.
none	Clears the password configuration and disables hello PDU authentication.
encrypted	Specifies that the supplied password is encrypted and must be decrypted prior to using it in a TLV.
password	Specifies the password. Passwords may be up to 254 alphanumeric characters in length.
level [1 | 2]	Limits the password configuration to level 1 or level 2. If neither level 1 or level 2 is specified, the configuration applies to both levels.

Default

None.

Usage Guidelines

If configured, the specified password is included in Hello PDUs for the specified level. In addition, received Hello PDUs on the specified interface are authenticated with the same password. Hello PDUs that are not authenticated are discarded.

Only plain text passwords are supported. Note that if the password is changed on an interface with an existing adjacency, the neighboring router needs to be configured as well. Depending on how timers are configured, the adjacency may time out while transitioning between passwords. Although passwords appear in plain text during configuration, they are displayed and saved in encrypted form.

Example

The following command assigns password Extreme to all level 1 VLANs configured for IS-IS:

```
configure isis vlan all password simple Extreme level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis priority

```
configure isis [vlan all | {vlan} vlan_name] priority priority {level[1
    | 2]}
```

Description

This command sets the priority used for DIS election on broadcast interfaces.

Syntax Description

vlan all	Applies the configuration to all IS-IS *VLANs*.
vlan_name	Specifies a single VLAN to which the configuration applies.
priority priority	Sets the priority value. The range is 0 to 127.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

64.

Usage Guidelines

A higher priority value is preferred over a lower priority value. The priority is encoded in level 1 or level 2 hello PDUs. This command is not valid for point-to-point interfaces. Note that a priority of 0 has no

special meaning other than the fact that it is the lowest priority. A router with a priority of 0 can still become the DIS.

Example

The following command configures priority level 32 for SJvlan:

```
configure isis SJvlan priority 32
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis restart grace-period

```
configure isis restart grace-period seconds
```

Description

This command configures the T3 global restart timer for all IS-IS router processes on the current virtual router.

Syntax Description

seconds	Specifies the restart grace period in seconds. The range is 1 to 65535 seconds.

Default

65535.

Usage Guidelines

If the grace period expires before LSP resynchronization is complete, the virtual router sets the overload bit in LSPs that it originates.

Example

The following command sets the restart grace period to 5000 seconds:

```
configure isis restart grace-period 5000
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis restart

```
configure isis restart [ none | planned | unplanned | both ]
```

Description

This command configures IS-IS graceful restart behavior.

Syntax Description

none	Disables IS-IS graceful restart. When graceful restart is disabled, this router still operates as a helper to other restarting routers.
planned	Initiates IS-IS graceful restart only in response to the restart process isis.
unplanned	Initiates graceful restart only when the IS-IS process is restarted due to a process crash or an unplanned failover.
both	Initiates graceful restart for all events supported by the planned and unplanned options.

Default

None.

Usage Guidelines

The command options specify under which circumstances graceful restart is to be performed. This command has no effect during normal switch boot up. All IS-IS routing processes in the current virtual router are affected by this command.

All neighboring routers must support IS-IS restart in order for graceful restart to work. If graceful restart is not performed after a process restart or failover, the router's adjacencies are re-initialized causing SPF recalculation throughout the network and, if the overload bit is not configured to be set during startup, churn as adjacencies change state and LSPs are learned.

Note

The planned and unplanned command options do not affect the actual restart protocol operation of IS-IS; they only determine when the restart process occurs.

Example

The following command configures the switch to initiate a graceful restart for all events supported by the planned and unplanned options:

```
configure isis restart both
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis timer csnp-interval

```
configure isis [vlan all | {vlan} vlan_name] timer csnp-interval seconds
   {level [1 | 2]}
```

Description

This command sets the minimum time between consecutive CSNP transmissions on the specified interface.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS *VLAN*s.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Sets the timer interval. The range is 1 to 65535 seconds.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

Periodic CSNPs are only sent on broadcast interfaces and only by the DIS.

Example

The following command sets the CSNP interval time for all IS-IS VLANs to 15 seconds:

```
configure isis vlan all timer csnp-interval 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis timer hello-interval

```
configure isis [vlan all | {vlan} vlan_name] timer hello-interval
   [seconds | minimal] {level [1 | 2]}
```

Description

This command sets the interval between two consecutive hello transmissions.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS *VLAN*s.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Sets the timer interval. The range is 1 to 65535 seconds.
minimal	Specifies that the hello interval is calculated by dividing 1 second by the hello multiplier.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

If this router is the elected DIS, hellos are sent three times more frequently than the configured interval.

When the timer configuration is set to minimal, the holding time included in the PDU is set to 1 second. Otherwise, the holding time is computed by multiplying the hello interval by the hello multiplier. The holding time tells the neighboring router how long to wait before declaring the sending router dead.

Example

The following command sets the hello interval timer for all VLANs to 15 seconds:

```
configure isis vlan all timer hello-interval 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis timer lsp-interval

```
configure isis [vlan all | {vlan} vlan_name] timer lsp-interval
   milliseconds
```

Description

This command sets the minimum time between LSP transmissions.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS *VLAN*s.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
milliseconds	Specifies the timer value. The range is 1 to 4294967295 milliseconds.

Default

33 milliseconds.

Usage Guidelines

This is used to throttle LSP flooding. Higher values reduce network traffic and can help keep underpowered routers from becoming overloaded during network events. Lower values speed up convergence.

Example

The following command sets the minimal LSP interval for IS-IS VLANs to 66 milliseconds:

```
configure isis vlan all timer lsp-interval 66
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis timer restart-hello-interval

```
configure isis [vlan all | {vlan} vlan_name] timer restart-hello-
   interval seconds {level [1 | 2]}
```

Description

This command configures the T1 restart retransmit timer for one or all *VLAN*s.

Syntax Description

vlan all	Specifies that the T1 restart timer configuration applies to all VLANs.
vlan_name	Specifies a VLAN to which the T1 restart timer configuration applies.
seconds	Specifies the T1 restart timer value. The range is 1 to 65535 seconds.
level [1 | 2]	Limits the configuration change to level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

3 seconds.

Usage Guidelines

If, after sending a restart request, the router process associated with this interface does not receive a restart acknowledgement and a CSNP within the period specified by this command, another restart request is sent.

Example

The following command sets the T1 restart timer to 6 seconds on all level 1 VLANs:

```
configure isis vlan all timer restart-hello-interval 6 level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis timer retransmit-interval

```
configure isis [vlan all | {vlan} vlan_name] timer retransmit-interval
   seconds
```

Description

This command sets the time to wait for an acknowledgement of a transmitted LSP on a point-to-point interface.

Syntax Description

vlan all	Applies the timer value to all IS-IS *VLAN*s.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Defines the timer value. The range is 0 to 65535 seconds.

Default

5 seconds.

Usage Guidelines

If an acknowledgement is not received when the timer expires, the LSP is resent and the timer is reset.

Example

The following command sets the retransmit interval for the SJvlan to 10 seconds:

```
configure isis SJvlan timer retransmit-interval 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure isis wide-metric

```
configure isis [vlan all | {vlan} vlan_name] wide-metric metric {level[1
   | 2]}
```

Description

This command sets the wide metric value for one or all IS-IS *VLAN*s.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
metric	Sets the metric. The range is 1 to 16777214.
level [1 | 2]	Limits the configuration change to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10.

Usage Guidelines

If the wide metric style is enabled on the associated IS-IS router process, the wide metric value is used in Extended IP reachability TLVs, Extended IS Reachability TLVs, and IPv6 Reachability TLVs in LSPs.

Example

The following command sets the wide metric to 15 for all IS-IS VLANs:

```
configure isis vlan all wide-metric 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Premier license as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure jumbo-frame-size

```
configure jumbo-frame-size framesize
```

Description

Sets the maximum jumbo frame size for the switch.

Syntax Description

framesize	Specifies a maximum transmission unit (MTU) size for a jumbo frame. The range is 1523 to 9216; the default is 9216.

Default

Jumbo frames are disabled by default. The default size setting is 9216.

Usage Guidelines

Jumbo frames are used between endstations that support larger frame sizes for more efficient transfers of bulk data. Both endstations involved in the transfer must be capable of supporting jumbo frames.

The framesize keyword describes the maximum jumbo frame size "on the wire," and includes 4 bytes of cyclic redundancy check (CRC) plus another 4 bytes if 802.1Q tagging is being used.

To enable jumbo frame support, you must configure the maximum transmission unit (MTU) size of a jumbo frame that will be allowed by the switch.

Note

Extreme Networks recommends that you set the MTU size so that fragmentation does not occur.

Some network interface cards (NICs) have a configured maximum MTU size that does not include the additional 4 bytes of CRC. Ensure that the NIC maximum MTU size is at or below the maximum MTU size configured on the switch. Frames that are larger than the MTU size configured on the switch are dropped at the ingress port.

Example

The following command configures the jumbo frame size to 5500:

```
configure jumbo-frame-size 5500
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure keychain accept-tolerance

`configure keychain` *keychain_name* **`accept-tolerance`** *seconds*

Description

This command configures a keychain accept tolerance in seconds.

Syntax Description

keychain_name	Specifies the name of the keychain.
accept-tolerance	Specifies the length of time an expired key can be accepted for received packets.
seconds	Specifies the tolerance in seconds. Range is 0-600 (default is 0).

Default

The default is 0, no tolerance.

Usage Guidelines

Use this command to configure a keychain accept tolerance.

Example

The following command configures the keychain accept tolerance:

```
configure keychain accept-tolerance 55
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure keychain add key

```
configure keychain keychain_name add key key_id key-string [text_string
   {active-lifetime {local} start start_time [end end_time | [duration
   [seconds | maximum]]]} | encrypted encrypted_string]
```

Description

This command configures a key to add to a keychain.

Syntax Description

keychain_name	Specifies the name of the keychain.
add	Specifies adding a key to the keychain.
key	Authentication key entry.
key_id	Specifies the unique identifier within a keychain. Range is 1-65535.
key-string	Specifies the shared secret text string for the key.
text_string	Specifies the string. Range is 1-127.
active-lifetime	Specifies the time period the key will be active.
local	Specifies the time in the local time zone instead of UTC.
start	Specifies the start of the time period.
start_time	Specifies the date and time the key will become active. Format is YYYY-MM-DDThh:mm:ss.
end	Specifies the end of the time period.
end_time	Specifies the date and time the key will stop being active. Format is YYYY-MM-DDThh:mm:ss.
duration	Specifies the length of time the key will be active.
seconds	Specifies the duration in seconds. Range is 1-15552000.
maximum	Specifies that the key will be active for 180 days from the start time.
encrypted	Specifies the key string in encrypted form.
encrypted_string	Specifies the encrypted string.

Default

N/A

Usage Guidelines

A maximum of 8 keys can be added to a keychain.

The maximum length of a key string is 127 characters.

The maximum validity period of a key is 180 days.

Example

The following command configures the keychain to add an OSPFv3 key:

```
create keychain ospfv3-keys1
```

The following command adds a key string to the keychain:

```
configure keychain ospfv3-keys1 add key 3 key-string auth3
```

The following command adds additional options to the keychain:

```
configure keychain ospfv3-keys1 add key 1 key-string auth1 active-lifetime local start
2021-06-01T00:00:00 end 2021-07-01T00:00:00
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure keychain delete key

configure keychain *keychain_name* **delete key** *key_id*

Description

This command deletes a key to add to a keychain.

Syntax Description

keychain_name	Specifies the name of the keychain.
delete	Specifies deleting a key from the keychain.
key	Authentication key entry.
key_id	Specifies the unique identifier within a keychain. Range is 1-65535.

Default

N/A

Usage Guidelines

Use this command to delete a key from a configured keychain.

Example

The following command deleetes a key:

```
configure keychain ospfv3-keys1 delete key 3
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure keychain key active-lifetime

```
configure keychain keychain_name key key_id active-lifetime {local}
   start start_time [end end_time | [duration [seconds | maximum]]]
```

Description

This command configures the time period a key will be active.

Syntax Description

keychain_name	Specifies the name of the keychain.
key	Authentication key entry.
key_id	Specifies the unique identifier within a keychain. Range is 1-65535.
active-lifetime	Specifies the time period the key will be active.
local	Specifies the time in the local time zone instead of UTC.
start	Specifies the start of the time period.
start_time	Specifies the date and time the key will become active. Format is YYYY-MM-DDThh:mm:ss.
end	Specifies the end of the time period.
end_time	Specifies the date and time the key will stop being active. Format is YYYY-MM-DDThh:mm:ss.
duration	Specifies the length of time the key will be active.
seconds	Specifies the duration in seconds. Range is 1-15552000.
maximum	Specifies that the key will be active for 180 days from the start time.

Default

N/A.

Usage Guidelines

Use this command to configure the time period a key will be active.

Example

The following command configures the keychain active lifetime:

```
configure keychain ospfv3-keys1 key 3 active-lifetime local start 2021-08-01T00:00:00 end
2021-09-01T00:00:00
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure keychain key hash-altorithm

```
configure keychain keychain_name key key_id hash-algorithm algorithm
```

Description

This command configures a keychain key hash-algorithm.

Syntax Description

keychain_name	Specifies the name of the keychain.
key	Specifies the authentication key entry.
key_id	Specifies the unique identifier within a keychain. Range is 1-65535.
hash-algorithm	Specifies the hash algorithm to be used for the key.
algorithm	Specifies the supported algorithms (default is hmac-sha-256).

Default

The default algorithm is hmac-sha-256.

Usage Guidelines

Use this command to specify the hash algorithm to be used for the key.

Example

The following command configures the keychain hash algorithm:

```
configure keychain ospfv3-keys1 key 2 hash-algorithm hmac-sha-512
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure l2pt profile add profile

```
configure l2pt profile profile_name add protocol filter filter_name
   {action [tunnel {cos cos} {dscp dscp_value {replace}} | encapsulate
   | none]}
```

Description

Adds an entry to an L2PT profile.

Syntax Description

profile *profile_name*	Specifies the profile that defines L2PT configuration for L2 protocols.
add protocol filter *filter_name*	Adds the specified Layer 2 protocol filter.
action	Specifies the action to perform on PDUs of the protocol (the default value is tunnel).
tunnel	Specifies to tunnel PDUs through the network.
cos *cos*	Specifies to override the class of service for tunneled PDUs, and specifies the class of service value to use for tunneling PDUs.
dscp	Specifies to set DSCP in the outer IP header when tunneled over VXLAN network.
dscp_value	Specifies the DSCP value to use in the outer IP header when the inner IP header is not present or when the **replace** is specified (default is 0). Range is 0-63.
replace	Specifies to replace the DSCP in the outer IP header with the configured value (default is do not replace, copy the inner DSCP to the outer header).
encapsulate	Specifies to encapsulate PDUs at egress, and decapsulate L2PT packets at ingress.
none	Specifies to not participate in tunneling for this protocol.

Default

Disabled.

The default *dscp_value* is 0.

The default **replace** is to not replace the DSCP.

Usage Guidelines

Use this command to add an entry to an L2PT profile.

Example

The following example adds an entry to my_l2pt_prof to tunnel protocols in "mylistt" at cos 2:

```
configure l2pt profile my_l2pt_prof add protocol filter mylist action tunnel cos 2
```

The following example adds an entry to my_l2pt_prof to encapsulate/decapsulate protocols in "mylist":

```
configure l2pt profile my_l2pt_prof add protocol filter mylist action encapsulate
```

The following example adds an entry to my_l2pt_prof that is in use by 2 services:

```
configure l2pt profile my_l2pt_prof add protocol filter mylist
```

The following example configures a DSCP value to be set in the outer IP header when the inner DSCP is not present:

```
configure l2pt profile "vxlan_cdp" add protocol filter cdp action tunnel dscp 2
```

The following example copies the inner DSCP to the outer header when the inner DSCP is present:

```
configure l2pt profile "vxlan_cdp" add protocol filter cdp action tunnel dscp 3
```

The following example overrides the outer DSCP (even if the inner DSCP is present):

```
configure l2pt profile "vxlan_cdp" add protocol filter cdp action tunnel dscp 2 replace
```

History

This command was first available in ExtremeXOS 15.5.

Support for DSCP on VXLAN supported platforms was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure l2pt profile delete profile

```
configure l2pt profile profile_name delete protocol filter filter_name
```

Description

Deletes an entry to an L2PT profile.

Syntax Description

profile *profile_name*	Specifies the profile that defines L2PT configuration for L2 protocols.
delete protocol filter *filter_name*	Deletes the specified Layer 2 protocol filter.

Default

Disabled.

Usage Guidelines

Use this command to delete an entry to an L2PT profile.

Example

The following example deletes the entry for "mylist" from my_l2pt_prof:

```
configure l2pt profile my_l2pt_prof delete protocol filter mylist
```

The following example deletes the entry entry for "mylist" from my_l2pt_prof that is in use by a service:

```
configure l2pt profile my_l2pt_prof delete protocol filter mylist
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure l2vpn add peer

```
configure l2vpn [vpls vpls_name | vpws vpws_name] add peer ipaddress
   {{core {full-mesh | primary | secondary} | spoke}
```

Description

Configures a VPLS, H-VPLS, or VPWS peer for the node you are configuring.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
vpws_name	Specifies the VPWS for which you are configuring a peer.
ipaddress	Specifies the IP address of the peer node.
core	Specifies that the peer is a core node. This option applies only to VPLS peers.
full-mesh	Specifies that the peer is a core full-mesh node. This is the default setting if neither the core or spoke options are specified. This option applies only to VPLS peers.
primary	Specifies that the peer is an H-VPLS core node and configures a primary H-VPLS connection to that core node. This option applies only to H-VPLS peers.

secondary	Specifies that the peer is an H-VPLS core node and configures a secondary H-VPLS connection to that core node. This option applies only to H-VPLS peers.
spoke	Specifies that the peer is a H-VPLS spoke node. This option applies only to H-VPLS peers.

Default

N/A.

Usage Guidelines

Each VPLS or H-VPLS node supports up to 64 peers, and each VPWS supports one peer. H-VPLS core nodes can peer with other core nodes and/or spoke nodes. H-VPLS spoke nodes can peer with core nodes but not with other spoke nodes.

VPLS core nodes must be configured in a full-mesh with other core nodes. Thus, all core nodes in the VPLS must have a configured PW to every other core node serving this VPLS. By default, the best LSP is chosen for the PW. The underlying LSP used by the PW can be configured by specifying the named LSP using the CLI command `configure l2vpn [vpls vpls_name | vpws vpws_name] peer ipaddress [add | delete] mpls lsp lsp_name`.

H-VPLS spoke nodes establish up to two point-to-point connections to peer with core nodes. If both primary and secondary peers are defined for a spoke node, the spoke node uses one of the peers for all communications. If both peers are available, the spoke node uses the connection to the primary peer. If the primary peer connection fails, the spoke node uses the secondary peer. If the primary peer later recovers, the spoke node reverts back to using the primary peer.

VPWS nodes establish a point-to-point connection to one peer.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS peer. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS peer. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command adds a connection from the local core switch to the core switch at 1.1.1.202:

```
configure l2vpn vpls vpls1 add peer 1.1.1.202
```

The following command adds a connection from the local core switch to the spoke switch at 1.1.1.201:

```
configure l2vpn vpls vpls1 add peer 1.1.1.201 spoke
```

The following command adds a primary connection from the local spoke switch to the core switch at 1.1.1.203:

```
configure l2vpn vpls vpls1 add peer 1.1.1.203 core primary
```

The following command adds a VPWS connection from the local node to the peer switch at 1.1.1.204:

```
configure l2vpn vpws vpws1 add peer 1.1.1.204
```

History

This command was first available in ExtremeXOS 11.6.

Support for H-VPLS was first available in ExtremeXOS 12.1.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn add service

```
configure l2vpn [vpls vpls_name | vpws vpws_name] add service [{vlan}
   vlan_name | {vman} vman_name]
```

Description

Adds a *VLAN* or VMAN service to a VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string).
vpws_name	Identifies the VPWS interface within the switch (character string).
vlan_name	Logically binds the VLAN to the specified VPLS or VPWS.
vman_name	Adds the named VMAN to the VPLS or VPWS.

Default

N/A.

Usage Guidelines

Only one VLAN or VMAN can be configured per VPLS or VPWS.

When a VLAN service is added to a VPLS or VPWS, the VLAN ID is locally significant to the switch. Thus, each VLAN VPLS or VPWS interface within the Layer 2 VPN can have a different VLAN ID. This greatly simplifies VLAN ID coordination between metro network access points. Traffic may be switched locally between VLAN ports if more than one port is configured for the VLAN.

When a VMAN service has been configured for a VPLS or VPWS, the VMAN ID is locally significant to the switch. Thus, each VMAN VPLS or VPWS interface within the Layer 2 VPN can have a different VMAN ID, just like the VLAN service. The only difference is that the Layer 2 VPN overwrites the outer VMAN tag on Layer 2 VPN egress and leaves the inner VLAN tag unmodified. Because the inner VLAN tag is considered part of the customer packet data, the VMAN service can be used to emulate port-based services. This is accomplished by configuring the Layer 2 VPN to strip the 802.1Q tag from the tunneled packet. Since the switch inserts the VMAN tag when the packet is received and the 802.1Q tag is stripped before the packet is sent on the VPLS or VPWS PW, all packets received on ports that are members of the VMAN are transmitted unmodified across the Layer 2 VPN. The command `configure l2vpn [vpls vpls_name | vpws vpws_name] dot1q tag exclude` is used to configure the switch to strip the 802.1Q tag on the VPLS.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when adding a service to VPWS. For backward compatibility, the l2vpn keyword is optional when adding a service to VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The example below adds a VLAN and a VMAN to the named VPLS:

```
configure l2vpn vpls myvpls add service vlan myvlan
configure l2vpn vpls myvpls add service vman myvman
```

The following example adds a VLAN and a VMAN to the named VPWS:

```
configure l2vpn vpws myvpws add service vlan vlan2
```

The following example adds a vman:

```
configure l2vpn vpws myvpws add service vman vman2
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn delete peer

```
configure l2vpn [vpls vpls_name | vpws vpws_name] delete peer [ipaddress
   | all]
```

Description

Deletes the specified VPLS or VPWS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the VC-LSP. This option applies only to VPLS peers.
all	Deletes all VPLS or VPWS peers. This option applies only to VPLS peers.

Default

N/A.

Usage Guidelines

When the VPLS or VPWS peer is deleted, VPN connectivity to the peer is terminated. The all keyword can be used to delete all peers associated with the specified Layer 2 VPN.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when deleting a VPWS peer. For backward compatibility, the l2vpn keyword is optional when deleting a VPLS peer. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following example removes connectivity to 1.1.1.202 from VPLS1:

```
configure vpls vpls1 delete peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements*

configure l2vpn delete service

```
configure l2vpn [vpls vpls_name | vpws vpws_name] delete service [{vlan}
   vlan_name | {vman} vman_name]
```

Description

Deletes the specified *VLAN* or VMAN service from the specified Layer 2 VPN.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string).
vpws_name	Identifies the VPWS interface within the switch (character string).
vlan_name	Logically binds the VLAN to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A.

Usage Guidelines

If there are no services configured for the VPLS or VPWS, all PWs within the Layer 2 VPN are terminated from the switch.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when deleting a service from a VPWS. For backward compatibility, the l2vpn keyword is optional when deleting a service from a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following example removes a service interface from a VPLS:

```
configure vpls vpls1 delete vman vman1
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn health-check vccv

```
configure l2vpn [vpls [vpls_name | all] | vpws [vpws_name |
   all]] health-check vccv {interval interval_seconds} {fault-multiplier
   fault_multiplier_number}
```

Description

Configures the Virtual Circuit Connectivity Verification (VCCV) health check test and fault notification intervals for the specified VPLS or VPWS instance.

Syntax Description

vpls_name	Identifies the VPLS instance for which health check is to be configured.
vpws_name	Identifies the VPWS instance for which health check is to be configured.
all	Specifies that the configuration applies to all VPLS instances on the local node.
interval_seconds	Defines the interval between health check tests. The range is 1 to 10 seconds.
fault_multiplier_ number	Specifies how long health check waits before a warning level message is logged. The wait period is the *interval_seconds* multiplied by the *fault_multiplier_number*. The *fault_multiplier_number* range is 2 to 6.

Default

Interval is 5 seconds.

Fault mulitplier is 4.

Usage Guidelines

The VCCV health-check configuration parameters can be configured at anytime after the VPLS has been created.

The `show l2vpn {vpls {{vpls_name} | vpws {{vpws_name}} {peeripaddress} {detail} | summary}` command displays the configured interval_seconds and fault-multiplier_number values for the VPLS or VPWS and the VCCV activity state.

The l2vpn keyword is introduced in ExtremeXOS Release 12.4 and is required when configuring health check for a VPWS. For backward compatibility, the l2vpn keyword is optional when configuring health check for a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command configures the health check feature on the VPLS instance myvpls:

```
configure vpls myvpls health-check vccv interval 10 fault-notification 40
```

History

This command was first available in ExtremeXOS 12.1.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn peer mpls lsp

```
configure l2vpn [vpls vpls_name | vpws vpws_name] peer ipaddress [add |
   delete] mpls lsp lsp_name
```

Description

Adds or deletes a named LSP as a specified PW for the specified Layer 2 VPN peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP. This option applies only to VPLS peers.
add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

If all the named LSPs are deleted from the configured Layer 2 VPN peer, VPLS or VPWS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the peer, Layer 2 VPN connectivity to the peer is lost. Currently, the VPLS or VPWS PW uses only one LSP.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS instance. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following examples add and remove a named LSP:

```
configure l2vpn vpls vpls1 peer 1.1.1.202 add mpls lsp "to-olympic4"
configure l2vpn vpls vpls1 peer 1.1.1.202 delete mpls lsp "to-olympic4"
```

The following example adds a named LSP for a VPWS peer:

```
configure l2vpn vpws vpws1 peer 1.1.1.203 add mpls lsp "to-olympic5"
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn peer

```
configure l2vpn [vpls vpls_name ] peer ipaddress [limit-learning number
    | unlimited-learning]
```

Description

Configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS or VPWS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP. This option applies only to VPLS peers.
limit-learning	Specifies a limit to the number of MAC SAs to be learned for the specified VPLS and peer.
number	The maximum number of MAC SAs that can be learned for the specified VPLS and peer.
unlimited-learning	Specifies no limit to the number of MAC SAs to be learned for the specified VPLS and peer.

Default

Unlimited.

Usage Guidelines

This parameter can only be modified when the specified VPLS is disabled. The unlimited-learning keyword can be used to specify that there is no limit. The default value is unlimited-learning.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS instance. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS

instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following example causes no more than 20 MAC addresses to be learned on VPLS1's PW to 1.1.1.202:

```
configure vpls vpls1 peer 1.1.1.202 limit-learning 20
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn vpls add peer ipaddress

```
configure {l2vpn} vpls vpls_name add peer ipaddress { static-pw
   transmit-label outgoing_pw_label receive-label incoming_pw_label }
```

Description

Configures L2VPN VPLS service over *MPLS* Static PW.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit label	Specifies the static pseudowire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
ncoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to statically configure a new MPLS Ethernet PW for the specified VPLS. You must specify the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels. Similarly, you must configure the peer with a static PW that has the reverse PW label mappings.

Locally, the *incoming_pw_label* must be unique and is allocated out of the static label space. The *outgoing_pw_label* must match the peer's configured incoming PW label.

Just like a signaled PW, a static PW can optionally be configured to use any type of tunnel LSP: LDP, RSVP-TE, or Static. In the case of RSVP-TE and LDP, those protocols must be configured and enabled and an LSP must be established before traffic can be transmitted over the static PW.

For Static LSPs, only the MPLS ingress LSP (or outgoing LSP) is specified. Unlike signaled PWs, there is no end-to-end PW communication that is used to verify that the PW endpoint is operational, and in the case of static LSPs, that the data path to the PW endpoint is viable. In the event of a network fault, if a secondary RSVP-TE LSP is configured or the routing topology changes such that there is an alternate LDP LSP, the static PW will automatically switch LSPs in order to maintain connectivity with the PW endpoint. Static LSPs can be protected proactively by configuring BFD to verify the static LSPs IP next hop connectivity. Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the VPLS/VPWS remains operationally down until the named LSP is restored.

Since VC Status signaling is not supported, the VC Status "standby" bit cannot be used to allow support for PW redundancy and H-VPLS. Consequently, only "core full-mesh" PWs are allowed to have statically configured labels.

Example

The following command configures a new MPLS ethernet pseudowire for vpls1 :

```
configure vpls vpls1 add peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure vpls add service

```
configure vpls vpls_name add service [{vlan} vlan_name | {vman}
   vman_name]
```

Note

This command has been replaced with the following command: `configure l2vpn [vpls vpls_name | vpws vpws_name] add service [{vlan} vlan_name | {vman}vman_name]` . This command is still supported for backward compatibility, but it will be removed from a future release, so we recommend that you start using the new command.

Description

Configures service for VPLS.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string)
vlan_name	Logically binds the *VLAN* to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A.

Usage Guidelines

This command configures the VPLS service for the specified *vpls_name*. The VPLS service may be a customer VLAN or a customer VMAN. Specifying the *vlan_name* logically binds the VLAN to the specified VPLS. Only one VLAN or VMAN may be configured per VPLS.

When a VLAN service has been configured for a VPLS, the VLAN is added to the VPLS specified by the *vpls_name*. The VLAN ID is locally significant to the switch. Thus, each VLAN VPLS interface within the VPLS network may have a different VLAN ID service bound to the VPLS. This greatly simplifies VLAN ID coordination between metro network access points. Traffic may be switched locally between VLAN ports if more than one port is configured for the VLAN.

When a VMAN service has been configured for a VPLS, the VMAN is added to the VPLS specified by vpls_name. The VMAN ID is locally significant to the switch. Thus, each VMAN VPLS interface within the VPLS network may have a different VMAN ID, just like the VLAN service. The only difference is that the VPLS network overwrites the outer VMAN tag on VPLS egress and leaves the inner VLAN tag unmodified. Because the inner VLAN tag is considered part of the customer packet data, the VMAN service can be used to emulate port-based services. This is accomplished by configuring the VPLS to strip the 802.1Q tag from the tunneled packet. Since the switch inserts the VMAN tag when the packet is received and the 802.1Q tag is stripped before the packet is sent on the VPLS PW, all packets received on ports that are members of the VMAN are transmitted unmodified across the VPLS. The command

`configure vpls vpls_name dot1q tag exclude` is used to configure the switch to strip the 802.1Q tag on the VPLS.

Example

The example below adds a VLAN and a VMAN to the named VPLS:

```
configure vpls myvpls add service vlan myvlan
configure vpls myvpls add service vman myvman
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn vpls peer static-pw

`configure l2vpn vpls vpls_name peer ipaddress static-pw {transmit-label outgoing_pw_label receive-label incoming_pw_label }`

Description

Changes the labels of a statically configured Ethernet PW for a VPLS.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
peer	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw	Specifies the static pseudowire.
transmit label	Specifies the pseudowire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static pseudowire receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to change the labels of a statically configured Ethernet PW for a VPLS that already exists. Either or both the outgoing (*MPLS* ingress) and incoming (MPLS egress) PW labels can be specified. The peer must be similarly configured with a static PW that has the reverse PW label mappings. Locally, the *incoming_pw_label* must be unique and is allocated out of the static label space. The *outgoing_pw_label* must match the peer's configured incoming PW label. The L2VPN can remain operational during the change; however, the PW goes down and comes back up.

Example

The following command changes the VPLS label to "VPLS1":

```
# configure l2vpn vpls vpls1 peer static-pw 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn vpls redundancy

```
configure {l2vpn}vpls vpls_name redundancy [esrp esrpDomain | eaps |
   stp]
```

Description

Configures a VPLS instance to provide protected access using the *EAPS* redundancy type, the specified *ESRP* domain, or *STP*.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring protection.
esrpDomain	Configures a VPLS instance to provide protected access using the specified ESRP domain.
eaps	Configures a VPLS instance to use the EAPS redundancy type.
stp	Configures a VPLS instance to request an *FDB* relearning process on an adjacent node when STP responds to a topology change for a *VLAN*.

Default

Redundancy disabled.

Usage Guidelines

Only one redundancy mode can be configured at a time on a VPLS, and the VPLS must be disabled when the redundancy mode is configured. If you attempt to configure a second mode, an error appears. The current redundancy mode must be unconfigured before you configure a different redundancy mode.

The ESRP domain specified must be a valid ESRP domain of type vpls-redundancy. If not, the command is rejected with an appropriate error message. When a VPLS instance is associated with an ESRP domain, the user cannot delete the ESRP domain unless the VPLS redundancy has been unconfigured. For VPLS access protection to become fully functional, VPLS redundancy must also be configured on a second VPLS peer using the same VPLS name and ESRP domain.

Specify the redundancy type as EAPS when using redundant EAPS access rings. This configuration requires EAPS shared links to be configured between redundant VPLS nodes. This configures VPLS to use a PW between VPLS attachment nodes instead of using a customer VLAN. This configuration is only required when there is an EAPS ring on the VPLS service VLAN.

Note
The EAPS master should not be on a VPLS node.

The STP option enables VPLS interfaces to respond appropriately to STP topology changes in a VLAN. For example, if STP detects a link failure, it will flush the appropriate FDB entries to initiate relearning on the STP protected interfaces. When this option is selected and STP initiates relearning, the VPLS interfaces on the same VLAN also initiate relearning so that a new VLAN path to the VPLS core can be learned. For more information, including limitations and restrictions, see the “VPLS STP Redundancy Overview” Section in the *Switch Engine 32.2 User Guide*.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following command adds redundancy to the vpls1 VPLS using the esrp1 domain:

```
configure l2vpn vpls vpls1 redundancy esrp esrp1
```

The following command specifies the EAPS redundancy type for the vpls2 VPLS:

```
configure l2vpn vpls vpls2 redundancy eaps
```

The following command specifies the STP redundancy type for the vpls3 VPLS:

```
configure l2vpn vpls vpls3 redundancy STP
```

History

This command was first available in ExtremeXOS 12.1.

The l2vpn keyword and the STP option were added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn vpws add peer ipaddress

```
configure l2vpn vpws vpws_name add peer ipaddress ipaddress {static-pw
   transmit-label outgoing_pw_label receive-label incoming_pw_label }
```

Description

Configures L2VPN VPWS service over *MPLS* Static PW.

Syntax Description

vpws_name	Specifies the VPWS for which you are configuring a peer.
ipaddress	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit-label	Specifies the static pseudowire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to statically configure a new MPLS Ethernet PW for the specified VPWS. You must specify the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels. Similarly, you must configure the peer with a static PW that has the reverse PW label mappings.

Locally, the *incoming_pw_label* must be unique and is allocated out of the static label space. The *outgoing_pw_label* must match the peer's configured incoming PW label.

Just like a signaled PW, a static PW can optionally be configured to use any type of tunnel LSP: LDP, RSVP-TE, or Static. In the case of RSVP-TE and LDP, those protocols must be configured and enabled and an LSP must be established before traffic can be transmitted over the static PW.

For Static LSPs, only the MPLS ingress LSP (or outgoing LSP) is specified. Unlike signaled PWs, there is no end-to-end PW communication that is used to verify that the PW endpoint is operational, and in the case of static LSPs, that the data path to the PW endpoint is viable. In the event of a network fault, if a secondary RSVP-TE LSP is configured or the routing topology changes such that there is an alternate

LDP LSP, the static PW will automatically switch LSPs in order to maintain connectivity with the PW endpoint. Static LSPs can be protected proactively by configuring BFD to verify the static LSPs IP next hop connectivity. Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the VPLS/VPWS remains operationally down until the named LSP is restored.

Since VC Status signaling is not supported, the VC Status "standby" bit cannot be used to allow support for PW redundancy and H-VPLS. Consequently, only "core full-mesh" PWs are allowed to have statically configured labels.

Example

The following command configures VPWS service for VPWS1 on peer 1.1.1.202:

```
configure vpws vpws1 add peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn vpws peer static-pw

```
configure l2vpn vpws vpws_name peer ipaddress static-pw {transmit-label
   outgoing_pw_label receive-label incoming_pw_label }
```

Description

Changes the labels of a statically configured Ethernet pseudowire for a VPWS.

Syntax Description

vpws_name	Specifies the VPWS for which you are configuring a peer.
peer	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw	Specifies the static pseudowire.
transmit label	Specifies the pseudowire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static pseudowire receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to change the labels of a statically configured Ethernet pseudowire for a VPWS that already exists. Either or both the outgoing (*MPLS* ingress) and incoming (MPLS egress) PW labels can be specified. The peer must be similarly configured with a static PW that has the reverse PW label mappings. Locally, the *incoming_pw_label* must be unique and is allocated out of the static label space. The *outgoing_pw_label* must match the peer's configured incoming PW label. The L2VPN can remain operational during the change; however, the PW goes down and comes back up.

Example

The following command changes the VPWS label to "vpws1":

```
# configure l2vpn vpws vpws1 peer static-pw 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure l2vpn

```
configure l2vpn [vpls vpls_name | vpws vpws_name] {dot1q [ethertype
   hex_number | tag [include | exclude]]} {mtu number}
```

Description

Configures VPLS or VPWS parameters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
dot1q	Specifies the action the switch performs with respect to the 802.1Q ethertype or tag.
ethertype	Overwrites the ethertype value for the customer traffic sent across the PW
hex_number	Identifies the ethertype, uses the format of 0xN.
tag	Specifies the action the switch performs with respect to the 802.1Q tag.
include	Includes the 802.1Q tag when sending packets over the VPLS L2 VPN.

exclude	Strips the 802.1Q tag before sending packets over the VPLS L2 VPN.
mtu	Specifies the MTU value of the VPLS transport payload packet.
number	The size (in bytes) of the MTU value. The configurable MTU range is 1492 through 9216. The default VPLS MTU value is 1500.

Default

dot1q tag - excluded.

ethertype - the configured switch ethertype is used.

number (MTU) - 1500.

Usage Guidelines

This command configures the VPLS and VPWS parameters. PWs are point-to-point links used to carry VPN traffic between two devices within the VPLS. Each device must be configured such that packets transmitted between the endpoints are interpreted and forwarded to the local service correctly. The optional ethertype keyword may be used to overwrite the Ethertype value for the customer traffic sent across the PW. By default, the configured switch ethertype is used. If configured, the ethertype in the outer 802.1q field of the customer packet is overwritten using the configured ethertype value. The ethertype value is ignored on receipt.

Optionally, the switch can be configured to strip the 802.1q tag before sending packets over the VPLS or VPWS Layer 2 VPN. This capability may be required to provide interoperability with other vendor products or to emulate port mode services. The default configuration is to include the 802.1q tag.

The mtu keyword optionally specifies the MTU value of the VPLS or VPWS transport payload packet (customer packet). The MTU value is exchanged with VPLS-configured peer nodes. All VPLS peer nodes must be configured with the same MTU value. If the MTU values do not match, PWs cannot be established between peers. The MTU values are signaled during PW establishment so that endpoints can verify that MTU settings are equivalent before establishing the PW. By default the MTU is set to 1500. The configurable MTU range is 1492 through 9216. Changing the MTU setting causes established PWs to terminate. Payload packets might be dropped if the VPLS or VPWS MTU setting is greater than the *MPLS* MTU setting for the PW interface.

Note

The maximum MTU value supported depends on the current configuration options. For more information, see “Configuring the Layer 2 VPN MTU” in the *Switch Engine 32.2 User Guide*.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling a VPWS. For backward compatibility, the l2vpn keyword is optional when enabling a VPLS. However, this keyword will be required in a future release, so we recommend that you use this keyword for new configurations and scripts.

Example

The following commands change the various parameters of a particular VPLS:

```
configure vpls vpls1 dot1q ethertype 0x8508
configure vpls vpls1 dot1q ethertype 0x8509 mtu 2500
configure vpls vpls1 dot1q tag exclude mtu 2430
configure vpls vpls1 dot1q mtu 2500
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure lacp member-port priority

`configure lacp member-port` *`port`* **`priority`** *`port_priority`*

Description

Configures the member port of an LACP to ensure the order that ports are added to the aggregator. The lower value you configure for the port's priority, the higher priority that port has to be added to the aggregator.

Syntax Description

port	Specifies the LACP member port that you are specifying the priority for.
port_priority	Specifies the priority you are applying to this member port to be assigned to the LACP aggregator. The range is from 0 to 65535; the default is 0. The lower configured value has higher priority to be added to the aggregator.

Default

The default priority is 0.

Usage Guidelines

The port must be added to the *LAG* prior to configuring it for LACP. The default value is 0, or highest priority.

You can configure the port priority to ensure the order in which LAG ports join the aggregator. If you do not configure this parameter, the lowest numbered ports in the LAG are the first to be added to the aggregator; if there are additional ports configured for that LAG, they are put in standby mode.

Use this command to override the default behavior and ensure the order in which LAG ports are selected. Also, if more than one port is configured with the same priority, the lowest numbered port joins the aggregator.

Example

The following command sets the port priority for the LAG port 5:1 to be 55 (which will probably put that port in standby initially):

```
configure lacp member-port 5:1 priority 55
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain

```
configure ldap domain domain_name [default | non-default]
```

Description

This command is used to configure a previously added LDAP domain as default or non-default. If a domain is configured as default, older default domain, if any, will no longer be default since once only one domain can be default at a time.

Syntax Description

domain_name	Name of domain to be configured.

Default

N/A.

Usage Guidelines

Use this command to configure an LDAP domain as default or non-default.

Example

This command marks the LDAP domain sales.XYZCorp.com as the default domain.

```
configure ldap domain sales.XYZCorp.com default
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain add server

```
configure ldap {domain domain_name} add server [host_ipaddr | host_name]
   {server_port} {client-ip client_ipaddr} {vr vr_name} {encrypted sasl
   digest-md5}
```

Description

This command adds an LDAP server under an LDAP domain and configures the parameters for contacting the server.

Syntax Description

domain_name	Specifies the LDAP domain under which this server should be added.
host_ipaddr	Specifies a IP address for an LDAP server to add.
host_name	Specifies a DNS hostname for an LDAP server to add.
server_port	Specifies a port number for the LDAP service. The default port number is 389.
client_ipaddr	Specifies the LDAP client IP address, which should be set to the IP address of the interface that will connect to the LDAP server.
vr_name	Specifies the VR name for the interface that will connect to the LDAP server. The default VR for LDAP client connections is *VR-Mgmt*.
encrypted sasl digest-md5	Specifies that the LDAP client uses Digest RSA Data Security, Inc. *MD5* Message-Digest Algorithm encryption over SASL (Simple Authentication and Security Layer) to communicate with the LDAP server. Note that this mechanism encrypts only the password credentials, and the LDAP information exchange uses plain text. Note: To support Digest RSA Data Security, Inc. MD5 Message-Digest Algorithm over SASL, the LDAP client (bind user) password must be stored using 'reverse encryption,' and the host_name should be configured as the fully-qualified host name for the LDAP server.

Default

client-ipaddr is optional. If client-ipaddr is not specified, the LDAP client looks up the interface through which the LDAP server can be reached.

If vr_name is not specified, the LDAP client assumes it to be VR-Mgmt.

If "encrypted sasl digest-md5' is not specified, the LDAP client talks to the LDAP server using plain text.

Usage Guidelines

You can configure up to 8 LDAP servers under one LDAP domain. The LDAP servers are contacted in the order of configuration. If the first server does not respond before the timeout period expires, the second server is contacted. This process continues until an LDAP server responds, and then the responding server marked as 'active'. Subsequent LDAP requests for that LDAP domain are sent to the 'active' server.

Note

If the switch cannot resolve the host name using a DNS server, the switch rejects the command and generates an error message.

As of 15.2, the "identity-management" keyword is now optional in this command.

Example

The following command configures LDAP client access to LDAP server LDAP1 using encrypted authentication:

```
* Switch.6 # configure ldap add server LDAP1 client-ip 10.10.2.1
encrypted sasl digest-md5
```

The following command adds the LDAP server LDAPServer1.sales.XYZCorp.com under the domain sales.XYZCorp.com and configures the LDAP client to contact it over *VR-Default*. It also configures the LDAP client to communicate with the server using digest-md5 encryption over SASL.

```
configure ldap domain sales.XYZCorp.com add server LDAPServer1.sales.XYZCorp.com vr VR-
Default encrypted sasl digest-md5
```

The following command adds the LDAP server 192.168.1.1 under the domain sales.XYZCorp.com and also configures the LDAP client to contact it through the interface 10.10.10.1 over VR-Mgmt.

```
configure ldap domain sales.XYZCorp.com add server 192.168.1.1 client-ip 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2 to make the identity management keyword optional.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain base-dn

```
configure ldap {domain [domain_name | all]} base-dn [base_dn | none |
   default
```

Description

Configures the LDAP base-dn to be used while searching an user under an LDAP domain.

Syntax Description

domain_name	Specifies the LDAP domain for which this base-dn is to be configured.
base_dn	Specifies the LDAP base domain under which the users are to be searched.
none	Specifies the LDAP root domain as the location under which the users are to be searched.
default	Restores the base_dn to it default value i.e., same as the domain name.

Default

By default base-dn is assumed to be the same as the domain name unless configured otherwise.

If a domain is not specified, the base-dn is configured for the default domain.

Usage Guidelines

LDAP base-dn is the LDAP directory root under which the users are to be searched. By default base-dn is assumed to be the same as the domain name.

For users upgrading from ExtremeXOS 15.1 and older versions, a domain is created with the same name as the base-dn in the older configuration. This domain is marked as the default domain. This can be changed later if required.

Example

The following commands configure the base-dn for the domain sales.XYZCorp.com.

The base-dn configured as XYZCorp.com means that XYZCorp.com is the base location to search for user information.

```
* Switch.11 # configure ldap domain sales.XYZCorp.com base-dn XYZCorp.com
```

The base-dn configured as none means that the directory root is the base location to search for user information.

```
* Switch.12 # configure ldap domain sales.XYZCorp.com base-dn none
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2 to add the {**domain** [*domain_name* | **all**]} option.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain bind-user

```
configure ldap {domain [domain_name |all]} bind-user [user_name
   {encrypted encrypted_password} | password | anonymous]
```

Description

Configures the LDAP client credentials required for the switch to access an LDAP server.

Syntax Description

domain_name	Specifies the LDAP domain for which this bind-user is to be configured.
user_name	Specifies the user name for LDAP server access.
encrypted	Indicates that the specified password is encrypted.
password	Specifies the user password for LDAP server access. Note: To support Digest RSA Data Security, Inc. *MD5* Message-Digest Algorithm over SASL, the password must be stored using 'reverse encryption.'
anonymous	Specifies user anonymous for LDAP server access.

Default

If no domain is specified, the bind-user is configured for the default domain.

Usage Guidelines

The bind-user is an LDAP user who has read access to user information in the LDAP directory.

On many newer directory servers "anonymous" access is disabled. You may also find that though the LDAP bind succeeds, the anonymous user might be denied read access to user information.

Example

The following command configures the LDAP bind user as jsmith with password Extreme for the domain sales.XYZCorp.com:

```
* Switch.14 # configure ldap domain sales.XYZCorp.com bind-user jsmith password Extreme
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain delete server

```
configure ldap {domain [domain_name |all]} delete server [host_ipaddr |
   host_name] {server_port} {vr vr_name}
```

Description

This command is used to delete one or all LDAP servers from one or all LDAP domains.

Syntax Description

domain_name	Specifies the LDAP domain from which this server is to be deleted.
all	Specifies that all configured LDAP servers are to be deleted.
host_ipaddr	Specifies the IP address of the LDAP server to delete.
host_name	Specifies a DNS hostname of the LDAP server to delete.
server_port	Specifies a port number for the LDAP service to delete. The default port number is 389.
vr *vr_name*	Specifies the virtual router to delete.

Default

If a domain is not specified, the server(s) under default domain is deleted.

Usage Guidelines

None.

Example

The following command deletes the LDAP server LDAPServer1.sales.XYZCorp.com from the domain sales.XYZCorp.com:

```
* Switch.8 # configure ldap domain sales.XYZCorp.com delete server
LDAPServer1.sales.XYZCorp.com
```

The following command deletes all LDAP servers from all LDAP domains:

```
* Switch.8 # configure ldap domain all delete server all
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap domain netlogin

```
configure ldap { domain [ domain_name | all ] } [enable|disable]
   netlogin [dot1x | mac | web-based]
```

Description

Enables or disables LDAP queries for the specified type of network login users.

Syntax Description

domain_name	Specifies the LDAP doman for which this configuraton is to be applied.
dot1x	Enables or disables LDAP queries for dot1x network login.
mac	Enables or disables LDAP queries for MAC network login.
web-based	Enables or disables LDAP queries for web-based network login.

Default

LDAP queries are enabled for all types of network login.

Usage Guidelines

It may be necessary to disable LDAP queries for specific type of netlogin user, for example, netlogin mac users, whose username is the same as mac address. The LDAP directory might not contain useful information about these type of users and unnecessary LDAP queries can be avoided.

Note

LDAP queries are not sent for locally authenticated network login users.

Example

The following command enables LDAP queries for MAC network login:

```
* Switch.99 # configure ldap enable netlogin mac
```

The following command disables LDAP queries for dot1x network login:

```
* Switch.99 # configure ldap disable netlogin dot1x
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ldap hierarchical-search-oid

```
configure ldap {domain [domain_name|all]} hierarchical-search-oid [ldap-
   matching-rule-in-chain | oid | none]
```

Description

Configures an OID to perform a hierarchical search if the LDAP server requires it.

Syntax Description

domain_name	Domain name on which to configure ldap.
all	All domains.
ldap-matching-rule-in-chain	Configures the OID 1.2.840.113556.1.4.1941.
oid	Object identifier.
none	Specifies that LDAP query should not include any OID for hierarchical search.

Default

N/A.

Usage Guidelines

Use this command to configure an OID to perform a hierarchical search if the LDAP requires it. The OID supplied with this command will be used to form the LDAP query. If a server does not require extended control OID, the none option can be selected.

Example

```
configure ldap domain abc.com hierarchical-search-oid ldap_matching_rule_in_chain
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp management-address

```
configure lldp management-address [[[{vlan} vlan_name | vlan vlan_id]
   {primary-ip | secondary-ip secondary_ip_address}] | mac-address]
```

Description

Configures a specified VLAN's IP address as the management address to be advertised by *LLDP*.

Syntax Description

vlan	Specifies a VLAN for the management IP address.
vlan_name	Specifies a VLAN name for the management IP address (default is "Mgmt").
vlan_id	Specifies a VLAN ID for the management IP address.
primary-ip	LLDP advertises the primary IP address of the specified VLAN (default). The specified VLAN must be already configured with at-least one primary IPv4 address.
secondary-ip	Specifies that LLDP advertises the secondary IP address of the specified VLAN. The specified secondary IP address must already be configured on the specified VLAN. Note: LLDP does not recognize IPv6 addresses in this field.

secondary_ip_address	Specifies the secondary IP address of the specified VLAN.
mac-address	Specifies that LLDP advertises the MAC address of the switch. This is the default behavior if Management VLAN IP address is not configured and no VLAN is specified by this command.

Default

The system MAC address is advertised by default if the Management VLAN IP address is not configured and no VLAN is specified by this command.

By default, the Management VLAN's IP address is advertised by LLDP.

If you do not specify, LLDP advertises the primary IP address of the specified VLAN.

Usage Guidelines

If the Management VLAN IP address is not configured, LLDP and *CDP (Cisco Discovery Protocol)* advertise the system MAC address as the management address in their management TLV, which makes the network device not accessible. If the Management VLAN IP address is not configured, you can specify any user-defined VLAN's IP address or front panel port VLAN's IP address as the management address for LLDP and CDP protocols.

This command dictates the management address to be advertised by the LLDP protocol; the equivalent command for CDP is configure cdp management-address on page 340.

To use this command, the specified VLAN must already exist. The management IP address configuration is removed if the specified VLAN is deleted, or if the primary IP address of the specified VLAN is deleted (if **primary-ip** configured), or if the specified secondary IP address of the specified VLAN is deleted (if **secondary-ip** configured).

If **primary-ip** is configured and the specified VLAN has multiple primary IP addresses (IPv4 and IPv6), then LLDP advertises the first primary IP address that exists in the address table.

If **secondary-ip** is configured and the specified VLAN has multiple secondary IP addresses, then LLDP advertises only the specified secondary IP address of the configuration.

Note
LLDP does not recognize IPv6 addresses in this field.

Example

The following example configures the primary IP address of the VLAN "vlan1" as the management address to be advertised by LLDP protocol:

```
configure lldp management-address vlan vlan1 primary-ip
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp med fast-start repeat-count

```
configure lldp med fast-start repeat-count count
```

Description

The fast-start feature is automatically enabled when you enable the *LLDP* MED capabilities TLV. This command configures how many times, from 1 to 10, the switch sends out an LLDP MED packet with an interval of 1 second.

Syntax Description

count	Specifies the number of times the switch transmits LLDP MED TLVs each second (once it detects a neighbor transmitting LLDP MED TLVs). The range is 1 to 10.

Default

3.

Usage Guidelines

When the switch detects a MED-capable device, this count determines how many times the switch sends a LLDP MED TLVs with an interval of 1 second. The fast-start feature enables the MED-capable device to quickly learn information; this command changes the value from the default 3. The fast-start feature is automatically enabled when you enable the LLDP MED capabilities TLV.

Note

After you configure the LLDP MED capability TLV, the fast-start feature automatically runs. To configure the LLDP MED capability TLV, use the `configure lldp ports [all | port_list] [advertise | no-advertise] vendor-specific med capabilities` command.

Example

The following command configures fast learning on the switch to a value of 2:

```
configure lldp med fast-start repeat-count 2
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports dcbx add application

```
configure lldp ports [all | port_list] dcbx add application [name
   application_name | ethertype ethertype_value | L4-port port_number |
   tcp-port port_number | udp-port port_number] priority priority_value
```

Description

Configures an application priority to be advertised to DCBX end stations.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
application_name	Specifies an application. Supported values are: • fcoe—Fiber Channel Over Ethernet (FCoE). • fip—FCoE Initiation Protocol (FIP). • iscsi—Internet Small Computer System Interface (iSCSI).
ethertype_value	Specifies an ethertype value in the range of 1536 to 65535.
L4-port *port_number*	Specifies a Layer 4 port number in the range of 0 to 65535. Supported Layer4 protocols include TCP, SCTP, UDP, and DCCP.
tcp-port *port_number*	Specifies a TCP port number in the range of 0 to 65535.
udp-port *port_number*	Specifies a UDP port number in the range of 0 to 65535.
priority_value	Specifies a priority in the range of 0 to 7.

Default

N/A.

Usage Guidelines

This command configures the switch to advertise the priority that an end station should use for the specified application or port number. The priority number is mapped to an 802.1p value, which determines how the switch manages traffic from that application or port.

The switch supports a maximum of 8 DCBX applications per port. If an application configuration already exists on the specified port or ports, the priority is updated to the new value. If the maximum number of applications for a port is exceeded, the switch logs an error message.

Example

The following command configures the switch to advertise priority 4 for the iSCSI application on ports1 to 24:

```
configure lldp ports 1-24 dcbx add application name iscsi priority 4
```

The following command configures the switch to advertise priority 3 for ethertype value 34525 on port1:

```
configure lldp ports 1 dcbx add application ethertype 34525 priority 3
```

The following command configures the switch to advertise priority 6 for Layer 4 port 992 on port1:

```
configure lldp ports 1 dcbx add application L4-port 992 priority 6
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports dcbx delete application

```
configure lldp ports [all | port_list] dcbx delete application [all-
   applications | name application_name | ethertype ethertype_value |
   L4-port port_number | tcp-port port_number | udp-port port_number]
```

Description

Removes the priority configuration for one or all applications from the specified ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
application_name	Specifies an application. Supported values are: • fcoe—Fiber Channel Over Ethernet (FCoE). • fip—FCoE Initiation Protocol (FIP). • iscsi—Internet Small Computer System Interface (iSCSI).
ethertype_value	Specifies an ethertype value in the range of 1536 to 65535.
L4-port *port_number*	Specifies a Layer 4 port number in the range of 0 to 65535. Supported Layer4 protocols include TCP, SCTP, UDP, and DCCP.
tcp-port *port_number*	Specifies a TCP port number in the range of 0 to 65535.
udp-port *port_number*	Specifies a UDP port number in the range of 0 to 65535.

Default

N/A.

Usage Guidelines

This command configures the switch to advertise the priority that an end station should use for the specified application or port number. The priority number is mapped to an 802.1p value, which determines how the switch manages traffic from that application or port.

If an application configuration already exists on the specified port or ports, the priority is updated to the new value.

Example

The following command removes the priority configuration for Layer 4 port 30 on port 23:

```
configure lldp ports 23 dcbx delete application L4-port 30
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports management-address

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **management-address**

Description

Configures the *LLDP* port to advertise or not to advertise management address information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

With ExtremeXOS, you can only add one management address TLV per LLDPDU and the information must be the IP address configured on the management *VLAN*. If no IP address is assigned to the management VLAN, the system sends the system MAC address. LLDP does not send out IPv6 addresses in this field.

Example

The following command advertises the management address information for port 1:5:

```
configure lldp ports 1:5 advertise management-address
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports port-description

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **port-description**

Description

Configures the *LLDP* port to advertise or not advertise port display information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

N/A.

Example

The following command configures port 1:7 to not advertise the port display information to neighbors:

```
configure lldp ports 1:7 no-advertise port-description
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports system-capabilities

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   system-capabilities
```

Description

Configures the *LLDP* port to advertise or not to advertise its system capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When at least one *VLAN* exists with more than two ports, bridging is sent to enabled.

When at least one VLAN on the switch has IP forwarding enabled, the system automatically sets the router bit.

Example

The following command configures all ports to advertise system capability information to neighbors:

```
configure lldp ports all advertise system-capabilities
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports system-description

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   system-description
```

Description

Configures the *LLDP* port to advertise or not to advertise its system description to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

Advertise.

Usage Guidelines

Although not mandatory according to the standard, this TLV is included in the LLDPU by default when you enable LLDP.

When enabled, the system sends the following image (from the show version command) in the system description TLV:

```
ExtremeXOS version 11.2.0.12 v1120b12 by release-manager
on Fri Mar 18 16:01:08 PST 2005
```

Example

The following command configures port 1:4 through port 1:8 to not advertise the system description information to neighbors:

```
configure lldp ports 1:4 - 1:8 no-advertise system-description
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports system-name

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   system-name
```

Default

Configures the *LLDP* port to advertise or not to advertise its system name to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

N/A.

Example

The following command configures port 1:6 to advertise the system name to neighbors:

```
configure lldp ports 1:4 - 1:8 advertise system-name
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific avaya-extreme call-server

The Avaya phone uses this proprietary *LLDP* TLV to learn the IP address(es) of the call server(s) to use.

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific avaya-extreme call-server ip_address_ {ip_address_2
   {ip_address_3 {ip_address_4 {ip_address_5 {ip_address_6 {ip_address_7
   {ip_address_8}}}}}}}
```

Description

Configures the LLDP port to advertise or not advertise up to 8 call server IP addresses to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ip_address_1...8	Specifies IP address of up to 8 call servers. Note: NOTE: This parameter does not apply when you configure the no-advertise parameter.

Default

No advertise.

Usage Guidelines

The Avaya phone uses this proprietary LLDP TLV for addressing information. You can configure the IP address for up to 8 call servers in a single TLV.

Example

The following command configures ports 1-5 to advertise two call server IP addresses to neighbors:

```
configure lldp ports 1-5 advertise vendor-specific avaya-extreme call-server 10.10.10.10
10.11.10.10
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific avaya-extreme dot1q-framing

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific avaya-extreme dot1q-framing [tagged | untagged |
   auto]
```

Description

Configures the *LLDP* port to advertise or not advertise the 802.1q framing configuration to its neighbors. The Avaya phone uses this proprietary LLDP TLV information. In addition to this LLDP TLV, you must enable LLLDP as well as configure both the LLDP MED capabilities TLV and the LLDP network policy TLV.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
tagged	Specifies to use tagging. NOTE: This parameter applies only when you use the advertise parameter.
untagged	Specifies not to use tagging. NOTE: This parameter applies only when you use the advertise parameter.
auto	Specifies following a predetermined sequence (see Usage Guidelines below). NOTE: This parameter applies only when you use the advertise parameter.

Default

No advertise.

Usage Guidelines

Before configuring this LLDP TLV, you must take the following steps:

- Enable LLDP using the `enable lldp ports` command.
- Enable the LLDP MED capabilities TLV using the `configure lldp ports vendor-specific med capabilities` command.
- Enable the LLDP MED network policy TLV using the `configure lldp ports vendor-specific med policy application` command.

This TLV is used to exchange information about Layer 2 priority tagging between the network connectivity device (switch) and the Avaya phone.

If you configure the TLV to advertise tagging, the phone uses tagging information, which it retrieves from the `configure lldp ports vendor-specific med policy application` command. If you configure the TLV to advertise untagged, the phone does not use any tagging, including 802.1q priority tagging.

If you configure the TLV to advertise auto, the phone cycles through the following sequence until an action is successful:

- Uses the configuration advertised by the LLDP MED network policy TLV, as configured by the `configure lldp ports vendor-specific med policy application` command.
- Uses the priority tagged frames configured by the phone's server.
- Sends the traffic untagged.

Example

The following command configures al ports to advertise the dot1q framing as untagged to neighbors:

```
configure lldp ports all advertise vendor-specific avaya-extreme dot1q-framing untagged
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific avaya-extreme file-server

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific avaya-extreme file-server ip_address_1 {ip_address_2
   {ip_address_3 {ip_address_4}}}
```

Description

Configures the *LLDP* port to advertise or not advertise up to 4 file server IP addresses to its neighbors. The Avaya phone uses this proprietary LLDP TLV to learn the IP address(es) of the file server(s) to use.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ip_address_1...4	Specifies IP address of up to 4 file servers. NOTE: This parameter does not apply when you configure the no-advertise parameter.

Default

No advertise.

Usage Guidelines

The Avaya phone uses this proprietary LLDP TLV for addressing information. You can configure the IP address for up to 4 file servers in a single TLV.

Example

The following command configures all ports to advertise two file server IP addresses to neighbors:

```
configure lldp ports 1-5 advertise vendor-specific avaya-extreme call-server 10.20.10.10
10.12.10.10
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific avaya-extreme poe-conservation-request

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific avaya-extreme poe-conservation-request
```

Description

Configures the *LLDP* port to advertise or not advertise a requested conservation level. By default, the requested conservation value on this proprietary LLDP TLV is 0, which is no power conservation. This LLDP TLV is sent out only on *PoE*-capable Ethernet ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

The switch sends this proprietary LLDP TLV to request a PD to go into a certain power conservation level or request the PD to go to the maximum conservation level. This LLDP TLV is transmitted only on PoE-capable ports.

When configured to advertise, the switch sends this TLV with a requested conservation power level of 0, which requests no power conservation. To temporarily change this conservation level, use the SNMP lldpXAvExLocPortXPoEPSEPortReqLevel object to set a new value; the reconfigured value is not saved over a reboot. (This *SNMP* object can be set from 0 to 243 or 255.)

Example

The following command configures all ports to advertise the currently requested conservation level to neighbors:

```
configure lldp ports all advertise vendor-specific avaya-extreme poe-conservation-request
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dcbx

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dcbx {ieee|baseline}
```

Description

Configures the *LLDP* port to advertise or not to advertise Data Center Bridging Exchange (DCBX) information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ieee	Specifies the DCBX protocol defined in IEEE 802.1Qaz.
baseline	Specifies the DCBX protocol known as Baseline Version 1.01, which was defined before IEEE 802.1Qaz.

Default

No advertisement for both DCBX protocols.

Usage Guidelines

If you do not specify a protocol with this command, the advertise option enables advertisement for the IEEE 802.1Qaz protocol, and the no-advertise option disables advertisement for both protocols.

Example

The following command advertises DCBX information according to IEEE 802.1Qaz for port 1:5:

```
configure lldp ports 1:5 advertise vendor specific dcbx
```

The following command advertises DCBX information according to Baseline Version 1.01 for port 2:1:

```
configure lldp ports 2:1 advertise vendor specific dcbx baseline
```

The following command disables advertisement of DCBX information on all ports:

```
configure lldp ports all no-advertise vendor specific dcbx
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot1 port-protocol-vlan-ID

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot1 port-protocol-vlan-ID {vlan [all | vlan_name]}
```

Description

Configures the *LLDP* port to advertise or not advertise port VLAN information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
all	Specifies all *VLAN*s on the port.
vlan_name	Specifies the VLAN on the port that you want to advertise.

Default

No advertise.

Usage Guidelines

When configured to advertise, the switch inserts a port and protocol VLAN ID TLV for each VLAN configured on the ports. The port and protocol VLAN ID TLV allows the port to advertise if it supports protocol and/or tagged VLANs, along with the associated tagged values. A separate TLV is sent for each VLAN that you want to advertise.

By default, once you configure this TLV, the system sends all protocol-based VLANs on the port. However, the LLDPDU cannot exceed 1500 bytes, so you should configure the port to advertise only the specified VLANs.

Note

The total LLPDU size is 1500 bytes; any TLVs after that limit are dropped.

This TLV does not send information on the type of protocol that the VLAN has enabled; it just says whether the port is enabled or disabled for protocol-based VLANs. As Extreme Networks devices are always capable of supporting protocol-based VLANs, once you configure this TLV, the system always advertises support for these VLANs.

Example

The following command configures all ports to advertise port and protocol VLAN information to neighbors for all VLANs on all ports:

```
configure lldp ports all advertise vendor-specific dot1 port-protocol-vlan-id
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot1 port-vlan-ID

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot1 port-vlan-ID
```

Description

Configures the *LLDP* port to advertise or not advertise port vlan ID information to its neighbors. This allows a *VLAN* bridge port to advertise the port VLAN identifier that is associated with untagged or priority-tagged frames.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

The port VLAN ID TLV allows the port to transmit the VLAN ID associated with untagged VLANs. There can be only one port VLAN ID in each LLPDU.

If no untagged VLANs are configured on the specified port, the TLV is not added to the LLPDU, even if you configured this to advertise.

Example

The following command configures all ports to advertise port vlan ID information to neighbors:

```
configure lldp ports all advertise vendor-specific dot1 port-vlan-ID
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot1 vlan-name

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot1 vlan-name {vlan [all | vlan_name]}
```

Description

Configures the *LLDP* port to advertise or not advertise *VLAN* name information to its neighbors. Use this TLV to advertise information for the tagged VLANs you want to specify on the port. This allows an IEEE 802.1Q-compatible 802 LAN station to advertise the assigned name of any VLAN with which it is configured.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
vlan	Specifies all VLANs on the port.
vlan_name	Specifies the VLAN on the port that you want to advertise.

Default

No advertise.

Usage Guidelines

The VLAN name TLV sends the VLAN name and the tag used; it associates a name to a tag for the specified VLAN. This allows an IEEE 802.1Q-compatible 802 LAN station to advertise the assigned name of any VLAN with which it is configured.

You can enable this TLV for tagged and untagged VLANs. When you enable this TLV for tagged VLANs, the TLV advertises the IEEE 802.1Q tag for that VLAN. (For untagged VLANs, the internal tag is advertised.) You can specify exactly which VLANs to advertise.

When configured to advertise, the switch inserts a VLAN name TLV for every VLAN configured on the ports. By default, once you configure this TLV, the system sends all VLAN names on the port. However, each VLAN name can require up to 32 bytes and the LLDPDU cannot exceed 1500 bytes, so you should configure the port to advertise only the specified VLANs, using the keyword vlan_name.

Note

The total LLPDU size is 1500 bytes; any TLVs after that limit are dropped.

Example

The following command configures all ports to not advertise VLAN name information to neighbors:

```
configure lldp ports all no-advertise vendor-specific dot1 vlan-name
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot3 link-aggregation

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot3 link-aggregation
```

Description

Configures the *LLDP* port to advertise or not advertise link-aggregation capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When configured, this TLV is added to each LLDP port LLDPDU indicating the link-aggregation capabilities, status, and value of the master port of the load-sharing group.

Example

The following command configures port 1:12 to not advertise link-aggregation capabilities to neighbors:

```
configure lldp ports 1:12 no-advertise vendor-specific dot3 link-aggregation
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot3 mac-phy

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot3 mac-phy
```

Description

Configures the *LLDP* port to advertise or not advertise MAC and physical layer capabilities to its neighbors. The capabilities include duplex and bit rate.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When configured, the system advertises information about the speed capabilities, as well as autonegotiation support and status, of the LLDP port.

Example

The following command configures all ports to advertise MAC/PHY capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific dot3 mac-phy
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot3 max-frame-size

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot3 max-frame-size
```

Description

Configures the *LLDP* port to advertise or not advertise its maximum frame size to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When jumbo frames are not enabled on the specified port, the TLV reports a value of 1518 once you configure it to advertise. If jumbo frames are enabled, the TLV inserts the configured value for the jumbo frames.

Example

The following command configures ports 1:12 and 1:13 to advertise the maximum frame size to neighbors:

```
configure lldp ports 1:12 - 1:13 advertise vendor-specific dot3 max-frame-size
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific dot3 power-via-mdi

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific dot3 power-via-mdi {with-classification}
```

Description

Configures the *LLDP* port to advertise or not advertise Power over Ethernet (PoE) capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
with-classification	Specifies to use LLDP for Data Link Layer Classification. This option is available only on PoE+ ports.

Default

No advertise.

Usage Guidelines

When configured, the system includes this TLV. We recommend enabling this TLV only on PoE-capable ports.

The following information is transmitted for LLDP ports with this TLV:

- Support PoE or not
- Port class
  - Power sourcing equipment (PSE)
  - Powered device (PD)
- Power pairs used to supply power
  - Signal
  - Spare
- Power status
- Support pairs control or not
- Power class
  - Class0
  - Class1
  - Class2
  - Class2
  - Class3
  - Class4

Data link layer classification allows fine-grained dynamic re-allocation of power based on changing needs. This feature is enabled by enabling LLDP (transmit and receive) and configuring transmission of the power-via-MDI TLV. The ExtremeXOS software sends an LLDPDU containing a power-via-MDI TLV within 10 seconds of DLL classification being enabled. A PD may request a new power value using an LLDPDU. The allocated power might be changed if a request is received and approved after a power review. The software responds with an allocated power value within 10 seconds of receipt of an LLDPDU with a different requested power from a PD. Power allocation can be controlled to a granularity of 0.1 watts. When DLL classification is enabled, it takes precedence over physical classification.

Note

For more information on advertising power support, see the `configure lldp ports vendor-specific med power-via-mdi` command.

Example

The following command configures all ports to advertise power capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific dot3 power-via-mdi
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific med capabilities

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific med capabilities
```

Description

Configures the *LLDP* port to advertise or not advertise MED capabilities. This TLV must be enabled before any of the other MED TLVs can be enabled. Also, this TLV must be set to no-advertise after all other MED TLVs are set to no-advertise.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

This command enables the LLDP media endpoint discovery (MED) capabilities TLV, which allows LLDP-MED network connectivity devices to definitively determine that particular endpoints support LLDP MED, and if so, to discover which LLDP MED TLVs the particular endpoint devices are capable of supporting and to which specific device class the device belongs to.

This TLV must be enabled before any of the other MED TLVs can be enabled; and this TLV must be set to no-advertise after all other MED TLVs are set to no-advertise.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Note

Network connectivity devices wait to detect LLDP MED TLVs from endpoints before they send out LLDP MED TLVs; so L2 network connectivity devices do not exchange LLDP MED messages.

The following information is included in the LLDP MED capabilities TLV when it is transmitted:

- The supported LLDP MED TLVs—For Extreme Networks devices, these are capabilities, network policy, location, and extended power (extended power only advertised only on *PoE*-capable ports).
- The MED device type—For Extreme Networks devices, this is advertised as a network connectivity device (set to 4).

Example

The following command configures all ports to advertise MED capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific med capabilities
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific med location-identification

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific med location-identification [coordinate-based
   hex_value | civic-based hex_value | ecs-elin elin]
```

Description

Configures the *LLDP* port to advertise or not advertise MED location information. You configure up to 3 different location identifiers.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies to not send the information to neighbors.

coordinate-based	Specifies using the coordinate-based location identifier. This value is exactly 16 bytes long; see RFC 3825 for details.
hex_value	Enter a hexadecimal value with each byte separated by a colon. Or, you can obtain this value from a network management application. NOTE: This parameter is not used when the no-advertise parameter is configured.
civic-based	Specifies using the civic-based location identifier. This value must have a minimum length of 6 bytes; see RFC3825 for details.
ecs-elin	Specifies using the ecs location identifier. (Emergency Call Service, as defined in the TIA-TSB-146.)
elin	Enter a numerical string; the range is 10 to 25 characters. Or, you can obtain this value from a network management application. (See the TIA-TSB-146 standard for a definition of these numbers; also, the network management application must be able to handle the LLDP MED MIB.) NOTE: This parameter is not used when the no-advertise parameter is configured.

Default

No advertise.

Usage Guidelines

You might need to use a specific format for your specific VoIP implementation; see the VoIP manufacturer's manual for details.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the `configure lldp ports [all | port_list] [advertise | no-advertise] vendor-specific med capabilities` command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Example

The following command configures all ports to advertise MED location information to neighbors using the ECS format:

```
configure lldp ports all advertise vendor-specific med location-identification ecs-elin
423233455676
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific med policy application

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific med policy application [voice | voice-signaling
   |guest-voice | guest-voice-signaling | softphone-voice | video-
   conferencing | streaming-video | video-signaling] vlan vlan_name dscp
   dscp_value {priority-tagged}
```

Description

Configures the *LLDP* port to advertise or not advertise MED network policy TLVs. This TLV advertises *VLAN* configuration and associated Layer 2 and Layer 3 attributes that apply for a set of specific applications on that port. You can advertise up to 8 TLVs, each for a specific application, per port/VLAN. Each application type can exist only once per port. This TLV tells the endpoint the specific VLAN to use for the specific application, along with its unique priority.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
advertise	Specifies to send the information to neighbors.
voice	Specifies voice application on specified port/VLAN(s).
voice-signaling	Specifies voice signaling application on specified port/VLAN(s).
guest-voice	Specifies guest voice application on specified port/VLAN(s).
guest-voice-signaling	Specifies guest voice signaling application on specified port/VLAN(s).
softphone-voice	Specifies soft phone voice application on specified port/VLAN(s).
video-conferencing	Specifies videoconferencing application on specified port/VLAN(s).
streaming-video	Specifies streaming video application on specified port/VLAN(s).
video-signaling	Specifies video signaling application on specified port/VLAN(s).
vlan_name	Specifies the VLAN the specified application is using. NOTE: This parameter does not apply when the no-advertise parameter is configured.

dscp_value	Specifies the DSCP value for the specified application. This is a 6-bit value from 0 to 63. NOTE: This parameter does not apply when the no-advertise parameter is configured.
priority-tagged	Use this if you want priority tagging, and the VLAN is configured as untagged on the port. (The endpoint sends out frames for the specified application with a tag of 0.) NOTE: This parameter does not apply when the no-advertise parameter is configured.

Default

No advertise.

Usage Guidelines

This command enables the LLDP MED network policy TLV, which allows network connectivity devices and endpoint devices to advertise VLAN configuration and associated Layer 2 and Layer 3 attributes that apply for a set of specific application on that port. This TLV can be enabled on a per port/VLAN basis. Each application type can exist only once on a port.

You can enable the transmission of a TLV policy for each application. A maximum of 8 TLVs can be enabled, and each can have a unique DSCP value and/or priority tagging.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the `configure lldp ports [all | port_list] [advertise | no-advertise] vendor-specific med capabilities` command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

The following information is transmitted for LLDP ports with this TLV:

- Application type

  Used as configured.
- Unknown policy flag

  Set to 0.
- Tagged flag

  Set to tagged for tagged VLANs; set to untagged for untagged VLANs. By default, set to 0.
- VLAN ID

  Copied from the VLAN. However, if you configure the priority-tagged parameter, this value is set to 0.
- Layer 2 priority

  Copied from the VLAN priority.
- DSCP value

Uses the value configured in the dscp parameter.

Note

See the documentation provided by the manufacturer of connected devices regarding values.

Example

The following command configures all ports to advertise videoconferencing on the VLAN video with a DSCP of 7 to neighbors:

```
configure lldp ports all advertise vendor-specific med policy application video-
conferencing vlan video dscp 7
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp ports vendor-specific med power-via-mdi

```
configure lldp ports [all | port_list] [advertise | no-advertise]
   vendor-specific med power-via-mdi
```

Description

Configures the *LLDP* port to advertise or not advertise MED power requirement details. This TLV can only be enabled on a *PoE*-capable port and is used for advanced power management between the MED network connectivity and endpoint devices.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When enabled, this LLDP MED TLV advertises fine-grained power requirement details about PoE settings and support. This TLV can be enabled only on a PoE-capable port; the switch returns an error message if this TLV is configured for a non-PoE-capable port.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the `configure lldp ports [all | port_list] [advertise | no-advertise] vendor-specific med capabilities` command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Note

For additional information on power support, see the `configure lldp ports vendor-specific dot3 power-via-mdi` command.

The following information is transmitted for LLDP MED PoE-capable ports with this TLV:

- Power type

  Set to PSE.
- Power source

  Set to primary power source.
- Power priority

  Taken from PoE port configuration.
- Power value

  Taken from PoE port configuration.

Example

The following command configures all ports to advertise MED power information to neighbors:

```
configure lldp ports all advertise vendor-specific med power-via-mdi
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp reinitialize-delay

```
configure lldp reinitialize-delay seconds
```

Description

Configures the delay before the receive state machine is reinstalled once the *LLDP* transmit mode has been disabled.

Syntax Description

seconds	Specifies the delay that applies to the reinitialization attempt. The range is 1 to 10 seconds.

Default

2 seconds.

Usage Guidelines

N/A.

Example

The following command configures a reinitialization delay of 10 seconds:

```
configure lldp reinitialize-delay 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp snmp-notification-interval

`configure lldp snmp-notification-interval` *seconds*

Description

Configures the allowed interval at which *SNMP* notifications are sent.

Syntax Description

seconds	Specifies the interval at which *LLDP* SNMP notifications are sent. The range is 5 to 3600 seconds.

Default

5 seconds.

Usage Guidelines

This is a global timer. If one port sends a notification, no notifications for other ports go out for the configured interval.

Example

The following command configures an interval of 60 seconds for LLDP SNMP notifications:

```
configure lldp snmp-notification-interval 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp transmit-delay

```
configure lldp transmit-delay [ auto | seconds]
```

Description

Configures the delay time between successive frame transmissions initiated by a value change or status change in any of the *LLDP* local systems Management Information Base (MIB).

The auto option uses a formula (0.25 * transmit-interval) to calculate the number of seconds.

Syntax Description

auto	Uses the formula (0.25 * transmit-interval) to calculate the seconds.
seconds	Specifies the interval at which LLDP notifications are sent. The range is 1 to 8291.

Default

2 seconds.

Usage Guidelines

This is the timer between triggered updates.

Example

The following command configures the delay between LLDP frame transmissions for triggered updates to be automatically calculated:

```
configure lldp transmit-delay auto
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp transmit-hold

```
configure lldp transmit-hold hold
```

Description

Calculates the actual time-to-live (TTL) value used in the LLDPDU messages.

The formula is transmit-interval * transmit-hold; by default the TTL value is (30*4) 120 seconds.

Syntax Description

hold	Used to calculate the TTL value; the range is 2 to 10.

Default

4.

Usage Guidelines

N/A.

Example

The following command configures the transmit-hold value (which is used to calculate the TTL of the *LLDP* packets) to 5:

```
configure lldp transmit-hold 5
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure lldp transmit-interval

```
configure lldp transmit-interval seconds
```

Description

Configures the periodic transmittal interval for LLDPDUs.

Syntax Description

seconds	Specifies the time between LLDPDU transmissions. The range is 5 to 32768.

Default

30 seconds.

Usage Guidelines

N/A.

Example

The following command configures a transmittal interval of 20 seconds for LLDPDUs.

```
configure lldp transmit-interval 20
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log display

```
configure log display severity {only}
```

Description

Configures the real-time log-level message to display.

Syntax Description

severity	Specifies a message severity. Severities include critical, error, warning, notice, info, debug-summary, debug-verbose, and debug-data.
only	Specifies only log messages of the specified severity level.

Default

If not specified, messages of all severities are displayed on the console display.

Usage Guidelines

You must enable the log display before messages are displayed on the log display. Use the `enable log display` command to enable the log display. This allows you to configure the system to maintain a running real-time display of log messages on the console.

Severity filters the log to display messages with the selected severity or higher (more critical). Severities include critical, error, warning, info, notice, debug-summary, debug-verbose, and debug-data.

You can also control log data to different targets. The command equivalent to `configure log display` is the following:

`configure log target console-display severity` *severity*

To display the current configuration of the log display, use the following command:

`show log configuration target console-display`

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Example

The following command configures the system log to maintain a running real-time display of log messages of critical severity or higher:

```
configure log display critical
```

The following command configures the system log to maintain a running real-time display of only log messages of critical severity:

```
configure log display critical only
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log filter events

```
configure log filter name [add | delete] {exclude} events [event-
   condition | [all | event-component] {severity severity {only}}]
```

Description

Configures a log filter to add or delete detailed feature messages based on a specified set of events.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

name	Specifies the filter to configure.
add	Add the specified events to the filter.
delete	Remove the specified events from the filter.
exclude	Events matching the specified events will be excluded.
event-condition	Specifies an individual event.
all	Specifies all components and subcomponents.
event-component	Specifies all the events associated with a particular component.
severity	Specifies the minimum severity level of events (if the keyword only is omitted).
only	Specifies only events of the specified severity level.

Default

If the exclude keyword is not used, the events will be included by the filter. If severity is not specified, then the filter will use the component default severity threshold (see the note note: If no severity is specified when delete or exclude is specified, severity all is used when delete or exclude is specified).

Usage Guidelines

This command controls the incidents that pass a filter by adding, or deleting, a specified set of events. If you want to configure a filter to include or exclude incidents based on event parameter values (for example, MAC address or *BGP* Neighbor) see the command `configure log filter events match`.

When the add keyword is used, the specified event name is added to the beginning of the filter item list maintained for this filter. The new filter item either includes the events specified, or if the exclude keyword is present, excludes the events specified.

The delete keyword is used to remove events from the filter item list that were previously added using the add command. All filter items currently in the filter item list that are identical to, or a subset of, the set of events specified in the delete command will be removed.

Event Filtering Process

From a logical standpoint, the filter associated with each enabled log target is examined to determine whether a message should be logged to that particular target. The determination is made for a given filter by comparing the incident with the most recently configured filter item first. If the incident matches this filter item, the incident is either included or excluded, depending on whether the exclude keyword was used. Subsequent filter items on the list are compared if necessary. If the list of filter items has been exhausted with no match, the incident is excluded.

Events, Components, and Subcomponents

As mentioned, a single event can be included or excluded by specifying the event's name. Multiple events can be added or removed by specifying an ExtremeXOS component name plus an optional severity. Some components, such as BGP, contain subcomponents, such as Keepalive, which is specified as BGP.Keepalive. Either components or subcomponents can be specified. The keyword all in place of a component name can be used to indicate all ExtremeXOS components.

Severity Levels

When an individual event name is specified following the events keyword, no severity value is needed since each event has pre-assigned severity. When a component, subcomponent, or the all keyword is specified following the events keyword, a severity value is optional. If no severity is specified, the severity used for each applicable subcomponent is obtained from the pre-assigned severity threshold levels for those subcomponents. For example, if *STP* were specified as the component, and no severity is specified for the add of an include item, then only messages with severity of error and greater would be passed, since the threshold severity for the STP component is error. If STP.InBPDU were specified as the component, and no severity is specified, then only messages with severity of warning and greater would be passed, since the threshold severity for the STP.InPBDU subcomponent is warning. Use the `show log components` command to see this information.

The severity keyword all can be used as a convenience when delete or exclude is specified. The use of delete (or exclude) with severity all deletes (or excludes) previously added events of the same component of all severity values.

Note

If no severity is specified when delete or exclude is specified, severity all is used.

If the only keyword is present following the severity value, then only the events in the specified component at that exact severity are included. Without the only keyword, events in the specified component at that severity or more urgent are included. For example, using the option severity warning implies critical, error, or warning events, whereas the option severity warning only implies warning events only. Severity all only is not a valid choice.

Any EMS events with severity debug-summary, debug-verbose, or debug-data will not be logged unless debug mode is enabled. See the command `enable log debug-mode`.

Filter Optimization

Each time a configure log filter command is issued for a given filter name, the events specified are compared against the current configuration of the filter to try to logically simplify the configuration.

For example, if the command:

```
configure log filter bgpFilter1 add events bgp.keepalive severity error
only
```

were to be followed by the command:

```
configure log filter bgpFilter1 add events bgp severity info
```

the filter item in the first command is automatically deleted since all events in the BGP.Keepalive subcomponent at severity error would be also included as part of the second command, making the first command redundant.

More Information

See the command `show log` for more information about severity levels.

To get a listing of the components present in the system, use the following command:

`show log components`

To get a listing of event condition definitions, use the following command:

`show log events`

To see the current configuration of a filter, use the following command:

`show log configuration filter {filter name}`

Example

The following command adds all STP component events at severity info to the filter mySTPFilter:

```
configure log filter myStpFilter add events stp severity info
```

The following command adds the STP.OutBPDU subcomponent, at the pre-defined severity level for that component, to the filter myStpFilter:

```
configure log filter myStpFilter add events stp.outbpdu
```

The following command excludes one particular event, STP.InBPDU.Drop, from the filter:

```
configure log filter myStpFilter add exclude events stp.inbpdu.drop
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log filter events match

```
configure log filter name [add | delete] {exclude} events [event-
   condition | [all | event-component] {severity severity {only}}]
   [match | strict-match] type value
```

Description

Configures a log filter to add or delete detailed feature messages based on a specified set of events and match parameter values.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

name	Specifies the filter to configure.
add	Add the specified events to the filter.
delete	Remove the specified events from the filter.
exclude	Events matching the filter will be excluded.
event-condition	Specifies the event condition.
all	Specifies all events.
event-component	Specifies all the events associated with a particular component.
severity	Specifies the minimum severity level of events (if the keyword only is omitted).
only	Specifies only events of the specified severity level.
match	Specifies events whose parameter values match the *type value* pair.
strict-match	Specifies events whose parameter values match the *type value* pair, and possess all the parameters specified.
type	Specifies the type of parameter to match. For more information about types and values see Types and Values.
value	Specifies the value of the parameter to match. For more information about types and values see Types and Values.

Default

If the **exclude** keyword is not used, the events will be included by the filter. If severity is not specified, then the filter will use the component default severity threshold (see the note on note: If no severity is specified when delete or exclude is specified, severity all is used when delete or exclude is specified).

Usage Guidelines

This command controls the incidents that pass a filter by adding or deleting a specified set of events that match a list of *type value* pairs. This command is an extension of the command `configure`

`log filter events`, and adds the ability to filter incidents based on matching specified event parameter values to the event.

See the `configure log filter events` command `configure log filter events` for more information on specifying and using filters, on event conditions and components, and on the details of the filtering process. The discussion here is about the concepts of matching *type value* pairs to more narrowly define filters.

Types and Values

Each event in ExtremeXOS is defined with a message format and zero or more parameter types. The `show log events` command `show log events` can be used to display event definitions (the event text and parameter types). The syntax for the parameter types (represented by *type* in the command syntax above) is:

`[address-family [ipv4-multicast | ipv4-unicast | ipv6-multicast | ipv6-unicast] | bgp-neighbor` *ip address* `| bgp-routerid`*ip address* `| eaps` *eaps domain name* `| {destination | source} [ipaddress` *ip address* `| L4-port | mac-address ] | esrp`*esrp domain name* `| {egress | ingress} [slot`*slot number* `| ports`*port_list*`] | ipaddress`*ip address* `| L4-port`*L4-port* `| mac-address`*mac_address* `| netmask` *netmask* `| number` *number* `| port`*port_list* `| process`*process name* `| slot` *slotid* `| string`*exact string to be matched* `| vlan`*vlan name* `| vlan tag`*vlan tag*`]`

Note
The slot parameters are available only on SummitStacks.

Beginning with ExtremeXOS 11.2, you can specify the ipaddress type as IPv4 or IPv6, depending on the IP version. The following examples show how to configure IPv4 addresses and IPv6 addresses:

- IPv4 address.

  To configure an IP address, with a mask of 32 assumed, use the following command:

```
configure log filter myFilter add events all match ipaddress 12.0.0.1
```

To configure a range of IP addresses with a mask of 8, use the following command:

```
configure log filter myFilter add events all match ipaddress 12.0.0.0/8
```

- IPv6 address.

  To configure an IPv6 address, with a mask of 128 assumed, use the following command:

  - `configure log filter myFilter add events all match ipaddress 3ffe::1`
  - To configure a range of IPv6 addresses with a mask of 16, use the following command:
  - `configure log filter myFilter add events all match ipaddress 3ffe::/16`

- IPv6 scoped address.

  IPv6 scoped addresses consist of an IPv6 address and a VLAN. The following examples identify a link local IPv6 address.

To configure a scoped IPv6 address, with a mask of 128 assumed, use the following command:

Note
In the previous example, if you specify the *VLAN* name, it must be a full match; wild cards are not allowed.

The *value* depends on the parameter type specified. As an example, an event may contain a physical port number, a source MAC address, and a destination MAC address. To allow only those incidents with a specific source MAC address, use the following in the command:

```
configure log filter myFilter add events aaa.radius.requestInit secerity
notice match source mac-address 00:01:30:23:C1:00 configure log filter
myFilter add events bridge severity notice match source mac-address
00:01:30:23:C1:00
```

The string type is used to match a specific string value of an event parameter, such as a user name. The exact string is matched with the given parameter and no regular expression is supported.

Match Versus Strict-Match

The match and strict-match keywords control the filter behavior for incidents whose event definition does not contain all the parameters specified in a `configure log filter events match` command. This is best explained with an example. Suppose an event in the XYZ component, named XYZ.event5, contains a physical port number, a source MAC address, but no destination MAC address. If you configure a filter to match a source MAC address and a destination MAC address, XYZ.event5 will match the filter when the source MAC address matches regardless of the destination MAC address, since the event contains no destination MAC address. If you specify the strict-match keyword, then the filter will never match, since XYZ.event5 does not contain the destination MAC address.

In other words, if the match keyword is specified, an incident will pass a filter so long as all parameter values in the incident match those in the match criteria, but all parameter types in the match criteria need not be present in the event definition.

More Information

See the command `show log` for more information about severity levels.

To get a listing of the components present in the system, use the following command:

```
show log components
```

To get a listing of event condition definitions, use the following command:

```
show log events
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {filter name}
```

Example

By default, all log targets are associated with the built-in filter, DefaultFilter. Therefore, the most straightforward way to send additional messages to a log target is to modify DefaultFilter. In the

following example, the command modifies the built-in filter to allow incidents in the *STP* component, and all subcomponents of STP, of severity critical, error, warning, notice and info. For any of these events containing a physical port number as a match parameter, limit the incidents to only those occurring on physical ports 3, 4 and 5 on slot 1, and all ports on slot 2:

```
configure log filter DefaultFilter add events stp severity info match ports 1:3-1:5, 2:*
```

If desired, issue the unconfigure log DefaultFilter command to restore the DefaultFilter back to its original configuration.

History

This command was first available in ExtremeXOS 10.1.

New parameter *type* values, including esrp and eaps were added in ExtremeXOS 11.0 and 11.1.

Support for IPv6 addresses was added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log messages privilege

```
configure log messages privilege [ admin | user ]
```

Description

This command configures the minimum user account level needed to view logs.

Syntax Description

messages	NVRAM and memory-buffer message targets.
privilege	Configure minimum privilege level needed to view logs.
admin	Only admin (read-write) accounts can view log.
user	User (read-only) accounts can view log also (default).

Default

User.

Usage Guidelines

Use this command to configure the account level needed to view logs.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target filter

```
configure log target [console | memory-buffer | | primary-node | |
   backup-node | nvram | session | syslog [all | ipaddress {udp-port
   {udp_port}} | ipPort | ipaddress tls-port {tls_port} ]{vr vr_name}
   {local0...local7}] filter filter-name {severity severity {only}}
```

Description

Associates a filter to a target.

In a stack, this command is applicable only to Master and Backup nodes. This command is not applicable to standby nodes.

Syntax Description

target	Specifies the device to send the log entries.
console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
primary-node	Specifies the primary node in a stack.
backup-node	Specifies the backup node in a stack.
nvram	Specifies the switch NVRAM.
session	Specifies the current session (including console display).
syslog	Specifies a syslog remote server.
all	Specifies all of the syslog remote servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local syslog facility.
filter-name	Specifies the filter to associate with the target.
severity	Specifies the minimum severity level to send (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be sent.

Default

If severity is not specified, the severity level for the target is left unchanged. If a virtual router is not specified, *VR-Mgmt* is used.

Usage Guidelines

This command associates the specified filter and severity with the specified target. A filter limits messages sent to a target.

Although each target can be configured with its own filter, by default, all targets are associated with the built-in filter, DefaultFilter. Each target can also be configured with its own severity level. This provides the ability to associate multiple targets with the same filter, while having a configurable severity level for each target.

A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified. By default, the memory buffer and NVRAM targets are enabled. For other targets, use the command `enable log target`. The following table describes the default characteristics of each type of target.

Table 13: Default target log characteristics

Target	Enabled	Severity Level
console display	no	info
memory buffer	yes	debug-data
NVRAM	yes	warning
session	no	info
syslog	no	debug-data

The built-in filter, DefaultFilter, and a severity level of info are used for each new telnet session. These values may be overridden on a per-session basis using the `configure log target filter` command and specify the target as session. Use the following form of the command for per-session configuration changes:

```
configure log target session filter filtername {severity severity
{only}}
```

Configuration changes to the current session target are in effect only for the duration of the session, and are not saved in FLASH memory. The session option can also be used on the console display, if the changes are desired to be temporary. If changes to the console-display are to be permanent (saved to FLASH memory), use the following form of the command:

```
configure log target console filter filtername {severity severity
{only}}
```

SummitStack Only

The backup-node target is only active on the primary-node, and the primary-node target is active on backup-node and standby-nodes.

Example

The following example sends log messages to the previously syslog host at 10.31.8.25, port 8993, and facility local3, that pass the filter myFilter and are of severity warning and above:

```
configure log target syslog 10.31.8.25:8993 local3 filter myFilter severity warning
```

The following example sends log messages to the current session, that pass the filter myFilter and are of severity warning and above:

```
configure log target session filter myFilter severity warning
```

History

This command was first available in ExtremeXOS 10.1.

The *ipPort* parameter was first available in ExtremeXOS 11.1.

The udp-port parameter was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target format

For console display, session, memory buffer, and NVRAM targets:

```
configure log target [ console | session | memory-buffer | nvram ]
   format [timestamp [seconds | hundredths | none]] [date [ dd-Mmm-yyyy
   | yyyy-mm-dd | Mmm-dd | mm-dd-yyyy | mm/dd/yyyy | dd-mm-yyyy | none]]
   {event-name [component | condition | none]} {process-name} {severity}
   {source-line} {host-name}
```

For Syslog targets:

```
configure log target syslog [all | ipaddress {udp-port {udp_port}} |
   ipPort | ipaddress tls-port {tls_port}] {vr vr_name} {local}format
   [timestamp [ seconds | hundredths | none]] [date [ dd-Mmm-yyyy |
   yyyy-mm-dd | Mmm-dd | mm-dd-yyyy | mm/dd/yyyy | dd-mm-yyyy | none]]
   {event-name [component | condition | none]} {severity} {priority}
   {host-name} {source-line} {tag-id} {tag-name}
```

Description

Configures the formats of the displayed message, on a per-target basis.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

console	Specifies the console display.
session	Specifies the current session (including console display).
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
syslog	Specifies a syslog target.
all	Specifies all remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local syslog facility.
timestamp	Specifies a timestamp formatted to display seconds, hundredths, or none.
date	Specifies a date formatted as specified, or none.
event-name	Specifies how detailed the event description will be. Choose from none, component or condition.
host-name	Specifies whether to include the syslog host name.
priority	Specifies whether to include the priority.
process-name	Specifies whether to include the internal process name.
severity	Specifies whether to include the severity.
source-line	Specifies whether to include the source file name and line number.
tag-id	Specifies whether to include the tag ID.
tag-name	Specifies whether to include the tag name.

Default

The following defaults apply to console display, memory buffer, NVRAM, and session targets:

- timestamp—hundredths
- date—mm-dd-yyyy
- event-name—condition
- process-name—off
- severity—on
- source-line—off
- host-name—off

The following defaults apply to syslog targets (per RFC 3164):

- timestamp—seconds
- date—mmm-dd
- event-name—none
- severity—on
- priority—on
- host-name—off
- source-line—off
- tag-id—off
- tag-name—on

If a virtual router is not specified, *VR-Mgmt* is used.

Usage Guidelines

This command configures the format of the items that make up log messages. You can choose to include or exclude items and set the format for those items, but you cannot vary the order in which the items are assembled.

When applied to the targets console or session, the format specified is used for the messages sent to the console display or telnet session. Configuration changes to the session target, be it either a telnet or console display target session, are in effect only for the duration of the session, and are not saved in FLASH.

When this command is applied to the target memory-buffer, the format specified is used in subsequent `show log` and `upload log` commands. The format configured for the internal memory buffer can be overridden by specifying a format on the `show log` and `upload log` commands.

When this command is applied to the target syslog, the format specified is used for the messages sent to the specified syslog host.

Timestamps

Timestamps refer to the time an event occurred, and can be output in either seconds as described in RFC 3164 (for example, “13:42:56”), hundredths of a second (for example, “13:42:56.98”), or suppressed altogether. To display timestamps as hh:mm:ss, use the seconds keyword, to display as hh:mm:ss.HH, use the hundredths keyword, or to suppress timestamps altogether, use the none keyword. Timestamps are displayed in hundredths by default.

Date

The date an event occurred can be output as described in RFC 3164. Dates are output in different formats, depending on the keyword chosen. The following lists the date keyword options, and how the date “March 26, 2005” would be output:

- Mmm-dd—Mar 26
- mm-dd-yyyy—03/26/2005

- dd-mm-yyyy—26-03-2005
- yyyy-mm-dd—2005-03-26
- dd-Mmm-yyyy—26-Mar-2005

Dates are suppressed altogether by specifying none. Dates are displayed as mm-dd-yyyy by default.

Event Names

Event names can be output as the component name only by specifying event-name component and as component name with condition mnemonic by specifying event-name condition, or suppressed by specifying event-name none. The default setting is event-name condition to specify the complete name of the events.

Host Name

The configured *SNMP* name of the switch can be output as HOSTNAME described in RFC 3164 by specifying host-name. The default setting is off.

Process Name

For providing detailed information to technical support, the (internal) ExtremeXOS task names of the applications detecting the events can be displayed by specifying process-name. The default setting is off.

Severity

A four-letter abbreviation of the severity of the event can be output by specifying severity on or suppressed by specifying severity off. The default setting is severity on. The abbreviations are: Crit, Erro, Warn, Noti, Info, Summ, Verb, and Data. These correspond to: Critical, Error, Warning, Notice, Informational, Debug-Summary, Debug-Verbose, and Debug-Data.

Source Line

For providing detailed information to technical support, the application source file names and line numbers detecting the events can be displayed by specifying source-line. The default setting is off. You must enable debug mode using the `enable log debug-mode` command to view the source line information. For messages generated prior to enabling debug mode, the source line information is not displayed.

Tag ID

The process-id of the (internal) ExtremeXOS process that generated the event that resulted in the log message can be displayed by specifying tag-id. The default setting is off.

Tag Name

The name of the log component to which the generated event belongs can be displayed by specifying tag-name. The default setting is on. The tag name would be the same as the output of event-name component.

Example

In the following example, the switch generates the identical event from the component *SNTP (Simple Network Time Protocol)*, using three different formats.

Using the default format for the session target, an example log message might appear as:

```
05/29/2005 12:15:25.00 <Warn:SNTP.RslvSrvrFail> The SNTP server parameter value
(TheWrongServer.example.com) can not be resolved.
```

If you set the current session format using the following command:

```
configure log target session format timestamp seconds date mm-dd-yyyy event-name component
```

The same example would appear as:

```
05/29/2005 12:16:36 <Warn:SNTP> The SNTP server parameter value
(TheWrongServer.example.com) can not be resolved.
```

To provide some detailed information to technical support, you set the current session format using the following command:

```
configure log target session format timestamp hundredths date mmm-dd event-name condition
source-line process-name
```

The same example would appear as:

```
May 29 12:17:20.11 SNTP: <Warn:SNTP.RslvSrvrFail> tSntpc: (sntpcLib.c:606) The SNTP
server parameter value (TheWrongServer.example.com) can not be resolved.
```

History

This command was first available in ExtremeXOS 10.1.

The ipPort and host-name parameters were first introduced in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target match

```
configure log target [console | memory-buffer | nvram | primary-node|
   backp-node | session | syslog [all | ipaddress {udp-port {udp_port}}
   | ipPort | ipaddress tls-port {tls_port} ] {vr vr_name} {local0 ...
   local7}] match [any |match-expression]
```

Description

Associates a match expression to a target.

In a stack, this command is applicable only on a Master and Backup nodes. This command is not applicable for standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-node	Specifies the primary node in a stack.
backup-node	Specifies the backup-node in a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local syslog facility.
any	Specifies that any messages will match. This effectively removes a previously configured match expression.
match-expression	Specifies a regular expression. Only messages that match the regular expression will be sent.

Default

By default, targets do not have a match expression. If a virtual router is not specified, *VR-Mgmt* is used.

Usage Guidelines

This command configures the specified target with a match expression. The filter associated with the target is not affected. A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified.

See the command `show log` for a detailed description of simple regular expressions. By default, targets do not have a match expression.

Specifying any instead of match-expression effectively removes a match expression that had been previously configured, causing any message to be sent that has satisfied all of the other requirements.

To see the configuration of a target, use the following command:

```
show log configuration target {console | memory-buffer | nvram |
primary-node | backup-node | session | syslog {ipaddress {udp-port
{udp_port }}| ipPort |ipaddress tls-port {tls_port}} {vr vr_name}
{[local0...local7]}}
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {filter name}
```

Example

The following command sends log messages to the current session, that pass the current filter and severity level, and contain the string user5:

```
configure log target session match user5
```

History

This command was first available in ExtremeXOS 10.1.

The *ipPort* parameter was first available in ExtremeXOS 11.1.

The **udp-port** parameter was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target memory-buffer alert percent-full

```
configure log target memory-buffer alert percent-full [ percent | none ]
```

Description

This command configures the log buffer threshold alert.

Syntax Description

percent-full	Generate a log event when the memory buffer percentage fully exceeds the specified percentage threshold.
percent	Percent-full threshold to generate a log event [50-100].
none	No alert.

Default

None.

Usage Guidelines

Use this command to configure the log buffer threshold alert.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target severity

```
configure log target [console | memory-buffer | nvram |primary-
   node |backup-node | session | syslog [all | ipaddress {udp-port
   {udp_port}} | ipPort | ipaddress tls-port {tls_port} ] {vr vr_name}
   {local0...local7 }] {severity severity {only}}
```

Description

Sets the severity level of messages sent to the target.

In a stack, this command is applicable only to Master and Backup nodes. You cannot run this command on standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-node	Specifies the primary node in a stack.
backup-node	Specifies the backup node in a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local syslog facility.

severity	Specifies the least severe level to send (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be sent.

Default

By default, targets are sent messages of the following severity level and above:

- console display—info
- memory buffer—debug-data
- NVRAM—warning
- session—info
- syslog—debug-data
- primary node—warning (stack only)
- backup node—warning (stack only)

If a virtual router is not specified, *VR-Mgmt* is used.

Usage Guidelines

This command configures the specified target with a severity level. The filter associated with the target is not affected. A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified.

See the command `show log` for a detailed description of severity levels.

To see the current configuration of a target, use the following command:

`show log configuration target {`**`console`** | **`memory-buffer`** | **`nvram`** | **`primary-node`** | **`backup-node`** | **`session`** | **`syslog`** {*ipaddress* {**`udp-port`** {*udp_port* }}| *ipPort* |*ipaddress* **`tls-port`** {*tls_port*}} {**`vr`** *vr_name*} {[**`local0...local7`**]}}

To see the current configuration of a filter, use the following command:

`show log configuration filter {`*filter name*`}`

Example

The following command sends log messages to the current session, that pass the current filter at a severity level of info or greater, and contain the string user5:

```
configure log target session severity info
```

History

This command was first available in ExtremeXOS 10.1.

The *ipPort* parameter was first available in ExtremeXOS 11.1.

The **udp-port** parameter was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target syslog

```
configure log target syslog [all | ipaddress {udp-port {udp_port}}
   | ipPort | ipaddress tls-port {tls_port}] {vr vr_name}
   {local0...local7} from source-ip-address
```

Description

This command specifies the source-ip-address to use when sending log messages to the Syslog server. The Syslog server's IP address along with the ipPort and local facility (a tuple) identify which Syslog server target is to be configured.

Syntax Description

syslog	Specifies a Syslog target.
all	Specifies all of the remote Syslog servers.
ipaddress	Specifies the Syslog server's IP address.
udp-port	Remote Syslog server UDP port. Default 514.
udp_port	UDP port number.
ipPort	Specifies the UDP port number for the Syslog target.
tls_port	Specifies remote Syslog server Transport Layer Security (TLS) for connection type.
tls_port	TLS port number.
vr_name	Specifies the virtual router that can reach the server IP address. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
local0 ... local7	Specifies the local Syslog facility.
source-ip-address	Specifies the local source IP address to use. Note: The address family (i.e IPv4 or IPv6) of the specified source IP address must be the same as the address family of the Syslog server's.

Default

If a virtual router is not specified, the following virtual routers are used:

- ExtremeXOS 10.1—VR-0

- ExtremeXOS 11.0 and later—*VR-Mgmt*

Usage Guidelines

Use this command to identify and configure the Syslog server's IP address. By configuring a source IP address, the Syslog server can identify from which switch it received the log message.

If you do not configure a source IP address for the Syslog target, the switch uses the IP address in the configured VR that has the closed route to the destination.

Example

The following command configures the IP address for the specified Syslog target:

```
configure log target syslog 10.12.1.15 from 10.234.56.78
configure log target syslog 2001:12:1::1 from 2001:44::1
```

History

This command was first available in ExtremeXOS 10.1.

The **udp-port** parameter and support for the EMS to send log messages to Syslog servers having IPv6 address was added in ExtremeXOS 21.1.

Transport Layer Security (TLS) option added in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure log target upm filter

```
configure log target upm {upm_profile_name} filter filter-name {severity
   [[severity] {only}]}
```

Description

Configures a log target to receive events that conform to a specific EMS filter and severity level requirements.

Syntax Description

upm_profile_name	Specifies a UPM log target to configure.
filter-name	Assigns an EMS filter to the specified log target.
severity	Specifies the minimum severity level for events sent to the log target.
only	Specifies that only events at the specified severity are sent to the log target.

Default

N/A.

Usage Guidelines

Events that meet the criteria established in the EMS filter and the optional severity requirements are forwarded to the UPM log target profile. You can further restrict the forwarded events with the following command:

`configure log target upm {upm_profile_name} match {any |regex}`.

Example

The following example configures UPM log target testprofile1 to receive events that meet the criteria defined in EMS filter testfilter1:

```
configure log target upm testprofile1 filter testfilter1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure log target upm match

`configure log target upm {upm_profile_name} match {any | regex}`

Description

Configures a log target to receive only those events that meet the specified match criteria.

Syntax Description

upm_profile_name	Specifies the UPM log target to be configured.
any	Matches any event. Use this option to remove a limitation configured with the *regex* option.
regex	Specifies an expression that must be contained in all forwarded events.

Default

N/A.

Usage Guidelines

This command further restricts the events selected by the command: `configure log target upm {upm_profile_name} filter filter-name {severity [[severity] {only}]}`.

Example

The following example configures UPM log target testprofile1 to receive events that meet the criteria contain the text warning:

```
configure log target upm testprofile1 match warning
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure log target xml-notification filter

```
configure log target xml-notification xml_target_name filter filter-name
   {severity [[severity] {only}]}
```

Description

Configures a Web server target with an EMS filter.

Syntax Description

xml_target_name	Specifies the name of the xml notification target.
filter-name	Specifies the name of the EMS filter.
severity	Specifies the least severe level to send (if the keyword only is omitted).

Default

N/A.

Usage Guidelines

Use this command to configure a Web server target with an EMS filter. All EMS filters can be applied.

Example

The following command configures the Web server target test2 with EMS filter filtertest2:

```
configure log target xml-notification test filter filtertest2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-lockdown-timeout ports aging-time

```
configure mac-lockdown-timeout ports [all | port_list] aging-time
   seconds
```

Description

Configures the MAC address lock down timeout value in seconds for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.
seconds	Configures the length of the time out value in seconds. The default is 15 seconds; the range is 15 to 2,000,000 seconds.

Default

The default is 15 seconds.

Usage Guidelines

This timer overrides the *FDB* aging time.

This command only sets the duration of the MAC address lock down timer. To enable the lock down timeout feature, use the following command:

```
enable mac-lockdown-timeout ports [all | port_list]
```

Example

The following command configures the MAC address lock down timer duration for 300 seconds for ports 2:3, 2:4, and 2:6:

```
configure mac-lockdown-timeout ports 2:3, 2:4, 2:6 aging-time 300
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports first-arrival aging

```
configure mac-locking ports port_list first-arrival aging [enable |
   disable]
```

Description

Enables and disables the aging of first-arrival MAC addresses.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
enable	MAC addresses aged out from the forwarding database are removed from MAC locking.
disable	MAC addresses aged out from the forwarding database are not removed from MAC locking.

Default

First-arrival MAC lock aging is disabled by default.

Usage Guidelines

This command does not apply to MAC addresses locked by static locking.

When enabled, first-arrival MAC addresses that are aged out of the forwarding database are removed from the associated port MAC lock. New MAC addresses can be learned until the configured first-arrival limit is reached.

Example

The following command enables first-arrival MAC lock aging on port 2:3:

```
configure mac-locking ports 2:3 first-arrival aging enable
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports first-arrival limit-learning

```
configure mac-locking ports port_list first-arrival limit-learning
   learn_limit
```

Description

Configures dynamic MAC locking on a port by restricting MAC locking on a port to a maximum number of end station addresses first connected to that port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
learn_limit	Specifies the maximum number of first-arrival end station MAC addresses that can be connected to the port. Valid values are 0–600.

Default

600 first-arrival end station MAC addresses

Usage Guidelines

When the configured limit is reached, no further entries are learned. If, however, the learned entries are aged out, new MAC addresses can be learned.

You cannot specify a value that is lower than the number of MACs locked in the MAC lock station table.

Example

The following example configures 400 as the maximum number of first-arrival MAC addresses that can connect to port 14.

```
configure mac-locking ports 14 first-arrival limit-learning 400
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports first-arrival link-down-action

```
configure mac-locking ports port_list first-arrival link-down-action
   [clear-macs | retain-macs]
```

Description

Clears or retains first arrival MAC locking addresses when the link goes down.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
clear-macs	First arrival MAC locking addresses will be cleared when the link goes down.
retain-macs	First arrival MAC locking addresses will be retained when the link goes down.

Default

When the link goes down, by default, all the first arrival MAC locking addresses will be removed (cleared).

Usage Guidelines

If you specify retain-macs, the first arrival MAC locking addresses will be retained even when the link goes down.

Example

The following example disables the clearing of first arrival MAC locking addresses on port 14.

```
configure mac-locking ports 14 first-arrival link-down-action retain-macs
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports first-arrival move-to-static

```
configure mac-locking ports port_list first-arrival move-to-static
```

Description

Moves all current first-arrival MAC locking addresses to static entries.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A

Usage Guidelines

This command converts dynamic MAC locked station entries to static MAC locked entries. The static MAC locked entries are saved in configuration and preserved across reboots.

This command does not convert the forwarding database entries to static-permanent entries.

Example

The following example converts the dynamic MAC locked station entries on port 14 to static MAC locked entries.

```
configure mac-locking ports 14 first-arrival move-to-static
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports learn-limit-action

```
configure mac-locking ports port_list learn-limit-action [disable-port |
   remain-enabled]
```

Description

Configures a port to be disabled or remain enabled when the port learns the configured maximum number of MACs.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
disable-port	Disables the port when the configured MAC limit is reached.
remain-enabled	Port remains enabled after the configured MAC limit is reached.

Default

The port remains enabled after the configured MAC limit is reached.

Usage Guidelines

This command is used for both first arrival and static MAC locking methods.

Example

The following example configures port 14 to be disabled when the configured MAC limit is reached.

```
configure mac-locking ports 14 learn-limit-action disable-port
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports log

```
configure mac-locking ports port_list log {violation | threshold} [on |
   off]
```

Description

Enables or disables the sending of a syslog message for MAC lock messages.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
violation	Sends a syslog message if the maximum value configured for dynamic and static MAC locking is exceeded.
threshold	Sends a syslog message if the maximum value configured for dynamic and static MAC locking is reached.
on	Sending a syslog message for the specified event is enabled.
off	Sending a syslog message for the specified event is disabled.

Default

If neither **violation** nor **threshold** is specified, violation is used by default.

Usage Guidelines

When MAC locking violations are enabled, the device sends a syslog message if a connected end station exceeds the maximum value configured for dynamic and static MAC locking.

When MAC locking thresholds are enabled, the device sends an syslog message if a connected end station reaches the maximum value configured for dynamic and static MAC locking.

Example

The following example enables threshold syslog messages on port 14.

```
configure mac-locking ports 14 log threshold on
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports static delete station

```
configure mac-locking ports port_list static delete station
   [station_mac_address | all]
```

Description

Deletes MAC locking for all MAC address or the specified MAC address on the specified port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
station_mac_address	Specifies the MAC address from which MAC locking will be deleted.
all	Deletes MAC locking from all MAC addresses associated with the specified port.

Default

N/A

Usage Guidelines

None.

Example

The following example deletes MAC locking from the MAC address 00-a0-c9-0d-32-11 on port 14.

```
configure mac-locking ports 14 static delete station 00-a0-c9-0d-32-11
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports static limit-learning

`configure mac-locking ports` *`port_list`* **`static limit-learning`** *`learn_limit`*

Description

Restricts MAC locking on a port to a maximum number of static (management defined) MAC addresses for end stations connected to this port.

Syntax Description

`port_list`	Specifies one or more ports or slots and ports.
`learn_limit`	Specifies the maximum number of static end station MAC addresses that can be connected to the port. Valid values are 0–64.

Default

64 static end station MAC addresses.

Usage Guidelines

When the configured limit is reached, no further entries are learned. If, however, the learned entries are aged out, new MAC addresses can be learned.

You cannot set a value that is lower than the number of MACs locked in the MAC lock station table.

You cannot configure the learning limit on both a port and a port-*VLAN*. If the learning limit is configured on a port, configuration on a port-VLAN will is not allowed. Similarly, if the learning limit is configured on a port-VLAN, configuration on port is not allowed.

Example

The following example configures 40 as the maximum number of static MAC addresses that can connect to port 14.

```
configure mac-locking ports 14 static limit-learning 40
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports static

```
configure mac-locking ports port_list static [add | enable | disable]
   station station_mac_address
```

Description

Creates, enables, and disables a static MAC locking entry.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
add	Adds a MAC locking association between the specified MAC address and port.
enable	Enables an existing MAC locking association between the specified MAC address and port.
disable	Disables an existing MAC locking association between the specified MAC address and port.
station_mac_address	Specifies the MAC address.

Default

A static MAC locking association is enabled by default.

Usage Guidelines

Up to 64 MAC addresses can be locked per port.

When added and enabled, a static MAC lock configuration allows only the end station designated by the MAC address to participate in frame relay.

Disabled entries are counted when calculating the total number of locked stations.

Example

The following example creates a MAC locking association between port 14 and 00-a0-c9-0d-32-11.

```
configure mac-locking ports 14 static add 00-a0-c9-0d-32-11
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mac-locking ports trap

```
configure mac-locking ports port_list trap {violation | threshold} {on |
   off}
```

Description

Enables or disables the sending of an *SNMP* trap for MAC lock messages.

Syntax Description

violation	Sends an SNMP trap if the maximum value configured for dynamic and static MAC locking is exceeded.
threshold	Sends an SNMP trap if the maximum value configured for dynamic and static MAC locking is reached.
on	Sending an SNMP trap for the specified event is enabled.
off	Sending an SNMP trap for the specified event is disabled.

Default

If neither **violation** nor **threshold** is specified, violation is used by default.

Usage Guidelines

When MAC locking violations are enabled, the device sends an SNMP trap if a connected end station exceeds the maximum value configured for dynamic and static MAC locking.

When MAC locking thresholds are enabled, the device sends an SNMP trap if a connected end station reaches the maximum value configured for dynamic and static MAC locking.

Example

The following example enables threshold traps on port 14.

```
configure mac-locking ports 14 trap threshold on
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure macsec cipher-suite

```
configure macsec cipher-suite [gcm-aes-128 | gcm-aes-256] ports
   port_list
```

Description

Configures the preferred cipher suite for MAC Security (MACsec).

Syntax Description

cipher-suite	Selects provisioning MACsec cipher suite to be used if elected as key server.
gcm-aes-128	Galois/Counter Mode of AES-128 symmetric block cipher (Default).
gcm-aes-256	Galois/Counter Mode of AES-256 symmetric block.
ports	Specifies configuring ports.
port_list	Lists which ports to configure the selected cipher suite on.

Default

The cipher suite **gcm-aes-128** is selected by default.

Usage Guidelines

Table 14: Cipher Support

GCM-AES-256 and GCM-AES-128	
Ports with LRM/MACsec Adapter	
ExtremeSwitching 5320, 5420, 5720 on all ports. ExtremeSwitching 5520 on all ports, except 5520-VIM-4X and 24X 10G ports.	

If GCM-AES-256 is desired between two switches using the LRM/MACsec Adapter, you need to issue this command on at least the key server side, but preferably on both sides.

If the port is elected as MKA key server, then the configured cipher suite is used to protect all port traffic. If the peer port is elected as MKA key server, then the peer chooses which cipher suite to use.

Example

The following example selects the gcm-aes-256 cipher suite on ports 22, 30–33:

```
# configure macsec cipher-suite gcm-aes-256 22,30-33
```

The following example selects the gcm-aes-128 cipher suite on port 30:

```
# configure macsec cipher-suite gcm-aes-128 30
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec connectivity-association

```
configure macsec connectivity-association ca_name [pre-shared-key {ckn
   ckn} {cak [encrypted encrypted_cak] | cak} | ports [port_list]
   [enable | disable]]
```

Description

Configures a previously created connectivity-association (CA) object that holds MAC Security (MACsec) key authentication data. For a particular CA, you can change the pre-shared key and enable/disable authentication on one or more ports.

Syntax Description

connectivity-association	Secures connectivity provided between MACsec stations.
ca_name	Selects CA object to configure.
pre-shared-key	Selects static MACsec key consisting of both a CKN and CAK:

ckn	Selects changing the CA key name. This public (non-secret) key name allows each of the MKA participants to select which connectivity association key (CAK) to use to process a received MACsec key agreement (MKA) protocol packets (MKPDU).
ckn	Sets the CA key name. Length allowed is 1–32 characters, entered as ASCII or an octet string preceded with 0x.
cak	Sets the connectivity association key (CAK). If you are using 256-bit cipher suite, then the CAK must be 32 octets. The 128-bit cipher suite can use either a 16- or 32-octet CAK. This is a long-lived secret key used to derive short-lived lower-layer keys (ICK, KEK, and SAK) that are used for key distribution and data encryption.
cak	Sets the non-encrypted CAK value. Must be entered as an octet string (for example: "0x859e72f0..."). A 128-bit (16 octet) CAK requires 32 hexadecimal digits, and a 256-bit (32 octet) CAK requires 64 hexadecimal digits. These values are secret and should be generated off switch with a suitable pseudorandom number generator.
encrypted	Designates that secret key value is in encrypted format.
encrypted_cak	Sets the value for the secret key. The encrypted CAK value is generated by the `show configuration macsec` command for previously configured CAKs.
ports	Specifies configuring ports.
port_list	Lists which ports to configure.
enable	Enable the MKA connectivity association on the selected port list.
disable	Disables the MKA connectivity association on the selected port list.

Default

N/A.

Usage Guidelines

You can only enable/disable CAs on ports that support MACsec.

If execution of this command results in MACsec being enabled on more than 48 ports for a given 5320 or 5420 series switch, then the command will fail.

Example

The following example sets CKN to "the red key" and CAK to a 128-bit key "0x0102030405060708091011121314151 6" for CA object "testca":

Note

The CAK shown here is an example. Use your own random number for maximum security.

```
configure macsec connectivity-association testca pre-shared-key ckn "the red key" cak
"0x0102030405060708091011121314151 6"
```

The following example enables MACsec authentication on port 13 for CA object "testca":

```
# configure macsec connectivity-association testca ports 13 enable
```

The following example disables MACsec authentication on port 13 for CA object "testca":

```
# configure macsec connectivity-association testca ports 13 disable
```

History

This command was first available in ExtremeXOS 30.1.

Support for 256-cipher suite was added in ExtremeXOS 30.2.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec include-sci

```
configure macsec include-sci [enable | disable] ports port_list
```

Description

Configures the include-SCI flag to ensure interoperability with third-party devices that do not decode encrypted MAC Security (MACsec) packets when the SCI is not present.

Syntax Description

include-sci	Provision inclusion of SCI in SecTAG field while transmitting MACsec frames.
enable	Include SCI in SecTAG.
disable	Do not include SCI in SecTAG (Default).
ports	Specifies configuring ports.
port_list	Lists which ports to configure the include-SCI flag on.

Default

Disabled by default (SCI is not included in MAC Security Tag (SecTAG)).

Usage Guidelines

The SecTAG appended to each data packet contains an optional parameter called Secure Channel Indicator (SCI). The SCI is used to identify the sending Secure Association (SA) when the connectivity-association (CA) comprises three or more peers.

Because ExtremeXOS only supports point-to-point links (which have exactly two peers), the SCI is not sent by default (which saves 8-octets per SecTAG'd packet). Certain third-party MACsec devices, such as the CentOS's MACsec client and Cisco Catalyst 3650, fail to decode encrypted MACsec packets when the SCI is not present. To ensure interoperability with such devices, you can configure the Include-SCI flag. When this flag is set, the port always includes the 8-octet SCI in the SecTAG of all outgoing packets.

Important
After enabling MACsec, if you change the include-SCI flag, you must run the `configure macsec` **`initialize ports`** *`port_list`* command afterward. Otherwise, the change is not applied.

Example

The following example enables including SCI in SecTAG field while transmitting MACsec frames on port 13:

```
configure macsec include-sci enable port 13
```

The following example disables including SCI in SecTAG field while transmitting MACsec frames on port 44:

```
# configure macsec include-sci disable port 44
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.

Platform	Ports
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec initialize ports

```
configure macsec initialize ports port_list
```

Description

Resets the MAC Security (MACsec) Key Agreement (MKA) protocol state machine on one or more ports and applies MACsec configuration changes to already enabled ports.

Syntax Description

initialize	Selects resetting the MACsec Key Agreement protocol state machine.
ports	Specifies configuring ports.
port_list	Lists which ports to reset the MACsec Key Agreement protocol state machine on.

Default

N/A.

Usage Guidelines

Issuing this command resets the MKA state machine, which in turn deletes any secured channels and their secure association keys (SAKs). This command is also used to apply MACsec configuration changes (mka actor-priority, include-sci, replay-protect, mka life-time) to an already enabled port. All traffic is blocked until MKA renegotiates a new set of keys and those keys are installed. For more information, see *IEEE802.1X-2010 Clause 12.9.3 Initialization*.

Example

The following example resets the MACsec Key Agreement protocol state machine on port 13:

```
configure macsec initialize ports 13
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec mka actor-priority

`configure macsec` **`mka actor-priority`** *`actor_priority`* **`ports`** *`port_list`*

Description

Configures MAC Security (MACsec) actor's priority for port(s).

Syntax Description

`mka`	Configures MACsec key agreement (MKA) parameters.
`actor-priority`	Designates setting the priority advertised during MKA key server election.
`actor-priority`	Sets the actor priority value. A lower value denotes higher priority.Range is 0–255 or 0x0–0xFF. Default is 0x10.
`ports`	Specifies configuring ports.
`port_list`	Lists which ports to configure the actor priority on.

Default

Default value for actor priority is 0x10.

Usage Guidelines

Each MKA participant selects the participant advertising the highest priority as the key server. In the event of a tie, the participant with the highest priority MAC address (lowest value) is selected. The recommended priority range for infrastructure ports is 0x00 to 0x1f, with a default of 0x10. You can assign the full range of priorities, 0x00 to 0xff:

- To *have* a port become a key server, raise the priority by assigning a priority value *less* than 0x10.

- To *not* have a port become key server, lower the priority by assigning a priority value *greater* than 0x10.

Important
After enabling MACsec, if you change the actor priority, you must run the `configure macsec` **`initialize ports`** *`port_list`* command afterward. Otherwise, the change is not applied.

Example

The following example raises the actor priority value to 0x5 on port 13:

```
# configure macsec mka actor-priority "0x5" port 13
# configure macsec initialize port 13
```

The following example lowers the actor priority value to "31" on port 14:

```
# configure macsec mka actor-priority 31 port 14
# configure macsec initialize port 14
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec mka life-time

`configure macsec` **`mka life-time`** *`mka_life_time`* **`ports`** *`port_list`*

Description

Configures MAC Security (MACsec) lifetime for port(s).

Syntax Description

mka	Configures MACsec key agreement (MKA) parameters.
life-time	Designates setting the lifetime of potential and live peers. Expiration causes removal from a list, and higher intervals increase MKA protocol stability.
mka_life_time	Sets the lifetime of potential and live peers. Range is 6-30. Default is 6 seconds.
ports	Specifies configuring ports.
port_list	Lists which ports to configure the actor priority on.

Default

Default value for life-time 6 seconds.

Usage Guidelines

If MACsec link flap occurs, loosen the `life-time` equally on both sides of the MACsec connection.

Note
MACsec link flap is likely to only occur on links connected to lower-end switches (the ExtremeSwitching X620 switch, for example).

Important
After enabling MACsec, if you change the MKA lifetime, you must run the `configure macsec` **`initialize ports`** *`port_list`* command afterward. Otherwise, the change is not applied.

Example

The following configures the MKA lifetime to 10 seconds on port 3:

```
# configure macsec mka life-time 10 port 3
# configure macsec initialize port 3
```

History

This command was first available in ExtremeXOS 31.5.

Platform Availability

This command is available on the following platforms:

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure macsec replay-protect

```
configure macsec replay-protect [window_size_in_packets | disable] ports
   port_list
```

Description

Configures MAC Security (MACsec) replay-protect window size for port(s).

Syntax Description

replay-protect	Configures dropping out-of-order packets received on a port.
window_size_in_packets	Sets replay-protect window size value. Out-of-order packets up to selected value are accepted. Range is 0–4,294,967,295. Default is 0 (out-of-order packets are dropped).
disable	Disables replay protection. Out-of-order packets are allowed.
ports	Specifies configuring ports.
port_list	Lists which ports to configure the replay-protect window on.

Default

Default value for replay-protect window is 0 packets, which drops all out-of-order packets.

Usage Guidelines

The replay protection feature provides for the dropping of out-of-order packets received on a port. The window size is set to 0 by default, meaning any packet received out-of-order is dropped. Setting the window size to non-zero sets the range of sequence numbers that are tolerated, to allow receipt of

packets that have been misordered by the network. If replay protection is disabled, packet sequence numbers are not checked and out-of-order packets are not dropped.

Important
After enabling MACsec, if you change the replay protect window size, you must run the `configure macsec` **`initialize ports`** *`port_list`* command afterward. Otherwise, the change is not applied.

Example

The following example disables replay protection on port 13:

```
# configure macsec replay-protect disable port 13
# configure macsec intialize port 13
```

The following example sets replay-protect window size to 50 packets on port 14. If the last data packet received has a packet number (PN) of N, then the next received packet is accepted if its PN is greater than or equal to N-50. If the PN is less than N-50, the packet is dropped and the "Late Pkts" counter is incremented:

```
# configure macsec replay-protect 50 port 14
# configure macsec intialize port 14
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is available on the following platforms.

Note
The MACsec feature requires the installation of the MAC Security feature pack license.

Platform	Ports
ExtremeSwitching 5320	All ports of all models except stacking ports.
ExtremeSwitching 5420	All ports of all models except stacking ports.
ExtremeSwitching 5520	All ports, except 5520-VIM-4X and 5520-24X 10G ports
ExtremeSwitching 5720	All ports of all models except stacking ports.

configure mcast ipv4 cache timeout

`configure mcast ipv4 cache timeout {`*`seconds`* `|` **`none`**`}`

Description

Configures the IPv4 multicast cache timeout.

Syntax Description

seconds	Idle time after which cache entries are deleted.
none	Cache entries are not timed out.

Default

300 seconds.

Usage Guidelines

Cache timeout is the time after which the cache entries are deleted if traffic is not received for that duration. This applies only for snooping and MVR caches and does not apply for PIM caches.

The range is 90 to 100000 seconds. You can use the option **none** if you do not want the cache entry to be deleted. If **none** is configured, the cache entries can be deleted only using the following command:

```
clear igmp snooping
```

Example

The following example configures the IPv4 multicast cache timeout to 400 seconds.

```
configure mcast ipv4 cache timeout 400
```

The following command clears he IPv4 multicast cache timeout.

```
configure mcast ipv4 cache timeout none
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *IGMP* snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mcast ipv6 cache timeout

```
configure mcast ipv6 cache timeout {seconds | none}
```

Description

Configures the IPv6 multicast cache timeout.

Syntax Description

seconds	Idle time after which cache entries are deleted.
none	Cache entries are not timed out.

Default

300 seconds.

Usage Guidelines

Cache timeout is the time after which the cache entries are deleted if traffic is not received for that duration. This applies only for snooping and MVR caches and does not apply for PIM caches.

The range is 90 to 100000 seconds. You can use the option **none** if you do not want the cache entry to be deleted. If **none** is configured, the cache entries could be deleted only using the following command:

```
clear igmp snooping
```

Example

The following example configures the IPv6 multicast cache timeout to 400 seconds.

```
configure mcast ipv6 cache timeout 400
```

The following command clears he IPv6 multicast cache timeout.

```
configure mcast ipv6 cache timeout none
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure meter

```
configure meter metername {committed-rate cir [Gbps | Mbps | Kbps
   | Pps]} {max-burst-size burst-size [Kb | Mb | packets]} {out-
   actions [{disable-port} {drop | set-drop-precedence {dscp [none |
   dscp-value]} {dot1p [ none | dot1p-value ]}} {log} {trap}]} {ports
   [port_group | port_list]}
```

Description

Configures an *ACL* meter to provide ingress traffic rate shaping.

Syntax Description

metername	Specifies the ACL meter name.
committed-rate	Specifies the committed information rate in gigabits per second (Gbps), megabits per second (Mbps), or kilobits per second (Kbps).
max-burst-size	Specifies the maximum burst size or peak burst size in kilobits (Kb) or megabits (Mb).
out-actions	Specifies actions to take if traffic exceeds the profile.
drop	Specifies to drop out of profile traffic.
set-drop-precedence	Specifies to mark packet for high drop precedence.
dscp	Specifies to set DSCP.
dscp-value	DSCP value (0-63).
none	Specifies to leave the DSCP or dot1p value unchanged.
dot1p	Specifies dot1p value to be set.
dot1p-value	Dot1p value (0-7).
log	Generate log event if trafic exceeds configured rate.
trap	Generate *SNMP* trap if traffic exceeds configured rate.
ports	Meter configuration is applicable to ports in the specified port_group or port_list.
port_group	Port group name.
port_list	Port list separated by a comma.

Default

By default, a newly committed meter has no maximum burst size, no committed rate, and a default action of drop.

Usage Guidelines

The meter configured with this command is associated with an ACL rule by specifying the meter name using the meter action modifier within the rule.

The committed-rate keyword specifies the traffic rate allowed for this meter, and the configured rate operates as described in Table 15. The rate you specify is rounded up to the next granularity increment value. For example, if you configure a 1 Mbps committed rate for a platform with a 64Kbps granularity increment, this value falls between the increment values of 960 Kbps and 1024 Kbps, so the effective

committed rate is set to 1024 Kbps. Also, note that some platforms listed below require an adjustment to the expected rate to calculate the configured rate.

Table 15: Rate Configuration Notes

Platform	Granularity	Notes
All platforms	64Kbps	Specify the traffic rate in Kbps, Mbps, or Gbps. The range is 64Kbps to 1 Gbps for GE ports and 1Mbps to 10 Gbps for 10GE ports. Add 20 bytes per frame to the expected rate to determine the configured rate.

The max-burst-size keyword specifies the maximum number of consecutive bits that are allowed to be in-profile at wire-speed. The max-burst-size parameter can be specified in Kb, Mb, or Gb. The specified max-burst-size is rounded down to the nearest supported size. The max-burst-size range on ExtremeSwitching switches is 32Kb to 128Mb.

The keyword out-actions specifies the action that is taken when a packet is out-of-profile. The supported actions include dropping the packet, marking the drop precedence for the packet, setting the DSCP value in the packet, or setting the DOT1P value in the packet. The keyword drop indicates that any out-of-profile packet is immediately dropped. The keyword set-drop-precedence marks out-of-profile packets with high drop precedence. If the optional keyword set-dscp is specified, the DSCP value, as specified by the parameter *dscp-value*, is written into the out-of-profile packet. Setting the DSCP value to none leaves the DSCP value in the packet unchanged. If the optional keyword set-dot1p is specified, the DOT1P value, as specified by the parameter *dot1p-value*, is written into the out-of-profile packet. Setting the DOT1P value to none leaves the DOT1P value in the packet unchanged.

Example

The following example configures the ACL meter maximum_bandwidth, assigns it a rate of 10 Mbps, and sets the out of profile action to drop:

```
configure meter maximum_bandwidth committed-rate 10 Mbps out-action drop
```

The following example uses the *port_groups* variable:

```
configure meter ingmeter0 committed-rate 50 Mbps out-actions drop log disable-port ports
GroupA
configure meter ingmeter1 committed-rate 75 Mbps out-actions drop log disable-port ports
GroupA
configure meter ingmeter0 committed-rate 100 Pps out-actions drop log disable-port ports
GroupB
configure meter ingmeter1 committed-rate 150 Pps out-actions drop log disable-port ports
GroupB
```

History

This command was available in ExtremeXOS 11.1.

The **log**, **trap** and **ports** keywords and *port-group* and *port_list* variables were added in ExtremeXOS 16.1

The **dot1p** keyword and variable were added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror add

```
configure mirror { mirror_name} add [ {vlan} vlan_name | vlan vlan_id]
   {ingress | [port port {ingress}}| ip-fix | port port vlan [vlan_id |
   vlan_name ] {ingress}]
```

Description

Specifies mirror source filters for an instance.

Syntax Description

mirror_name	Specifies the mirror's name.
vlan	Specifies a *VLAN*.
vlan_id	Specifies a VLAN ID.
port	Specifies a port or slot and port.
port	Specifies particular ports or slots and ports.
ingress	Specifies packets be mirrored as they are received on a port. Note: This parameter is available only with port-based mirroring.
ip-fix	Enables mirroring of the first fifteen packets of every IPFIX flow.
egress	Specifies packets be mirrored as they are sent from a port. Note: This parameter is available only with port-based mirroring.
ingress-and-egress	Specifies all forwarded packets be mirrored. This is the default for port-based mirroring. Note: This parameter is available only with port-based mirroring.

Default

N/A.

Usage Guidelines

You must enable port-mirroring using the `enable mirroring to port` command before you can configure the mirroring filter definitions.

Port mirroring configures the switch to copy all traffic associated with one or more ports to a monitor port on the switch. The switch uses a traffic filter that copies a group of traffic to the monitor port.

Up to 128 mirroring filters can be configured with the restriction that a maximum of 16 of these can be configured as VLAN and/or virtual port (port + VLAN) filters.

One monitor port or 1 monitor port list can be configured. A monitor port list may contain up to 16 ports.

Frames that contain errors are not mirrored.

For general guideline information and information for various platforms, see "Guidelines for Mirroring" in the *Switch Engine 32.2 User Guide* or the Usage Guidelines of the `enable mirroring to port` command.

Example

The following example sends all traffic coming into a switch on port 11 and the VLAN default to the mirror port:

```
configure mirror add port 11 vlan default
```

History

This command was first available in ExtremeXOS 15.3.

The *vlan_id* option was added in ExtremeXOS 16.1.

The **ip-fix** option was added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror add ports anomaly

`configure mirror add ports` *port_list* **anomaly**

Description

Mirrors detected anomaly traffic to the mirror port.

Syntax Description

port_list	Specifies the list of ports.

Default

N/A.

Usage Guidelines

The command mirrors detected anomaly traffic to the mirror port. You must enable a mirror port and enable protocol anomaly protection on the slot that has the port to be monitored before using this command. After configuration, only detected anomaly traffic from these ports are dropped or mirrored to the mirror port, and legitimate traffic is not affected.

This command takes effect after enabling anomaly-protection.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror control_index

```
configure mirror control_index [ add | delete ] mirror_name
```

Description

Adds or deletes existing mirrors to a mirror MIB instance (specified by a control index) .

Syntax Description

mirror_name	Specifies a specific mirror name to add to or delete from a mirror MIB instance.
control_index	Mirror destination control index (1–4). Also known as: etsysMirrorDestinationControlIndex. Each comprises a group of mirror names.
add	Specifies adding a mirror name to group referenced by a control index.
delete	Specifies deleting a mirror name from a group referenced by a control index.

Default

N/A.

Usage Guidelines

To use policy-based mirroring, you need a mirror MIB instance (designated by a control index) with one or more associated mirrors to apply mirrors to a policy profile.

Only mirrors with a single 'to' port or remote-ip can be applied to a mirror MIB instance.

Example

The following example adds existing mirror "mirror1" to mirror MIB instance with control index "2":

```
configure mirror 2 add mirror1
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror delete

```
configure mirror {mirror_name} delete [ {vlan} vlan_name | vlan vlan_id]
   {port port} | ip-fix | port port vlan [vlan_id | vlan_name]
```

Description

Deletes mirror source filters for an instance.

Syntax Description

mirror_name	Specifies the mirror's name.
port	Specifies a port or a slot and port.
port	Specifies particular ports or slots and ports.
ip-fix	Disables mirroring packets of IPFIX flows.
vlan	Specifies a *VLAN*.
vlan_id	Specifies a VLAN ID.
name	Specifies a VLAN name.

Default

N/A.

Example

The following example deletes the mirroring filter on port 1:

```
configure mirroring delete ports 1
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was added in ExtremeXOS 11.0.

The *vlan_id* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror description

```
configure mirror mirror_name description [ mirror-desc | none ]
```

Description

Creates, edits or deletes a mirroring instance description string.

Syntax Description

mirror_name	Specifies the mirror name.
description	Specifies the mirror description to create or edit.
none	Deletes the existing mirror description.

Default

N/A.

Usage Guidelines

Use this command to create, edit or delete a mirroring instance description string.

Example

The following example configures the mirror description.

```
configure mirror description
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror name

configure mirror *mirror_name* **name** *new_name*

Description

Updates or specifies the "to port" definitions for a named mirroring instance .

Syntax Description

mirror_name	Specifies the mirror name.
name	Specifies a new mirror name.
new_name	Specifies the new mirror name.

Default

N/A.

Usage Guidelines

Use this command to update or specify the "to port" definitions for a named mirroring instance.

Example

```
configure mirror m1 name m2
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror to

configure mirror *mirror_name* {**to** [**port** *port* | **port-list** *port_list* | **loopback port** *port*] **| remote-ip** {**add**} *remote_ip_address* {{**vr**} *vr_name* } {**from** [*source_ip_address* | **auto-source-ip**]} {**ping-check** [**on** | **off**]}] {**remote-tag** *rtag* | **port none**} {**priority** *priority_value*}

Description

Updates or specifies the "to port", "to port list", or remote IP address destination definitions for a named mirroring instance.

Syntax Description

mirror_name	Specifies the mirror name.
port	Specifies the mirror output port.
port-list	Specifies the list of ports where traffic is to be mirrored.
loopback port	Specifies an otherwise unused port required when mirroring to a port_list. The loopback-port is not available for switching user data traffic.
port	Specifies a single loopback port that is used internally to provide this feature.
remote-tag	Specifies the value of the *VLAN* ID used by the mirrored packets when egressing the monitor port.
port	Specifies the port definition for the mirroring instance.
none	Specifies none for the to port definition.
remote-ip	Sends mirrored packets to specified remote destination IP address.
remote_ip_address	Specifies the destination remote IP address for mirrored packets.
add	Adds a redundant (more than one) remote IP address with a unique priority to a mirror instance.
vr	Specifies the virtual router of the remote IP address.
vr_name	Specifies the virtual router name. If not specified, VR of current command context is used.
from	Configures source IP address of encapsulated mirrored packets.
source_ip_address	Specifies the local source IPv4 address for encapsulated mirrored packets.
auto-source-ip	Automatically use source IP address of egress VLAN to be used to reach remote IP address.
ping-check	Configure ping health check for remote IP address.
on	Only send mirrored packets to remote IP address if periodic pings to remote IP address are successful (default).
off	Send mirrored packets to remote IP address without any ping health check, assuming MAC address and port of next hop IP address are static or learned.
priority	Configures a unique priority value for each redundant remote IP address of a mirror instance.
priority_value	Sets a unique priority value for a remote IP address. The priority value must be unique for each remote IP address in the mirror instance. The range is from 1 (least preferred) to 100 (most preferred). The default is 50.

Default

Ping health check of the remote IP address is enabled unless otherwise specified.

If a VR is not specified, the VR of the current command context is used.

The default priority value for multiple redundant IP addresses is 50.

Usage Guidelines

Use this command to update, or specify the "to port", "to port-list", or remote IP address destination definitions for a named mirroring instance.

The **none** keyword can be used to remove a previously configured port/port-list , or remote IP address on a disabled mirror instance.

For high availability, you can add up to four redundant remote IP addresses. For each mirror instance, the remote IP address with the highest configured priority value that has status “up” is used as the destination IP address for GRE-tunneled mirrored traffic. All other remote IP addresses deemed “up” for that mirror instance are standby—ready to be used in the event the preferred remote IP address becomes “down”. If you are adding another (redundant) remote IP address to an existing mirror that already has a remote IP address configured, you must use the **add** option.

The **remote-ip** cannot be the IP from vr-mgmt.

You cannot specify vr-mgmt as VR.

Example

The following example configures a mirror instance to port 3, slot 4:

```
# configure mirror to port 3:4
```

The following example configures multiple (redundant) remote IP addresses ("5.1.1.2", "4.1.1.2", "3.1.1.2", "2.1.1.2") for mirror "analytics_chicago_1":

```
# enable mirror analytics_chicago_1 to remote-ip 5.1.1.2
# configure mirror analytics_chicago_1 to remote-ip add 4.1.1.2 priority 40
# configure mirror analytics_chicago_1 to remote-ip add 3.1.1.2 priority 30
# configure mirror analytics_chicago_1 to remote-ip add 2.1.1.2 priority 20
# configure mirror analytics_chicago_1 add vlan v1

# show mirror

analytics_chicago_1   (Enabled)
    Description:
    Mirror to remote IP: 5.1.1.2            VR        : VR-Default
    From IP            : Auto source IP     Ping check: On
    Priority           : 50
    Status             : Up. Active

    Mirror to remote IP: 4.1.1.2            VR        : VR-Default
    From IP            : Auto source IP     Ping check: On
    Priority           : 40
    Status             : Up. Standby

    Mirror to remote IP: 3.1.1.2            VR        : VR-Default
    From IP            : Auto source IP     Ping check: On
    Priority           : 30
    Status             : Down. Ping timed out

    Mirror to remote IP: 2.1.1.2            VR        : VR-Default
    From IP            : Auto source IP     Ping check: On
```

```
    Priority           : 20
    Status             : Up. Standby
    Source filter instances used :  1
        All ports, vlan v1, ingress only
```

History

This command was first available in ExtremeXOS 15.3.

The remote IP address option was added in ExtremeXOS 22.4.

Redundant remote IP addresses capability was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror to remote-ip delete

```
configure mirror {mirror_name to remote-ip delete [all |
   remote_ip_address {{vr} vr_name}] }
```

Description

Removes one or all of the redundant remote IP addresses from a mirror instance.

Syntax Description

mirror_name	Mirror instance name.
to	Selects mirroring to another location.
remote-ip	Send mirrored packets to specified destination IP address using L2 GRE encapsulation.
delete	Delete all or one remote IP addresses from a mirror instance.
all	Delete all remote IP addresses from a disabled mirror instance.
remote_ip_address	Delete the specified existing remote IP address from a mirror instance.
vr	Specifies a virtual router.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, the current CLI context is used.

Default

If a virtual router is not specified, the current CLI context is used.

Usage Guidelines

To delete all or the last remaining remote IP address, you must disable the mirror first (`disable mirror [mirror_name | all]`).

Example

The following example removes the remote IP address "1.1.3.3" from the mirror instance "m1":

```
# configure mirror m1 to remote-ip delete 1.1.3.3
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mirror to remote-ip protocol-type

```
configure mirror to remote-ip protocol-type [erspan-v1 | trans-ether-
   bridging | user-defined protocol_value]
```

Description

Adds a configurable GRE protocol type for mirror-to-remote IP addresses.

Syntax Description

mirror	Specifies configuring mirrors.
to	Selects mirroring to another location.
remote-ip	Sends mirrored packets to specified destination IP address using L2 GRE encapsulation.
protocol-type	Selects GRE protocol type in the header of mirrored packets to all remote IP addresses.
erspan-v1	Specifies GRE protocol type 0x88BE, Encapsulated Remote Switched Port Analyzer version 1, also known as ERSPAN type II (default).
trans-ether-bridging	Specifies GRE protocol type 0x6558, Trans Ether Bridging.
user-defined	Specifies GRE protocol type specified in hexadecimal (for example, 0x6558).
protocol_value	Specifes a user-defined, two-byte hexadecimal value for GRE protocol type (for example, 0x6558).

Default

By default, the type is **erspan-v1**.

Usage Guidelines

The configured value is global, and the new value is applied immediately in hardware for all active mirrors to remote IP addresses.

To view the current setting, use the `show mirror [mirror_name | control_index | mirror_name_li] | [all | enabled]` command.

Example

The following example sets the type as **trans-ether-bridging**:

```
# configure mirror to remote-ip protocol-type trans-ether-bridging
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer alternate ipaddress

`configure mlag peer peer_name alternate ipaddress ip_address vr vr_name | none`

Description

This command configures the IP address for alternate health check mechanism.

Syntax Description

mlag	Multi-switch Link Aggregation used to combine remote ports and local ports to a common logical connection.
peer	Multi-switch Link Aggregation Group peer switch.
peer_name	Alphanumeric string identifying the peer.
alternate	Health check on an alternate path.
ipaddress	MLAG peer IP address for alternate path health checks.
vr	Virtual router.
vr_name	Virtual router name.
none	Do not use alternate path health checks.

Default

None.

Usage Guidelines

Use this command to configure the IP address for alternate health check mechanism. Use the **none** option to unconfigure the configured IP.

Example

The following example displays `show mlag peer` output with the alternate path IP configured:

```
w4.10 # show mlag peer
Multi-switch Link Aggregation Peers:

MLAG Peer         : sw3
VLAN              : two                    Virtual Router    : VR-Default
Local IP Address  : 2100:51:2::4
Peer IP Address   : 2100:51:2::3
MLAG ports        : 1                  Tx-Interval       : 100 ms
Checkpoint Status : Up                 Peer Tx-Interval  : 100 ms
Rx-Hellos         : 13212              Tx-Hellos         : 13485
Rx-Checkpoint Msgs: 121                Tx-Checkpoint Msgs: 316
Rx-Hello Errors   : 0                  Tx-Hello Errors   : 0
Hello Timeouts    : 0                  Checkpoint Errors : 0
Up Time           : 0d:0h:17m:47s      Peer Conn.Failures: 0
Local MAC         : 00:04:96:51:ac:d7  Peer MAC          : 00:04:96:36:52:91
Config'd LACP MAC : None               Current LACP MAC  : 00:04:96:51:ac:d7
Authentication:   : md5
Authentication Key: .{:OFarc#'qX)+6zid#smIE+',+)ocijk   (encrypted)

Alternate path information:
VLAN              : Mgmt                   Virtual Router    : VR-Mgmt
Local IP Address  : 10.127.7.74            Peer IP Address   : 10.127.7.73
Rx-Hellos         : 243                    Tx-Hellos         : 551
Rx-Hello Errors   : 0                      Tx-Hello Errors   : 0
Hello Timeouts    : 1
```

When the alternate path IP is not configured, the following output is shown:

```
sw4.10 # show mlag peer
Multi-switch Link Aggregation Peers:

MLAG Peer         : sw3
VLAN              : two                    Virtual Router    : VR-Default
Local IP Address  : 2100:51:2::4
Peer IP Address   : 2100:51:2::3
MLAG ports        : 1                  Tx-Interval       : 100 ms
Checkpoint Status : Up                 Peer Tx-Interval  : 100 ms
Rx-Hellos         : 13212              Tx-Hellos         : 13485
Rx-Checkpoint Msgs: 121                Tx-Checkpoint Msgs: 316
Rx-Hello Errors   : 0                  Tx-Hello Errors   : 0
Hello Timeouts    : 0                  Checkpoint Errors : 0
Up Time           : 0d:0h:17m:47s      Peer Conn.Failures: 0
Local MAC         : 00:04:96:51:ac:d7  Peer MAC          : 00:04:96:36:52:91
Config'd LACP MAC : None               Current LACP MAC  : 00:04:96:51:ac:d7
Authentication:   : md5
Authentication Key: .{:OFarc#'qX)+6zid#smIE+',+)ocijk   (encrypted)

Alternate path information: None
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer authentication

```
configure mlag peer peer_name authentication [md5 key {encrypted
   encrypted_auth_key | auth_key } | none]
```

Description

Configures the *MD5* authentication key for checkpoint connection to peer.

Syntax Description

mlag	Multi-switch Link Aggregation Group used to combine remote ports and local ports to a common logical connection.
peer	Multi-switch Link Aggregation Group peer switch.
peer_name	Alphanumeric string identifying the MLAG peer.
authentication	Authentication for MLAG checkpoint connection.
md5	MD5 authentication type.
key	Authentication key for checkpoint connection to the MLAG peer.
encrypted	Authenticaton key is in encrypted format.
auth_key	Authentication key. Max 32 characters.
none	Do not use authentication.

Default

None.

Usage Guidelines

Use this command to configure MD5 authentication key for checkpoint connection to MLAG peer.

Example

The following example displays `show mlag peer` output when authentication is not configured:

```
* Switch # show mlag peer
Multi-switch Link Aggregation Peers:

MLAG Peer         : p2
VLAN              : isc                    Virtual Router    : VR-Default
```

```

```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer interval

```
configure mlag peer peer_name interval msec
```

Description

Configures the length of time between health check hello packets.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the peer.
msec	Specifies an MLAG peer health-check hello interval in milliseconds. The range is 50-10000ms. The default is 1000ms.

Default

The interval default is 1000 milliseconds.

Usage Guidelines

Use this command to configure the length of time between health check hello packets exchanged between MLAG peer switches. After three health check hellos are lost, the MLAG peer switch is declared to be failed, triggering an MLAG topology change.

Example

The following command sets an interval of 700 milliseconds on the switch101 peer. switch:

```
# configure mlag peer switch101 interval 700
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer ipaddress

```
configure mlag peer peer_name ipaddress peer_ip_address {vr VR}
```

Description

Associates an peer switch with an MLAG peer structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.
peer_ip_address	Specifies an IPv4 or IPv6 address.
VR	Specifies a virtual router.

Default

N/A.

Usage Guidelines

Use this command to associate an MLAG peer structure with an MLAG peer switch IP address.

The specified IP address must be contained within an existing direct route. If not, the following error message is displayed:

```
ERROR: Specified IP address is not on directly attached subnet in VR.
```

The link connecting MLAG peer switches should use load sharing. If it does not, a output similar to the following is displayed:

```
Note: VLAN v1 will be used as the Inter-Switch Connection to the
MLAG peer mp1. Warning: The VLAN v1 does not have a load share port
configured yet. It is recommended that the Inter-Switch Connection use
load sharing.
```

Example

The following command associates the MLAG peer structure switch101 with the MLAG peer switch IP address 1.1.1.1 on VR-USER:

```
# configure mlag peer switch101 ipaddress 1.1.1.1 vr "VR-USER"
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer lacp-mac

```
configure mlag peer peer_name lacp-mac [auto | lacp_mac_address]
```

Description

Configures LACP MAC on each of the MLAG peer switches. This MAC address will be used as the system identifier in the LACPDUs sent over the MLAG ports.

Syntax Description

mlag	Multi-switch link aggregation used to combine remote ports and local ports to a common logical connection.
peer_name	Alphanumeric string identifying the MLAG peer.
lacp-mac	MAC address to be used as the system identifier in LACPDU for MLAG ports.
auto	System identifier in LACPDU automatically uses switch MAC of MLAG peer with higher IP address for ISC control *VLAN* (default).
lacp_mac_address	MAC address.

Default

Auto.

Usage Guidelines

This command is used to configure the System Identifier used in LACPDU for MLAG ports. The same value has to be configured on both the MLAG peers.

Example

```
# configure mlag peer "peer1" lacp-mac auto
# configure mlag peer "peer1" lacp-mac 00:01:02:03:04:05
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag peer name

configure { **mlag peer** } *peer_name* **name** *new_peer_name*

Description

Renames an established peer.

Syntax Description

mlag	Specifies configuring MLAG settings.
peer	Specifies configuring aspects of the MLAG peer switch.
peer_name	Current MLAG peer name.

name	Specifies renaming the MLAG peer.
new_peer_name	Specifies the new name for the MLAG peer.

Default

N/A.

Usage Guidelines

To view changes made with this command, use the `show mlag peer {peer_name}` command.

Example

The following example changes the MLAG peer name from "mlag1" to "mlag2":

```
# configure mlag peer mlag1 name mlag2
```

```
 # show mlag peer
Multi-switch Link Aggregation Peers:

MLAG Peer          : mlag2
VLAN               :                          Virtual Router    :
Local IP Address   :                          Peer IP Address   :
MLAG ports         : 0                        Tx-Interval       : 1000 ms
Checkpoint Status  : Down                     Peer Tx-Interval  : N/A ms
Rx-Hellos          :                          Tx-Hellos         :
Rx-Checkpoint Msgs:                           Tx-Checkpoint Msgs:
Rx-Hello Errors    :                          Tx-Hello Errors   :
Hello Timeouts     : N/A                      Checkpoint Errors :
Up Time            : N/A                      Peer Conn.Failures: N/A
Local MAC          : 00:04:96:9b:f5:cc        Peer MAC          : None
Config'd LACP MAC  : None                     Current LACP MAC  : 00:04:96:9b:f5:cc
Authentication     : None

Alternate path information: None
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag ports convergence-control

```
configure mlag ports convergence-control [conserve-access-lists | fast]
```

Description

Sets a preference for having a fast convergence time or conserving access lists.

Syntax Description

conserve-access-lists	Specifies that conserving access lists is preferred over low traffic convergence time.
fast	Specifies that low traffic convergence time is preferred at the expense of the number of user access lists.

Default

Conserve-access-lists.

Usage Guidelines

Achieving fast convergence times on local port state changes (down and up), independent of the number of *FDB* entries learned on the MLAG port, requires the use of ACLs. This limits the number of ACLs you have available. This command allows you to set your preference for having either fast convergence time or conserving available access lists for your users.

Note

Configuring fast convergence-control limits the number of ACLs that can be supported by the switch. You must ensure that the system has sufficient user ACLs free when fast mode is selected. Configuring conserve-access-lists convergence-control may increase convergence times on MLAG port failures.

Fast convergence configuration has global significance in that it applies to all MLAG groups that are currently configured and those that may be configured in the future.

Example

The following command specifies a priority of conserving access lists over low traffic convergence time:

```
# configure mlag ports convergence-control conserve-access-lists
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag ports link-up-isolation

```
configure mlag ports link-up-isolation [on | off]
```

Description

Configures linkup isolation, which prevents flood traffic received on newly operational MLAG ports from being forwarded to ISC ports before the ISC blocking filter is installed.

Syntax Description

on	Isolate MLAG ports from sending traffic to local ISC port during link-up transition until remote ISC port is configured.
off	Do not isolate MLAG ports from sending traffic to local ISC port during link-up transition.

Default

The default is off.

Usage Guidelines

Under certain circumstances, a temporary (less than a second) loop condition exists when an MLAG port becomes operational, but before the remote MLAG peer installs the ISC blocking filter. MLAG linkup isolation addresses this condition by preventing any flood traffic (broadcast, unknown, unicast, etc.) received on a just operational MLAG port from being forwarded to ISC ports until the remote MLAG peer installs the ISC blocking filter.

Example

The following example enables MLAG linkup isolation:

```
configure mlag ports link-up-isolation on
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag ports reload-delay

`configure mlag ports` **`reload-delay`** *`reload-delay`*

Description

This command configures a reload delay on Multi-switch Link Aggregation Group (MLAG) ports.

Syntax Description

reload-delay	Specifies creating a reload delay on MLAG ports.
reload-delay	Specifies the MLAG port reload-delay timer in seconds (range = 1–1,200 seconds). The default is 30 seconds.

Default

The default reload-delay timer interval is 30 seconds.

Usage Guidelines

There are cases where MLAG ports comes up quicker than ISC ports after a switch reboot causing traffic loss during this time gap. This command allows you to configure a time delay for MLAG ports providing enough time for ISC ports/neighborship of other Layer 3 protocols to come up. To have this delay timer take effect, you need to issue the enable mlag port reload-delay on page 2211 command.

To stagger the bringing up of MLAG ports, use the command `configure mlag ports` **`reload-interval`** `[`**`none`** `|` *`reload_interval_msec`*`]`

To view the current selection for reload delay, use the `show mlag ports {`*`port_list`*`}` command.

Example

The following example sets the reload-delay to 60 seconds:

```
# configure mlag ports reload-delay 60
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mlag ports reload-interval

`configure mlag ports` **`reload-interval`** `[`**`none`** `|` *`reload_interval_msec`*`]`

Description

Configures a staggered bringing up of ports.

Syntax Description

`reload-interval`	Specifies configuring the time between bringing up individual MLAG ports when reload delay is enabled.
`none`	Specifies not waiting between bringing up individual MLAG ports (default).
`reload_interval_msec`	Specifies the time interval between bringing up MLAG ports in milliseconds. The range is 0–10,000.

Default

By default, this feature is disabled.

Usage Guidelines

MLAG reload delay timer is used to disable MLAG ports during configuration load to allow time for the convergence of protocols and for reachability of MLAG peers (`configure mlag ports` **`reload-delay`** *`reload-delay`*. When there is a large number of MLAG ports (50+), and when all of them are brought up at the same time after the reload delay timer expires, a high convergence time of 1.5 seconds might occur. This command configures a time delay between each of the MLAG ports coming up.

To view the current selection for reload interval, use the `show mlag ports {`*`port_list`*`}` command.

Example

The following example configures reload delay interval of 50 milliseconds:

```
# configure mlag ports reload-interval 50
```

History

This command was first available in ExtremeXOS 22.7.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mld

```
configure mld query_interval query_response_interval
   last_member_query_interval {{vlan} vlan_name} {{vr} vr_name}
   {robustness}
```

Description

Configures the Multicast Listener Discovery (MLD) timers.

Syntax Description

query_interval	Specifies the interval (in seconds) between general queries.
query_response_interval	Specifies the maximum query response time (in seconds).
last_member_query_interval	Specifies the maximum group-specific query response time (in seconds).

vlan_name	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration appliese to all VLANs.
vr_name	Specifies the VR to which the configuration should be applied. If not parameter is specified, the configuration is applied to the current VR context.
robustness	Specifies the degree of robustness for the network.

Default

- query interval—125 seconds
- query response interval—10 seconds
- last member query interval—1 second
- robustness—2

Usage Guidelines

Timers are based on RFC2710. Specify the following:

- query interval—The amount of time, in seconds, the system waits between sending out general queries. The range is 1 to 429,496,729 seconds.
- query response interval—The maximum response time inserted into the periodic general queries. The range is 1 to 25 seconds.
- last member query interval—The maximum response time inserted into a group-specific query sent in response to a leave group message. The range is 1 to 25 seconds.
- robustness—The degree of robustness of the network. The range is 2 to 7.

Example

The following command configures the MLD timers:

```
configure mld 100 5 1 3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping fast-learning

```
configure mld snooping fast-learning [on | off] [vlan vlan_name]
```

Description

Configures fast-learning mode.

Syntax Description

vlan_name	Specifies a vlan name

Default

off.

Usage Guidelines

When MLD snooping is enabled on a *VLAN*, learning of group entries will happen only when the next periodic query is sent by the querier in the network. When fast-learning is turned on using this command, a query is sent under the following conditions:

- When MLD snooping is enabled.
- When MLD snooping VLAN is operationally up.
- Group join limit changed through configuration.

Query generated for faster learning uses unspecified address as the source address (both L2 and L3), unless the switch generating the triggered query is the querier for the network.

Example

```
configure mld snooping fast-learning on
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping filters

```
configure mld snooping filters [per-port | per-vlan]
```

Description

Selects the type of MLD snooping filters that are installed.

Syntax Description

per-port	Installs the per-port MLD snooping filters.
per-vlan	Installs the per-*VLAN* MLD snooping filters.

Default

per-port.

Usage Guidelines

Use the per-vlan option when the number of VLANs configured on the switch is lower than half of the maximum numbers listed in Table 9 on page 584. This option conserves usage of the hardware Layer 3 multicast forwarding table.

When the number of configured VLANs is larger than half of the maximum values listed in Table 9 on page 584, select the per-port option. Each VLAN requires additional interface hardware *ACL* resources. The per-port option conserves usage of the interface hardware ACL resources.

To display the MLD snooping filters configuration, use the show mld snooping command.

Example

The following command configures the switch to install the per-VLAN MLD snooping filters:

```
configure mld snooping filters per-vlan
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping flood-list

```
configure mld snooping flood-list [policy | none]
```

Description

Configures certain multicast addresses to be slow path flooded within the *VLAN*.

Syntax Description

policy	Specifies a policy file with a list of multicast addresses to be handled.
none	Specifies no policy file is to be used.

Default

None.

Usage Guidelines

With this command, you can configure certain multicast addresses to be slow path flooded within the VLAN, instead of fast path forwarded according to MLD and/or Layer 3 multicast protocol.

A policy file is a text file with the extension .pol. It can be created or edited with any text editor. The specified policy file *policy file* should contain a list of addresses that determine if certain multicast streams are to be treated specially. Typically, if the switch receives a stream with a destination address which is in the *policy file* in 'permit' mode, that stream is software flooded and no hardware entry is installed.

When adding an IPv6 address into the policy file, a 128-bit host address is recommended.

This feature is meant to solve the multicast connectivity problem for unknown destination addresses within system reserved ranges. Specifically this feature was introduced to solve the problem of recognizing a certain stream as control packets.

To create a policy file for the snooping flood-list, use the following template:

```
# This is a template for MLD Snooping Flood-list Policy File
# Add your group addresses between "Start" and "End"
# Do not touch rest of file!!!!
entry mldFlood {
if match any {
#------------------ Start of group addresses ------------------
nlri  ff05::100:1/128;
nlri  ff05::100:15/128;
#------------------- end of group addresses -------------------
} then {
permit;
}
}
entry catch_all {
if {
} then {
deny;
}
}
```

Note

The switch does not validate any IP address in the policy file used in this command. Therefore, slow-path flooding should be used only for streams that are very infrequent, such as control packets. It should not be used for multicast data packets. This option overrides any default mechanism of hardware forwarding (with respect to MLD or PIM), so it should be used with caution.

Slow-path flooding occurs within the L2 VLAN only.

Use the **none** option to effectively disable slow path flooding.

You can use the `show mld` command to see the configuration of slow path flooding.

Note
This command has no effect in the current release, as IPv6 multicast traffic floods on all platforms.

Example

The following example configures the multicast data stream specified in access1 for slow-path flooding:

```
configure mld snooping flood-list access1
```

The following command specifies that no policy file is to be used, thus effectively disabling slow-path flooding:

```
configure mld snooping flood-list none
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping leave-timeout

```
configure mld snooping leave-timeout leave_timeout_ms {{vlan} vlan_name}
   {{vr} vr_name}
```

Description

Configures the MLD snooping leave timeout.

Syntax Description

leave_timeout_ms	Specifies an MLD leave timeout value in milliseconds upon receiving an MLD done message.
vlan_name	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.
vr_name	Specifies the VR to which the configuration should be applied. If no parameter is specified, the configuration is applied to the current VR context.

Default

1000 ms.

Usage Guidelines

The range is 0–175000 ms (175 seconds). For timeout values of one second or less, you must set the leave-timeout to a multiple of 100 ms. For values of more than one second, you must set the leave-timeout to a multiple of 1000 ms (one second).

The specified time is the maximum leave timeout value. The switch could leave sooner if an MLD done message is received before the timeout occurs.

Example

The following example configures the MLD snooping leave timeout to 10 seconds:

```
configure mld snooping leave-timeout 10000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping timer

```
configure mld snooping timer router_timeout host_timeout {{vlan}
   vlan_name} {{vr} vr_name}
```

Description

Configures the MLD snooping timers.

Syntax Description

router_timeout	Specifies the time in seconds before removing a router snooping entry.
host_timeout	Specifies the time in seconds before removing a host's group snooping entry.
vlan_name	Applies the configuration only to the specified *VLAN*. If no VLAN is specified, the configuration applies to all VLANs.
vr_name	Specifies the VR to which the configuration should be applied. If no parameter is specified, the configuration is applied to the current VR contex.

Default

The router timeout default setting is 260 seconds. The host timeout setting is 260 seconds.

Usage Guidelines

Timers should be set to approximately 2.5 times the router query interval in use on the network. Specify the following:

- *router_timeout*—The maximum time, in seconds, that a router snooping entry can stay without receiving a router report. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.
- *host_timeout*—The maximum time, in seconds, that a group snooping entry can stay without receiving a group report. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.

MLD snooping is a Layer 2 function of the switch. It does not require multicast routing to be enabled. The feature reduces the flooding of IPv6 multicast traffic. On the VLAN, MLD snooping optimizes the usage of network bandwidth and prevents multicast traffic from being flooded to parts of the network that do not need it. The switch does not reduce any IP multicast traffic in the local multicast domain (FF02::x).

MLD snooping is enabled by default on the switch. MLD snooping expects at least one device on every VLAN to periodically generate MLD query messages. Without an MLD querier, the switch eventually stops forwarding IPv6 multicast packets to any port, because the MLD snooping entries times out, based on the value specified in host timeout.

Example

The following example configures the MLD snooping timers to 600 seconds for both timers:

```
configure mld snooping timer 600 600
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports add dynamic group

```
configure mld snooping {vlan} vlan_name {ports portlist} add dynamic
   group [IPv6_grp_ipaddress]
```

Description

Configures an MLD dynamic group.

Syntax Description

vlan_name	Specifies a *VLAN* name.
portlist	Specifies a port list.
IPv6_grp_ipaddress	Specifies the multicast group IPv6 address.

Default

N/A.

Usage Guidelines

This command adds MLD groups to specific VLANs or to ports belonging to specific VLANs. After the groups are added, the expiration timer is started; this causes the groups to expire. The configuration is not saved in the configuration file. The following message is displayed on execution of this command:

```
INFO: This command is not saved in the configuration.
```

Example

The following example configures a dynamic MLD entry so the multicast group ff02::1:1 is forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 add dynamic group ff02::1:1
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports add static group

```
configure mld snooping {vlan} vlan_name {ports port_list } add static
   group IPv6_grp_ipaddress
```

Description

Configures *VLAN* ports to receive the traffic from a multicast group, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a SummitStack, it can be a list of slots (nodes) and ports. On a standalone switch, it can be one or more port numbers. In the form 1, 2, 3-5, 2:5, 2:6-2:8.
IPv6_grp_ipaddress	Specifies the multicast group IPv6 address.

Default

N/A.

Usage Guidelines

Use this command to forward a particular multicast group to VLAN ports. In effect, this command emulates a host on the port that has joined the multicast group. As long as the port is configured with the static entry, multicast traffic for that multicast group is forwarded to that port.

The switch sends proxy MLD messages in place of those generated by a real host. The proxy messages use the VLAN IPv6 address for source address of the messages. If the VLAN has no IPv6 address assigned, the proxy MLD message uses 0::0 as the source IP address.

Example

The following example configures a static MLD entry so the multicast group ff02::1:1 is forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 add static group ff02::1:1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports add static router

```
configure mld snooping {vlan} vlan_name ports port_list add static
   router
```

Description

Configures *VLAN* ports to forward the traffic from all multicast groups, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a SummitStack, it can be a list of slots and ports. On a standalone switch, it can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

N/A.

Usage Guidelines

Use this command to forward all multicast groups to the specified VLAN ports. In effect, this command emulates a multicast router attached to those ports. As long as the ports are configured with the static entry, all available multicast traffic is forwarded to those ports.

Example

The following example configures a static MLD entry so all multicast groups are forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 add static router
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports delete static group

```
configure mld snooping {vlan} vlan_name ports port_list delete static
   group [all | v6grpipaddress]
```

Description

Removes the configuration that causes *VLAN* ports to receive the traffic from a multicast group, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a modular switch, it can be a list of slots and ports. On a standalone switch, it can be one or more port numbers. In the form 1, 2, 3-5, 2:5, 2:6-2:8.
all	Specifies all multicast groups.
v6grpipaddress	Specifies the multicast group IPv6 address.

Default

N/A.

Usage Guidelines

Use this command to delete a static group from a particular VLAN port.

To add a static group, use the following command:

`configure mld snooping {vlan} vlan_name portsport_list add static groupv6grpipaddress`

Example

The following example removes a static MLD entry so the multicast group ff02::a:b is not forwarded to VLAN marketing on ports 2:1-2:4, unless an MLD join message is received on the port:

```
configure mld snooping marketing ports 2:1-2:4 delete static group ff02::a:b
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports delete static router

`configure mld snooping {vlan} vlan_name ports port_list delete static router`

Description

Configures *VLAN* ports to stop forwarding the traffic from all multicast groups, unless MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a SummitStack, it can be a list of slots and ports. On a standalone switch, it can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

None.

Usage Guidelines

Use this command to remove the configuration that forwards all multicast groups to the specified VLAN ports.

Example

The following example removes a static MLD entry so all multicast groups are not forwarded to VLAN marketing on ports 2:1-2:4, unless an MLD join is received on the port:

```
configure mld snooping marketing ports 2:1-2:4 delete static router
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports filter

```
configure mld snooping vlan vlan_name ports port_list filter [policy]
```

Description

Configures a MLD snooping policy file filter on *VLAN* ports.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a SummitStack, can be a list of slots and ports. On a standalone switch, can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.
policy	Specifies the policy file for the filter.

Default

None.

Usage Guidelines

Use this command to filter multicast groups to the specified VLAN ports.

The policy file used by this command is a text file that contains the IPv6 multicast addresses of the multicast groups that you wish to block.

To remove MLD snooping filtering from a port, use the **none** keyword version of the command.

Use the following template to create a snooping filter policy file:

```
#
# Add your group addresses between "Start" and "end"
# Do not touch the rest of the file!!!!
entry mldFilter {
if match any {
#------------------ Start of group addresses ------------------
nlri FF03::1/128;
nlri FF05::1/112;
#------------------- end of group addresses -------------------
} then {
deny;
}
}
entry catch_all {
if {
} then {
permit;
}
```

Example

The following example configures the policy file ap_multicast to filter multicast packets forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 filter ap_multicast
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mld snooping vlan ports join-limit

```
configure mld snooping {vlan} vlan_name ports port_list join-limit
   [num_joins | no-limit]
```

Description

Configures *VLAN* ports to support a maximum number of MLD joins.

Syntax Description

vlan_name	Specifies a VLAN name
port_list	Specifies one or more ports or slots and ports.
num	Specifies the maximum number of joins permitted on the ports. The range is 1 to 5000.

Default

No limit.

Usage Guidelines

None.

Example

The following example configures port 2:1 in the Default VLAN to support a maximum of 100 MLD joins:

```
configure mld snooping "Default" ports 2:1 join-limit 100
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mld ssm-map add

```
configure mld ssm-map add v6groupnetmask [v6sourceip | src_domain_name]
   { {vr} vr_name }
```

Description

Adds an MLD SSM Mapping entry on a VR.

Syntax Description

v6groupnetmask	You must provide group address with the mask length. Instead of configuring separate entries for a continuous range of IP addresses, this optimizes a range of group IP addresses to be configured as a single entry.
v6sourceip	Specifies the source IP address for which the SSM should apply.
src_domain_name	Provides the option to use DNS to obtain IP addresses dynamically by specifying the domain name.
VR *vr_name*	Specifies the virtual router name.

Default

N/A.

Usage Guidelines

When an MLDv1 report is received for this group or group range, the list of sources configured using this command is used as part of source-specific information to PIM.

The following error message displays when more than 50 source addresses are configured for a specific group:

```
ERROR: Cannot configure more than 50 sources for group ff30::1/128 on VR-Default
```

The following error message displays when a source address is already configured:

```
ERROR: Source 2001:0DB8:1::1 already present for group ff30::1/128 on VR-Default
```

The following error message displays when a DNS name is already configured:

```
ERROR: Only one source domain name allowed for group ff30::1/128 on VR-Default
```

Example

The following example configures a MLD-SSM mapping entry:

```
configure mld ssm-map add ff06::/64 2001::1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mld ssm-map delete

```
configure mld ssm-map delete v6groupnetmask [v6sourceip |
   src_domain_name | all] {{vr} vr_name}
```

Description

Deletes an MLD SSM Mapping entry on a VR.

Syntax Description

v6groupnetmask	You must provide group address with the mask length. Instead of configuring separate entries for a continuous range of IP addresses, this optimizes a range of group IP addresses to be configured as a single entry.
v6sourceip	Specifies the source IP address for which the SSM should apply.
src_domain_name	Provides the option to use DNS to obtain IP addresses dynamically by specifying the domain name.
all	Specifies that all the mapping entries associated with v6groupnetmask are deleted.
vr *vr_name*	Specifies the virtual router name.

Default

N/A.

Usage Guidelines

When an MLDv1 report is received for this group or group range, the list of sources configured using this command is used as part of source-specific information to PIM.

The following error message displays when specified entry is not found:

```
ERROR: SSM Mapping entry (ff30::1/128, 2001:0DB8:1::10) not found on VR-Default
```

Example

The following example deletes a MLD-SSM mapping entry:

```
configure mld ssm-map delete ff06::/64 2001::1
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls add vlan

```
configure mpls add {vlan} vlan_name
```

Description

Adds an *MPLS* interface to the specified *VLAN*.

Syntax Description

vlan_name	Identifies the VLAN where the MPLS interface is added.

Default

VLANs are not configured with an MPLS interface.

Usage Guidelines

An MPLS interface must be configured on a VLAN in order to transmit or receive MPLS packets on that interface. By default, MPLS, LDP, and RSVP-TE are disabled for the MPLS interface. The specified VLAN should have an IP address configured and should have IP forwarding enabled. The MPLS interface on the VLAN does not become active until these two conditions are met. Also, if the IP address is unconfigured from the VLAN or IP forwarding is disabled for the VLAN, the MPLS interface goes down. The MPLS interface state is viewed using the show mpls interface command.

The VLAN must be operational for the MPLS interface to be up. This means that at least one port in the VLAN must be active or the VLAN must be enabled for loopback mode.

It is recommended that when you configure MPLS on an *OSPF* interface that can be used to reach a given destination, you should configure MPLS on all OSPF interfaces that can be used to reach that destination. (You should enable MPLS on all of the VLANs connected to the backbone network).

Example

The following example adds MPLS to the VLAN vlan_usa:

```
configure mpls add vlan vlan_usa
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls delete vlan

```
configure mpls delete [{vlan} vlan_name | vlan all]
```

Description

Removes an *MPLS* interface from the specified *VLAN*.

Syntax Description

vlan_name	Identifies the VLAN for which the MPLS interface is deleted.
vlan all	Deletes the MPLS interface from all VLANS that have MPLS configured.

Default

VLANs are not configured with an MPLS interface.

Usage Guidelines

An MPLS interface must be configured on a VLAN in order to transmit or receive MPLS packets on that interface. If the MPLS interface is deleted, all configuration information associated with the MPLS interface is lost. Issuing this command brings down all LDP neighbor sessions and all LSPs that are established through the specified VLAN interface. When the all VLANs option is selected, the MPLS interface for all MPLS configured VLANs is deleted.

Example

The following example deletes MPLS from the VLAN vlan_k:

```
configure mpls delete vlan vlan_k
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls exp examination

```
configure mpls exp examination {value} value {qosprofile} qosprofile
```

Description

Configures the *QoS* profile that is used for the EXP value when EXP examination is enabled.

Syntax Description

value	Specifies the value that is used for the EXP value.
qosprofile	Specifies the QoS profile that is used for the EXP value.

Default

The QoS profile matches the EXP value + 1.

Usage Guidelines

This command configures the QoS profile that is used for the EXP value when EXP examination is enabled. By default, the QoS profile matches the EXP value + 1. That is, EXP value of 0 is mapped to QoS profile qp1, EXP value of 1 is mapped to QoS profile qp2, etc. This configuration has switch-wide significance. The EXP value must be a valid number from 0 through 7 and the qosprofile must match one of the switch's QoS profiles.

Note

EXP examination must be enabled using the “enable mpls exp examination” command before the configured EXP value to QoS profile mapping is actually used to process packets.

Example

The following command sets QoS profile q5 to be used for EXP value 7:

```
configure mpls exp examination value 7 qosprofile 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls exp replacement

```
configure mpls exp replacement {qosprofile} qosprofile {value} value
```

Description

Configures the EXP value that is used for the specified *QoS* profile when EXP replacement is enabled.

Syntax Description

qosprofile	Specifies the QoS profile that is used for the EXP value.
value	Specifies the value that is used for the EXP value.

Default

The EXP value matches the QoS profile -1.

Usage Guidelines

This command configures the EXP value that is used for the QoS profile when EXP replacement is enabled. By default, the EXP value matches the QoS profile - 1. That is, QoS profile qp1 is mapped to EXP value of 0, QoS profile qp2 is mapped to EXP value of 1, etc. This configuration has switch-wide significance. The qosprofile must match one of the switch's QoS profiles and the EXP value must be a valid number from 0 through 7.

Note

EXP replacement must be enabled using the “enable mpls exp replacement” command before the configured EXP value to QoS profile mapping is actually used to process packets.

Example

The following command sets EXP value 2 to be used with QoS profile 4:

```
configure mpls exp replacement qosprofile qp4 value 2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls labels max-static

```
configure mpls labels max-static max_static_labels
```

Description

Configures the number of labels that are reserved for specifying the incoming label for static LSPs and static pseudowires.

Syntax Description

labels	Specifies that labels are reserved to specify the incoming label for static LSPs and static pseudowires.
max-static	Specifies the number of labels that are reserved to specify the incoming label for static LSPs and static PWs.
max_static-labels	Specifies the value for the maximum number of static labels.

Default

The default static label range size is 100.

Usage Guidelines

Use this command to configure the number of labels that are reserved for specifying the incoming label for static LSPs and static PWs. The static label range generally starts at 16 and the default static label range size is 100. This means that the default static label range is 16 through 115 and can be allocated for either incoming (both transit and egress) static LSPs, or incoming static PWs. The maximum static label_range_size is equal to the incoming label table size – 100 labels for signaling. 960 labels are reserved for L3VPNs. The maximum number of labels available for static configuration is 7116, since at least 100 of those labels are reserved for dynamic signaling.

Since these values vary per-platform, use the `show mpls label usage` command to see details about label usage and platform capability. The minimum static label range size is 0.

Note

MPLS must be disabled when issuing this command. If MPLS is enabled, an error message is displayed and the command has no affect. All other labels, including outgoing labels for static LSPs and PWs and signaled labels used by RSVP-TE and LDP, are allocated out of the dynamic label space.

Example

The following example illustrates how to configure MPLS max-static labels, and how to display them:

```
Summit1.2 # show mpls lab usage

Label Type                  Size    Label Range
--------------------    -------    ----------------------------------------
Supported                1048576    0x00000 - 0xfffff (0 - 1048575)
Reserved                      16    0x00000 - 0x0000f (0 - 15)
Static                       100    0x00010 - 0x00073 (16 - 115)
L3VPN                        960    0x00074 - 0x00433 (116 - 1075)
Dynamic                     7116    0x00434 - 0x01fff (1076 - 8191)
Internal Use                   0    0x00000 - 0x00000 (0 - 0)
...

Summit1.3 # disable mpls
* Summit1.4 # conf mpls lab max-static 7117
Error: There must be at least 100 dynamic labels remaining for MPLS signalling protocols.
* Summit1.5 # conf mpls lab max-static 7116
* Summit1.6 # show mpls lab usage
```

```
Label Type                 Size    Label Range
-------------------    -------    ----------------------------------------
Supported               1048576    0x00000 - 0xfffff (0 - 1048575)
Reserved                     16    0x00000 - 0x0000f (0 - 15)
Static                     7116    0x00010 - 0x01bdb (16 - 7131)
L3VPN                       960    0x01bdc - 0x01f9b (7132 - 8091)
Dynamic                     100    0x01f9c - 0x01fff (8092 - 8191)
Internal Use                  0    0x00000 - 0x00000 (0 - 0)
...
```

History

This command was first available in ExtremeXOS 15.4

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls ldp advertise

```
configure mpls ldp advertise [{direct [all | lsr-id | none]} | {rip [all
   | none] | {static [all | none]}
```

Description

Configures a filter to be used by LDP when originating unsolicited label mapping advertisements to LDP neighbors.

Syntax Description

direct	Specifies that the advertisement filter is applied to the associated FECs with directly-attached routing interfaces.
rip	Specifies that the advertisement filter is applied to FECs associated with *RIP* routes exported by *OSPF*.
static	Specifies that the advertisement filter is applied to FECs associated with static routes.
all	Specifies that unsolicited label mapping advertisements are originated for all routes of the specified type.
lsr-id	Specifies that an unsolicited label advertisement is originated for a direct route that matches the *MPLS* LSR ID.
none	Specifies that no unsolicited label mapping advertisements are originated for the specified route type.

Default

None—the default setting for RIP and static routing methods.

lsr-id—the default setting for direct routes.

Usage Guidelines

You can configure how the advertisement filter is applied, as follows:

- direct—The advertisement filter is applied to the FECs associated with directly-attached routing interfaces.
- rip—The advertisement filter is applied to the FECs associated with RIP routes exported by OSPF.
- static—The advertisement filter is applied to the FECs associated with static routes.

You can configure the advertisement filter, as follows:

- all—Label mappings are originated for all routes of the specified type.
- none—No label mappings are originated for all routes of the specified type. This is the default setting for RIP and static routes.
- lsr-id—A label mapping is originated for a direct route that matches the MPLS LSR ID. This is the default setting for direct routes.

Advertising labels for a large number of routes may increase the required number of labels that must be allocated by LSRs. Take care to ensure that the number of labels advertised by LERs does not overwhelm the label capacity of the LSRs.

Example

The following command configures LDP to originate labels for all local IP interfaces:

```
configure mpls ldp advertise direct all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls ldp loop-detection

```
configure mpls ldp loop-detection [{hop-count hop_count_limit} {path-
   vector path_vector_limit}]
```

Description

Configures the loop-detection parameters used by LDP.

Syntax Description

hop-count	Configures the number of LSRs that the label message can traverse.
hop_count_limit	Specifies the hop count limit. The valid configuration range is from 1 to 255.
path-vector	Configures the maximum number of LSR IDs that can be propagated in the label message.
path_vector_limit	Specifies the path vector limit. The valid configuration range is from 1 to 255.

Default

The default for the hop-count and path-vector limits is 255.

Usage Guidelines

Configuration changes are only applicable to newly created LDP sessions. Disabling and enabling LDP forces all the LDP sessions to be recreated. LDP loop detection must first be enabled for these configuration values to be used.

Example

This command sets the LDP hop count loop detection value to 10. The configured path vector value remains at 255.

```
configure mpls ldp loop-detection hop-count 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls ldp timers

```
configure mpls ldp timers [targeted | link] [{hello-time
   hello_hold_seconds} {keep-alive-time keep_alive_hold_seconds}]
```

Description

Configures LDP peer session timers for the switch.

Syntax Description

targeted	Specifies targeted LDP sessions.
link	Specifies link LDP sessions.
hello_hold_seconds	The amount of time (in seconds) that a hello message received from a neighboring LSR remains valid. The rate at which Hello messages are sent is 1/3 the configured hello-time. If a Hello message is not received from a particular neighboring LSR within the specified *hello_hold_seconds*, then the hello-adjacency is not maintained with that neighboring LSR. The range is 6 to 65,534 seconds.
keep_alive_hold_seconds	The time (in seconds) during which an LDP message must be received for the LDP session with a particular peer LSR to be maintained. If an LDP PDU is not received within the specified session *keep_alive_hold_seconds*, the corresponding LDP session is torn down. The range is 6 to 65,534 seconds.

Default

link *hello_hold_seconds* – 15 seconds

targeted *hello_hold_seconds* – 45 seconds

link *keep_alive_hold_seconds* – 40 seconds

targeted *keep_alive_hold_seconds* – 60 seconds

Usage Guidelines

The LDP peer hello-adjacency timers are separately configurable for link and targeted LDP sessions. The hello timer parameter specifies the amount of time (in seconds) that a Hello message received from a neighboring LSR remains valid. The rate at which Hello messages are sent is 1/3 the configured hello-time. If a Hello message is not received from a particular neighboring LSR within the specified *hello_hold_seconds*, then the hello-adjacency is not maintained with that neighboring LSR.

The session *keep_alive_hold_seconds* parameter specifies the time (in seconds) during which an LDP message must be received for the LDP session to be maintained. The rate at which Keep Alive messages are sent, provided there are no LDP messages transmitted, is 1/6 the configured keep-alive-time. If an LDP PDU is not received within the specified session *keep_alive_hold_seconds* interval, the corresponding LDP session is torn down. The minimum and maximum values for hold timers are 6 and 65,534, respectively.

Changes to targeted timers only affect newly created targeted sessions. Disabling and then enabling VPLS or LDP causes all current targeted sessions to be re-created. The default values for the various times are as follows: link *hello_hold_seconds* (15), link *keep_alive_hold_seconds* (40), targeted *hello_hold_seconds* (45), and targeted *keep_alive_hold_seconds* (60). Changes to the link keep-alive timers do not take effect until the LDP session is cycled.

Example

The following command configures link-level LDP hello adjacency hold time to 30 seconds and the keep alive time to 10 seconds:

```
configure mpls ldp timers link hello-time 30 keep-alive-time 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls lsr-id

```
configure mpls lsr-id ipaddress
```

Description

Configures the *MPLS* LSR ID for the switch.

Syntax Description

ipaddress	Specifies an IP address to identify the MPLS LSR for the switch. The MPLS LSR-ID should be configured to the same IP address as the *OSPF* Router ID.

Default

No LSR ID is configured by default.

Usage Guidelines

LDP, RSVP-TE, and L2 VPNs all use the LSR ID. It is normally set to the OSPF Router ID.

The LSR ID must be configured before MPLS can be enabled. The LSR ID cannot be changed while MPLS is enabled. It is highly recommended that an IP address be configured on a OSPF enabled loopback *VLAN* that matches the configured LSR ID and OSPF ID. If an LSR ID loopback IP address is configured, OSPF automatically advertises the LSR ID as a routable destination for setting up LSPs. The LSR ID remains active if an interface goes down if the LSR-ID is configured as an IP address on a loopback VLAN, as recommended. This significantly enhances network stability and operation of an MPLS network.

Example

The following command configures the LSR ID to 192.168.50.5:

```
configure mpls lsr-id 192.168.50.5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te bandwidth committed-rate

```
configure mpls rsvp-te bandwidth committed-rate committed_bps [Kbps |
   Mbps | Gbps] [{vlan} vlan_name | vlan all] {receive | transmit |
   both}
```

Description

Specifies the maximum amount of Committed Information Rate (CIR) bandwidth which can be used by RSVP-TE LSP reservations.

Syntax Description

committed_bps	Specifies a bitrate for the bandwidth to be reserved.
Kbps	Specifies the designated bitrate in kilobits per second.
Mbps	Specifies the designated bitrate in megabits per second.
Gbps	Specifies the designated bitrate in gigabits per second.
vlan	Specifies that the bandwidth is to be reserved for a specific *VLAN*.
vlan_name	Identifies the VLAN for which the bandwidth is reserved.
vlan all	Specifies that the bandwidth is reserved for all VLANS that have *MPLS* configured.
receive	Specifies that the bandwidth is reserved for ingress traffic only.
transmit	Specifies that the bandwidth is reserved for egress traffic only.
both	Specifies that the bandwidth is reserved for both ingress and egress traffic.

Default

The default is zero, which means no RSVP-TE LSP bandwidth reservations are accepted.

If bandwidth is specified without specifying traffic direction, the default is both directions.

Usage Guidelines

This command specifies the maximum amount of Committed Information Rate (CIR) bandwidth which can be used by dynamic RSVP-TE LSP bandwidth reservations. By sub-allocating reserveable bandwidth for RSVP-TE from the VLAN's available bandwidth, the switch can guarantee that as LSPs are established, a minimum amount of CIR bandwidth is available for other traffic.

Note

Beginning with ExtremeXOS Release 12.2.1, CIR bandwidth for the receive direction is not tracked by TE IGPs, such as *OSPF*-TE, and configuring it is not required. Configuring CIR bandwidth for the receive direction does not prevent an LSP from going operational due to lack of receive bandwidth; however, it can be useful for tracking and informational purposes. An Info level log (MPLS.RSVPTE.IfRxBwdthExcd) is generated if the setup of a TE LSP requires receive bandwidth greater than that which is currently available for the receive direction on a particular interface. This generally happens only when TE LSPs with different previous hops ingress the switch on the same interface (for example, from a multi-access link) and egress the switch on different interfaces.

The keyword **both** configures the reserved bandwidth for both ingress and egress LSP CIR reservations and overwrites any previous receive or transmit settings.

Example

The following command reserves 25 Mbps of CIR bandwidth for all RSVP-TE CIR reservations on the specified VLAN:

```
configure mpls rsvp-te bandwidth committed-rate 25 Mbps vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp add path

```
configure mpls rsvp-te lsp lsp_name add path [path_name | any] {profile
   profile_name} {primary {frr_profile_name} | secondary}
```

Description

Adds a configured path to the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the name of the LSP you are configuring.
path_name	Specifies the name of the path to be used by the specified LSP.
any	Configures the specified LSP to use any path.
profile_name	Specifies a profile to be applied to the specified LSP. If the profile name is omitted, the profile named default is used.
primary	Designates the specified path as the primary path. Only one primary path can be configured for an RSVP-TE LSP. If this option is omitted and no primary path has been specified, the specified path is added as a primary path. If not specified and a primary path has already been added, the path is added as a secondary path.
secondary	Designates the specified path as a secondary path.
frr_profile_name	Specifies a fast reroute (FRR) profile to be applied to the detour LSP that backs up the specified LSP.

Default

N/A.

Usage Guidelines

The LSP is not signaled until a path is added to the LSP.

If you want fast reroute protection for the LSP, use the primary option and specify the fast reroute profile name you want to use. To specify the default fast reroute profile, enter default-frr.

The switch chooses the local *MPLS VLAN* interface from which to signal the LSP. To force an LSP to use a specific local MPLS interface, configure the local interface IP address as the first ERO in the associated path.

Example

This command adds the path sydney-bypass to the LSP named aus as a secondary path:

```
configure mpls rsvp-te lsp aus add path sydney-bypass secondary
```

History

This command was first available in ExtremeXOS 11.6.

The fast reroute capability was added in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp change

```
configure mpls rsvp-te lsp lsp_name change [path_name | any] use profile
   [{standard_profile_name} {frr_profile_name}]
```

Description

Changes the configuration that has been configured with the `configure mpls rsvp-te lsp lsp_name add path [path_name | any] {profileprofile_name} {primary {frr_profile_name} | secondary}` command.

Syntax Description

lsp_name	Specifies the name of the LSP you are changing.
path_name	Specifies the name of the path to be used by the specified LSP.
any	Configures the specified LSP to use any path.
standard_profile_ name	Specifies a profile to be applied to the specified LSP. If the profile name is omitted, the profile named default is used.
frr_profile_ name	Specifies a fast reroute (FRR) profile to be applied to the detour LSP that backs up the specified LSP.

Default

N/A.

Usage Guidelines

None.

Example

This command changes the LSP named aus to use any available path:

```
configure mpls rsvp-te lsp aus change any
```

History

This command was first available in ExtremeXOS 11.6.

The fast reroute capability was added in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described iin the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp delete path

```
configure mpls rsvp-te lsp lsp_name delete path [path_name | any | all]
```

Description

Deletes a path from the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies a name for the RSVP-TE LSP.
path_name	Specifies a name for the path to be deleted from the RSVP-TE LSP.
any	Configures the specified LSP to use any path.
all	Deletes all added paths from the specified RSVP-TE LSP.

Default

N/A.

Usage Guidelines

This command deletes a path from the specified RSVP-TE LSP. All the added paths can be deleted by specifying the all keyword. If the active path is deleted, then one of the other configured paths becomes the active path for the LSP. If there are no other defined paths, then the LSP is marked down and cannot be used to forward IP or VPN traffic.

Example

The following command deletes the path called through-knightsbridge for the LSP london:

```
configure mpls rsvp-te lsp london delete path through-knightsbridge
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp fast-reroute

```
configure mpls rsvp-te lsp lsp_name fast-reroute [enable | disable]
```

Description

Enables or disables fast-reroute protection for the specified LSP.

Syntax Description

lsp_name	Specifies the name of the LSP you are configuring.

Default

Disabled.

Usage Guidelines

To signal the fast-reroute protected LSP, use the `enable mpls rsvp-te lsp [lsp_name | all]` command. Similarly, to disable the fast-reroute protected LSP, use the `disable mpls rsvp-te lsp [lsp_name | all]` command.

Example

This command enables fast-reroute protection on LSP aus:

```
configure mpls rsvp-te lsp aus fast-reroute enable
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp path use profile

```
configure mpls rsvp-te lsp lsp_name path [path_name | any] use profile
   profile_name
```

Description

Changes the profile that the configured LSP path uses.

Syntax Description

lsp_name	Specifies the RSVP-TE LSP.
path_name	Specifies the configured RSVP-TE LSP path.
profile_name	Specifies a profile to be applied to the configured LSP path.

Default

N/A.

Usage Guidelines

This command changes the profile that the configured LSP path uses.

Note
Changing the profile while an LSP is active may cause the LSP to be torn down and re-signaled.

Example

The following command configures the switch to apply the LSP profile gold-class to the LSP path sydney-bypass for the LSP aus:

```
configure mpls rsvp-te lsp aus path sydney-bypass use profile gold-class
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te lsp transport

```
configure mpls rsvp-te lsp lsp_name transport [ip-traffic [allow | deny]
   | vpn-traffic [allow {all | assigned-only} | deny]]
```

Description

Configures the type of traffic that may be transported across a named LSP.

Syntax Description

lsp_name	Specifies the RSVP-TE LSP.
ip-traffic	Controls the forwarding of routed IP traffic across the specified LSP.
vpn-traffic	Controls the forwarding of VPN traffic over the LSP.
allow	Allows transport of the specified traffic across the LSP.
deny	Denies transport of the specified traffic across the LSP.
allow	Allows all VPLS VPN traffic to be transported across the LSP.
all	Allows the transmission of all VPN traffic over the LSP.
assigned-only	Limits the transport of VPN traffic to VPLS instances that are explicitly configured to use the specified LSP name.

Default

The default behavior is to allow RSVP-TE LSPs to transport all types of traffic without restriction.

Usage Guidelines

This command configures the type of traffic that may be transported across a named LSP. By default, both IP traffic and VPN traffic are set to allow transport for a newly created LSP. The ip-traffic keyword is used to allow or deny forwarding of routed IP traffic across the specified LSP. If allowed, the LSP label information is inserted into the routing table and the switch forwards traffic over the LSP that matches the IP route entry to which this LSP is associated. If denied, the LSP label information is removed from the routing table and the switch does not use the LSP to transport IP traffic. The vpn-traffic keyword controls the transmission of VPN traffic over the LSP. When denied, the LSP is not used as a transport for PWs or other VPN related traffic. These transport configuration options are independent. For example, if vpn-traffic is set to allow and ip-traffic is set to deny, then no routed IP traffic is transported across the LSP, but the LSP may still be used to transport VPN traffic.

The optional assigned-only keyword limits the transport of VPN traffic to only those VPLS instances that are explicitly configured to use the specified LSP name.

Example

The following command prevents the switch from using LSP aus to forward IP traffic:

```
configure mpls rsvp-te lsp aus transport ip-traffic deny
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te metric

```
configure mpls rsvp-te metric [value | use-igp] {vlan} vlan_name
```

Description

Configures the TE metric value for the RSVP-TE interface specified by the *vlan_name* argument.

Syntax Description

value	Specifies a value for the RSVP-TE metric.
vlan	Specifies that the RSVP-TE metric is configured for a specific *VLAN*.
vlan_name	Identifies the VLAN for which the RSVP-TE metric is configured.

Default

The associated default IGP metric.

Usage Guidelines

The TE metric can be any unsigned non-zero 32-bit integer. The default value for the RSVP-TE interface is to use the associated default IGP metric. The TE metric is exchanged between *OSPF* routers and is used in the calculation of the CSPF topology graph.

Example

The following command configures an RSVP-TE metric of 220 on the specified VLAN:

```
configure mpls rsvp-te metric 220 vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te path add ero

```
configure mpls rsvp-te path path_name add ero [ { include }ipNetmask
   [strict|loose] | exclude ipNetmask] {order number}
```

Description

The routed path for an RSVP-TE LSP can be described by a configured sequence of the LSRs and/or subnets traversed by the path. Each defined LSR or subnet represents an ERO subobject. Up to 64 subobjects can be added to each path name. LSRs and/or subnets can be either included or excluded.

Syntax Description

path_name	Specifies the path to which the IP address is added.
include	Specifies an LSR or subnet to be included in the path calculation.
ipNetmask	Specifies an IP prefix.
strict	Specifies that the subobject must be topologically adjacent to the previous subobject in the ERO list.
loose	Specifies that the subobject need not be topologically adjacent to the previous subobject in the ERO list.
exclude	Specifies a subnet to be excluded in the path calculation.
number	Specifies the LSR path order.

Default

The order value defaults to 100 if the path has no EROs configured or a value 100 more than the highest order number configured for the path.

Usage Guidelines

This command adds an IP address to the Explicit Route Object (ERO) for the specified path name. The RSVP-TE routed path may be described by a configured sequence of the LSRs and/or subnets that the path traverses. Each defined LSR or subnet represents an ERO subobject. Up to 64 subobjects can be added to each path name. The ERO keyword identifies an LSR using an IP prefix, which may represent an LSR's Router ID, loopback address, or direct router interface. Each IP prefix is included in the ERO as an IPv4 subobject.

If the ERO is specified as strict, the strict subobject must be topologically adjacent to the previous subobject as listed in the ERO. If the ERO is specified as loose, the loose subobject is not required to be topologically adjacent to the previous subobject as listed in the ERO. If the specified IP prefix matches the OSPF router ID or a configured loopback IP address, the ERO must be configured as loose.

The LSR path order is optionally specified using the order keyword. The order number parameter is an integer value from 1 to 65535. IP prefixes with a lower number are sequenced before IP prefixes with a higher number. Thus, the LSP path follows the configured path of IP prefixes with a number value from low to high. If the order keyword is not specified, the number value for the LSR defaults to a value equal to the current highest number value plus 100. If the list of IP prefixes added to the path does not reflect an actual path through the network topology, the path message is returned with an error from a downstream LSR and the LSP is not established.

[1] "Topologically adjacent" indicates that the router next hop matches either the interface IP address or *OSPF* router ID of an immediate peer LSR.

The order of a configured subobject cannot be changed. The ERO subobject must be deleted and re-added with a different order. If a subobject is added to or deleted from the ERO while the associated LSP is established, the path is torn down and is re-signaled using the new ERO. Duplicate ERO subobjects are not allowed.

Defining an ERO for the path is optional. If no ERO is configured, the path is signaled along the best available path and the ERO is not included in the path message. When the last subobject in the ERO of the path message is reached and the egress IP node of the path has not been reached, the remaining path to the egress node is signaled along the best available path. If the next subobject in the ERO is loose, the best available path to the next subobject is chosen. Configuring EROs could lead an LSP to take an undesirable path through the network, so care should be taken when specifying EROs.

Example

The following example adds the IP interface address 197.57.30.7/24 as a loose ERO to the path sydney-bypass:

```
configure mpls rsvp-te path sydney-bypass add ero 197.57.30.7/24 loose
```

History

This command was first available in ExtremeXOS 11.6.

The **include** and **exclude** options were added in ExtremeXOS 15.7. "Include" was the previous default behavior.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te path delete ero

```
configure mpls rsvp-te path path_name delete ero [all | ipNetmask |
   order number]
```

Description

Deletes a subobject from the Explicit Route Object (ERO) for the specified path name.

Syntax Description

path_name	Specifies the path from which the ERO is deleted.
all	Specifies that the entire ERO should be deleted from the named path.
ipNetmask	Specifies the ERO subobject to be deleted.
number	Specifies the order number of the ERO subobject to be deleted.

Default

N/A.

Usage Guidelines

This command deletes a subobject from the Explicit Route Object (ERO) for the specified path name. The ERO subobject is specified using an IP prefix or order number. If a subobject is deleted from an ERO while the associated LSP is established, the path is torn down and is re-signaled using a new ERO. The all keyword may be used to delete the entire ERO from the path name. When there is no configured ERO, the path is no longer required to take an explicit routed path. The path is then signaled along the best available path and no ERO is included in the path message.

Example

The following command deletes all the configured EROs from the path sydney-bypass:

```
configure mpls rsvp-te path sydney-bypass delete ero all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te profile (fast-reroute)

```
configure mpls rsvp-te profile frr_profile_name {bandwidth
   bandwidth_rate_bps bandwidth_rate_unit} {detour {hop-limit
   hop_limit_value} {bandwidth-protection [enabled | disabled]} {node-
   protection [enabled | disabled]}} {hold-priority hold_priority_value}
   {setup-priority setup_priority_value}
```

Description

Configures the specified RSVP-TE FRR profile.

Syntax Description

frr_profile_name	Specifies the FRR LSP profile to configure.
bandwidth_rate_bps	Specifies the bandwidth requirement for the FRR LSP. This should be set to match the options chosen for the protected LSP. Otherwise, a mismatch between the bandwidth settings for the detour and protected LSPs can impact service.

bandwidth_rate_unit	Specifies the units for the bandwidth rate. Valid entries are Kbps, Mbps, and Gbps.
detour	Specifies the detour method of fast reroute. This is the only method supported in this release.
hop_limit_value	Specifies the maximum number of hops that the detour path is allowed to take from the current node or point of local repair (PLR) to a merge point (MP) node. If set to 0, only link protection is provided.
bandwidth-protection	When enabled, this option specifies that the signaled bandwidth on the detour path must be guaranteed. If this option is disabled, the detour path might not support the bandwidth needed for the protected LSP.
node-protection	When enabled, the this option indicates to the PLRs along a protected path that a detour path that bypasses at least the next node of the protected LSP is desired. If this option is disabled, the backup path might or might not bypass the next node, in which case the user might or might not have next-node protection.
hold-priority	Specifies the hold priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7. Hold priority is used when deciding whether a session can be preempted by another session. This works exactly the same as the hold-priority set in the standard profile that is valid for the protected LSP and for standard LSPs.
setup-priority	Specifies the setup priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7. The setup priority is used when deciding whether the detour LSP can preempt another session. This works exactly the same as the setup-priority set in the standard profile that is valid for the protected LSP and standard LSPs.

Default

Bandwidth: Newly-created profiles are configured as best-effort. Setup-priority: 7 (lowest) Hold-priority: 0 (highest) Hop-limit: 3 Protect-bandwidth: enabled Protect-node: enabled

Usage Guidelines

A FRR profile is a set of attributes that are applied to the detour and protected LSPs when a protected LSP is configured. A default profile (frr-default) is provided which cannot be deleted, but can be applied to any protected LSP. The maximum number of configurable profiles is 1000.

Note

Changing any of the profile parameters causes LSPs using the profile to be torn down and re-signaled. There is no guarantee that the re-signaled LSP will be successfully established. Future ExtremeXOS implementations may support the make-before-break LSP concept.

Example

The following command configures the FRR profile frrprofile for 100 Mbps bandwidth:

```
configure mpls rsvp-te profile frrprofile bandwidth 100 Mbps
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te profile

```
configure mpls rsvp-te profile profile_name {bandwidth [best-effort |
   [{committed-rate committed_bps [Kbps | Mbps | Gbps]} {max-burst-size
   burst_size [Kb | Mb]} {peak-rate peak_bps [Kbps | Mbps | Gbps]}]}
   {hold-priority hold_priority} {mtu [number | use-local-interface]}
   {path-computation [full | partial]} {record [enabled {route-only} |
   disabled]} {setup-priority setup_priority}
```

Description

Configures an RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Specifies the LSP profile.
bandwidth	Specifies bandwidth reservation.
best-effort	Indicates no bandwidth reservation.
committed_bps	Specifies the committed bandwidth to be reserved across the *MPLS* network, in bits per second. The range is from 64 Kbps to 10 Gbps.
peak_bps	Specifies the maximum bandwidth signaled in bits per second. The range is from 64 Kbps to 10 Gbps.
Kbps	Specifies the designated bitrate in kilobits per second.
Mbps	Specifies the designated bitrate in megabits per second.
Gbps	Specifies the designated bitrate in gigabits per second.
burst_size	Specifies the maximum number of bytes (specified in bits) that the LSP is allowed to burst above the specified peak-rate. The range is from 0 to 1000 Mb.
Kb	Kilobits
Mb	Megabits
hold_priority	Specifies the priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7.
setup_priority	Specifies the priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7.
number	Specifies the MTU value for the LSP. The range is from 296 to 9216/

use-local-interface	Specifies that the MTU value is inherited from the local egress *VLAN* interface.
record	Configures hop-by-hop path recording.
enabled route-only	Causes the Record Route Object (RRO) to be inserted into the path message. The enabled option enables recording of hops and labels. The enabled route-only option records only hops.
disabled	Specifies that no RRO is inserted into the path message.
path-computation	Computation strategy for calculating a path to the LSP destination: • **full** = Requires the ingress node to fully calculate a path to the LSP destination (default). • **partial** = Allows the ingress node to calculate only part of the path to the LSP destination.
full	Allows the entire LSP path to be specified at ingress LSR (no calculations performed by any transit nodes).
partial	Allows you to specify 'part' of the path at ingress LSR. (For *OSPF* usage, specify LSP path to the ABR, then ABR provides the calculation into the other areas.)

Default

Bandwidth: Newly-created profiles are configured as best-effort.

Setup-priority: 7 (lowest).

Hold-priority: 0 (highest).

Path recording: disabled.

MTU: use-local-interface.

Path-computation: full.

Usage Guidelines

A profile is a set of attributes that are applied to the LSP when the LSP is configured using the configure mpls rsvp-te lsp command. A default profile is provided which cannot be deleted, but may be applied to any TE LSP. The *profile_name* for the default profile is default. The default profile parameter values are initially set to their respective default values. The maximum number of configurable profiles is 1000.

LSPs may signal reserved bandwidth. By default, newly created profiles are configured to not signal bandwidth requirements and thus are classified as best-effort. If bandwidth needs to be reserved across the MPLS network, the bandwidth parameters specify the desired reserved bandwidth for the LSP. The committed-rate specifies the mean bandwidth and the peak-rate specifies the maximum bandwidth signaled. The peak-rate must be equal to or greater than the committed-rate. If the peak-rate is not specified, traffic is not clipped above the committed-rate setting. The rates are specified in bps and must be qualified by Kbps, Mbps, or Gbps. The minimum and maximum bandwidth rates are 64 Kbps and 10 Gbps, respectively. The max-burst-size specifies the maximum number of bytes (specified in bits) that the LSP is allowed to burst above the specified peak-rate. The minimum burst size is 0 and the maximum burst size is 1000 Mb.

The setup-priority and hold-priority are optional parameters indicating the LSP priority. During path set up, if the requested bandwidth cannot be reserved through the LSR, the setup-priority parameter is compared to the hold-priority of existing LSPs to determine if any of the existing LSPs need to be preempted to allow a higher priority LSP to be established. Lower numerical values represent higher priorities. The setup-priority range is 0 to 7 and the default value is 7 (lowest). The hold-priority range is also 0 to 7 and the default value is 0 (highest). If bandwidth is requested for the LSP, the CSPF calculation uses the available bandwidth associated with the *CoS* as specified by the hold-priority.

The bandwidth, hold-priority, and setup-priority values are signaled in the path message. If the bandwidth setting is changed, all LSPs using this profile are re-signaled. If the bps setting is decreased, a new path message is sent along the LSP indicating the new reservation. If the bps setting is increased, the LSP is torn down and resignaled using the new bandwidth reservations.

The record command is used to enable hop-by-hop path recording. The enabled keyword causes the Record Route Object (RRO) to be inserted into the path message. The RRO is returned in the RESV Message and contains a list of IPv4 subobjects that describe the RSVP-TE path. Path recording by default is disabled. When disabled, no RRO is inserted into the path message.

The mtu keyword optionally specifies the MTU value for the LSP. By default, this value is set to use-local-interface. In the default configuration, the MTU value is inherited from the local egress VLAN interface. The minimum MTU value is 296 and the maximum value is 9216. Path MTU information is carried in the Integrated Services or Null Service RSVP objects and is used by RSVP to perform path MTU identification.

Note

Changing any of the profile parameters causes LSPs using the profile to be torn down and re-signaled. There is no guarantee that the re-signaled LSP will be successfully established. Future ExtremeXOS implementations may support the make-before-break LSP concept.

To view a profile configuration, enter the following command:

```
show mpls rsvp-te profile {profile_name} {detail}
```

To view LSP recorded route information, enter one of the following commands:

```
show mpls rsvp-te lsp [ingress {fast-reroute} | ingress_lsp_name
| ingressingress_lsp_name | ingress [destination | origin]ipaddress]
{[all-paths | detail] | summary | down-paths {detail}} show mpls rsvp-
te lsp [egress | transit] {fast-reroute} {{lsp_name} {[destination |
origin]ipaddress} {detail} | summary}
```

Example

The following command configures the RSVP-TE profile gold-class with a committed bandwidth of 100 Mbps and the setup and hold priorities are both set to 0 (highest priority):

```
configure mpls rsvp-te profile gold-class bandwidth committed-rate 100 mbps hold-priority
0 setup-priority 0
```

History

This command was first available in ExtremeXOS 11.6.

The **path-computation** option added in ExtremeXOS 21.1

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te timers lsp rapid-retry

```
configure mpls rsvp-te timers lsp rapid-retry {decay-rate percent}
   {delay-interval milliseconds} {retry-limit [number]}
```

Description

Configures the timers associated with rapidly retrying failed LSPs.

Syntax Description

percent	Specifies a percent increase in the interval allowed before each subsequent attempt to re-signal an LSP. The valid range is from 0 to 100 percent.
milliseconds	Specifies the time (in milliseconds) to wait before attempting to re-signal the LSP.
retry-limit	Specifies the maximum allowed attempts to establish an LSP.
number	Specifies a maximum number of allowed attempts to establish an LSP. The valid number range is from zero to 255.

Default

Delay interval: 500 milliseconds.

Decay rate: 50%.

Retry limit: 10.

Usage Guidelines

This command configures the timers associated with rapidly retrying failed LSPs. If an LSP fails to establish, the switch attempts to rapidly retry the setup by sending additional path messages based on the rapid-retry timers. The delay-interval timer specifies the time (in milliseconds) to wait before sending another path message. If the LSP fails to establish itself on subsequent attempts, the delay-interval time is incremented based on the decay-rate setting. The decay operation multiplies the delay-interval time by the decay rate, and adds the result to the current delay-interval time.

For example, if the decay-rate is set to 50 percent and the current delay-interval time is 500 milliseconds, a path message is retransmitted in 750 milliseconds. If the LSP fails to establish on the next attempt, a path message is retransmitted after a further decayed delay interval of 1125 milliseconds (1.125 seconds). A per-LSP delay-interval time is maintained for each LSP until the LSP is established. This process of decaying the retry time continues until the LSP is established or the retry-limit expires. If the retry-limit is reached, attempts to rapidly retry the LSP are suspended.

When the switch starts the process of re-signaling the LSP based on the standard-retry timers, the LSP's rapid-retry timers return to the initial configuration settings. If the standard-retry delay-interval time is reached before all of the rapid-retry attempts have completed, the standard-retry mechanisms take over.

The default rapid-retry LSP timer parameter values are 500 milliseconds for the delay-interval, 50 percent for the decay-rate, and a retry-limit of 10. The valid range for delay-interval is 10 to 1000 milliseconds. The valid decay-rate range is 0 to 100 percent. The valid retry-limit is 0 to 100. A value of 0 indicates that the LSP is not re-signaled using the rapid-retry timers.

When summary-refresh or bundle-message is enabled, the rapid-retry timer values are used for resending any message that is not acknowledged.

Example

The following command sets the maximum number of rapid retries to five:

```
configure mpls rsvp-te timers lsp rapid-retry retry-limit 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te timers lsp standard-retry

```
configure mpls rsvp-te timers lsp standard-retry {decay-rate percent}
   {delay-interval seconds} {retry-limit [number | unlimited]}
```

Description

Configures the timers associated with the establishment of an LSP.

Syntax Description

percent	Specifies a percent increase in the interval allowed before each subsequent attempt to re-signal an LSP. The valid range is from 0 to 100 percent.
seconds	Specifies the time (in seconds) to wait before attempting to re-signal the LSP.
retry-limit	Specifies the maximum allowed attempts to establish an LSP.

number	Specifies a maximum number of allowed attempts to establish an LSP. The valid number range is from zero to 255.
unlimited	Allows unlimited attempts to establish an LSP.

Default

Delay interval: 30 seconds.

Decay rate: 0%.

Retry limit: unlimited.

Usage Guidelines

This command configures the timers associated with the establishment of an LSP. If an LSP fails to establish, the LSP is re-signaled based on the configuration of these timers. The delay-interval timer specifies the time (in seconds) to wait before attempting to re-signal the LSP. If the LSP fails to establish itself on subsequent attempts, the delay-interval time is incremented based on the decay-rate setting. The decay operation multiplies the delay-interval time by the decay rate, and adds the result to the current delay-interval time. For example, if the decay-rate is set to 50 percent and the current delay-interval time is 30 seconds, the LSP is re-signaled in 45 seconds. If the LSP failed to establish on the next attempt, the delay interval would be further decayed to 67 seconds.

A per-LSP delay-interval time is maintained for each LSP until the LSP is established. This operation of decaying the retry time continues until the LSP is established or the retry-limit expires. If the retry-limit is reached, attempts to establish the LSP are suspended.

Disabling and enabling the LSP resets the LSP's delay-interval time and retry-limit to the initial configuration settings and LSP establishment attempts resume. The default LSP timer parameter values are 30 seconds for delay-interval, with a 0 percent decay-rate, and retry-limit of unlimited. The valid range for delay-interval is 1 to 60 seconds. The valid decay-rate range is 0 to 100 percent. The valid retry-limit is 0 to 255 or unlimited. A value of 0 indicates that the LSP is not re-signaled.

Example

The following command allows unlimited retries for establishing MPLS RSVP-TE LSPs:

```
configure mpls rsvp-te timers lsp standard-retry retry-limit unlimited
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls rsvp-te timers session

```
configure mpls rsvp-te timers session[{bundle-message-
   time bundle_message_milliseconds} {hello-keep-multiplier
   hello_keep_number} {hello-time hello_interval_seconds}{refresh-keep-
   multiplier refresh_keep_number} {refresh-time refresh_seconds}
   {summary-refresh-time summary_refresh_milliseconds}] [{vlan}
   vlan_name | vlan all]
```

Description

Configures the RSVP-TE protocol parameters for the specified *VLAN*.

Syntax Description

bundle_message_milliseconds	Specifies the maximum time a transmit buffer is held to allow multiple RSVP messages to be bundled into a single PDU. The valid range is from 50 to 3000 milliseconds.
hello_keep_number	Specifies the number of hello-time intervals that can elapse before an RSVP-TE peer is declared unreachable. The range is from one to 255.
hello_interval_seconds	Specifies the RSVP Hello packet transmission interval. The valid range is from 1 to 60 seconds.
refresh_keep_number	Specifies a factor to be used in calculating the maximum allowed interval without an RSVP refresh message before an RSVP session is torn down. The range is from one to 255.
refresh_seconds	Specifies the interval for sending refresh path messages. The range is from 1 to 600 seconds.
summary_refresh_milliseconds	Specifies the interval for sending summary refresh messages. The valid range is from 50 (1/20 second) to 10000 (10 seconds).
vlan	Specifies that the configured protocol parameters are for a specific VLAN.
vlan_name	Identifies a particular VLAN for which the protocol parameters are configured.
vlan all	indicates that the protocol configuration parameters apply to all RSVP-TE enabled VLANs.

Default

Bundle-message-time: 1000 milliseconds (1 second).

Hello-keep-multiplier value: 3.

Hello-time: 3 seconds.

Refresh-keep-multiplier value: 3.

Refresh-time: 30 seconds.

Summary-refresh-time: 3000 milliseconds (3 seconds).

Usage Guidelines

This command configures the RSVP-TE protocol parameters for the specified VLAN. The VLAN keyword all indicates that the configuration changes apply to all VLANs that have been added to *MPLS*.

The hello-time value specifies the RSVP hello packet transmission interval. The RSVP hello packet enables the switch to detect when an RSVP-TE peer is no longer reachable. If an RSVP hello packet is not received from a peer within the configured interval, the peer is declared down and all RSVP sessions to and from that peer are torn down. The formula for calculating the maximum allowed interval is: [hello-time * hello-keep-multiplier]. The default hello-interval time is 3 seconds with a valid range from 1 to 60 seconds. The default hello-keep-multiplier value is three with a range from one to 255.

The refresh-time specifies the interval for sending refresh path messages. RSVP refresh messages provide “soft state” link-level keep-alive information for previously established paths and enable the switch to detect when an LSP is no longer active. Path messages are used to refresh the LSP if summary refresh is disabled. If summary refresh is enabled, summary refresh messages are sent in place of sending individual path messages for every LSP. The default refresh-time is 30 seconds. The minimum and maximum refresh-time values are one and 600 (or 10 minutes) respectively.

If summary refresh is enabled, summary refresh messages are sent at intervals represented by the configured summary-refresh-time. The configurable summary-refresh-time range is 50 milliseconds (one twentieth of a second) to 10000 milliseconds (10 seconds). The default setting for summary-refresh-time is 3000 milliseconds (3 seconds). RSVP sessions are torn down if an RSVP refresh message is not received from a peer within the configured interval. The formula for calculating the maximum allowed interval is: [(refresh-keep-multiplier + 0.5) * 1.5 * (refresh-time or summary-refresh-time)]. The default refresh-keep-multiplier value is three. The minimum and maximum refresh-keep-multiplier values are one and 255 respectively.

The bundle-message-time, specified in milliseconds, indicates the maximum time a transmit buffer is held to allow multiple RSVP messages to be bundled into a single PDU. The default bundle-message-time is 1000 milliseconds (one second). The bundle-message-time value may be set to any value between 50 milliseconds and 3000 milliseconds (or 3 seconds). Message bundling is only attempted when it is enabled.

Note

Summary refresh must be enabled using the “enable mpls rsvp-te summary-refresh” command for a configured summary-refresh-time to actually be used.

Example

The following command sets the RSVP-TE hello time to 5 seconds on all MPLS interfaces:

```
configure mpls rsvp-te timers session hello-time 5 vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls static lsp transport

```
configure mpls static lsp lsp_name transport [ip-traffic [allow | deny]
   | vpn-traffic [allow {all | assigned-only} | deny]]
```

Description

Configures the type of traffic that can be transported across a static ingress LSP.

Syntax Description

lsp_name	Identifies the static LSP to be configured.
ip-traffic [allow | deny]	Specifies whether IP traffic is to be allowed or denied access to the LSP.
vpn-traffic [allow {all | assigned-only} | deny]	Specifies whether VPN traffic is to be allowed or denied access to the LSP. The optional assigned-only keyword limits the transport of VPN traffic to only those VPLS instances that are explicitly configured to use the specified LSP.

Default

N/A.

Usage Guidelines

This command has no effect if the named LSP is a transit or egress LSP. By default, IP traffic and VPN traffic are set to deny for a newly created static LSP. The transport configuration options are independent. For example, if VPN traffic is set to allow and IP traffic is set to deny, then no routed IP traffic is transported across the LSP, but the LSP can still transport VPN traffic. When configured to deny for IP traffic, the specified LSP cannot be configured as an IP next hop for a default or static route.

Example

The following command configures a static LSP to transport IP traffic and all VPN traffic:

```
configure mpls static lsp lsp598 transport ip-traffic allow vpn-traffic allow all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mpls static lsp

```
configure mpls static lsp lsp_name [{egress [egress_label |
   implicit-null] egress-vlan evlan_name next-hop ipaddress} {ingress
   ingress_label {ingress-vlan ivlan_name}}]
```

Description

Configures the ingress and egress segments of a static LSP.

Syntax Description

lsp_name	Identifies the static LSP to be configured.
egress_label	Specifies the egress label for the LSP. The supported range is x7FC00 to x803FF. The egress label should match the corresponding ingress label of the next hop. There is no egress label at the egress LSR of a static LSP.
egress implicit-null	If PHP is supported, an LSR can be configured to use the implicit-null label for LSPs that terminate at the next-hop LER.
evlan_name	Specifies the egress *VLAN* for the LSP.
ipaddress	Specifies the IP address for the next-hop router along the static LSP.
ingress_label	Identifies the ingress label for this LSP. The supported range is x7FC00 to x7FFFF at transit LSRs and 0x80000 to 0x803FF at destination LSRs. The ingress label should match the corresponding egress label of the previous hop. There is no ingress label at the ingress LSR of a static LSP.
ivlan_name	When an ingress label is specified, this argument optionally specifies the ingress VLAN for the LSP.

Default

N/A.

Usage Guidelines

The ingress and egress segments can be configured any time before enabling the LSP. At the ingress LER, only the egress segment is configured and at the egress LER, only the ingress segment is configured. For LSPs that transit an LSR, it is mandatory to configure both ingress and egress segments. On any given LSR, the ingress label, if present, must match the egress label on the upstream LSR and the egress label must match the ingress label of the downstream LSR. Once configured, any change to the ingress or egress segments requires administratively disabling the LSP first. If the next-hop IP address is not within the subnet as defined by the interface VLAN name, the configuration is rejected.

Example

The following command configures a static LSP on an ingress LSR:

```
configure mpls static lsp lsp1 egress 0x7fc01 egress-vlan v50 next-hop 50.0.0.2
```

The following command configures a static LSP on a transit LSR:

```
configure mpls static lsp lsp1 egress 0x80001 egress-vlan v100 next-hop 100.0.0.2 ingress
0X7FC01 ingress-vlan v50
```

The following command configures a static LSP on an egress LSR:

```
configure mpls static lsp lsp1 ingress 0x80001  ingress-vlan v100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support *MPLS* as described in the *Switch Engine 32.2 Feature License Requirements* document.

configure mrp ports timers

```
configure mrp ports [ port_list | all ] timers [{extended-refresh
   [extended_refresh | off]} {join join_msec } {leave leave_msec }
   {leave-all leave_all_msec } {periodic [periodic_msec | off]}]
```

Description

This command sets the join, leave, leave all, periodic, and extended-refresh timer values for a list of ports. The unit value is in milliseconds. The join timer, leave all timer, and periodic timer are started for each MRP application per port. The leave timer is started for each state machine that is in LV (leave) state. The default values for join, leave, leave-all, are 200, 600, and 10000, respectively. The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Syntax Description

mrp	Multiple Registration Protocol.
ports	Ports.
port_list	Port list separated by a comma or -" type="portlist_t".
all	All ports.
timers	Multiple Registration Protocol timers.

extended-refresh	Timer value to use in place of regular leave timer, only in cases when leave-all is received or sent.
extended_refresh_msec	Extended refresh timer value in milliseconds (range is 600 ms to 300000 ms, default is 10000 ms).
join	The time interval to delay sending MRP advertisements.
join_msec	Join timer value in milliseconds (range is 0 ms to 500 ms, default is 200 ms).
leave	The time interval to wait in the leaving state before transitioning to the empty state.
leave_msec	Leave timer value in milliseconds (range is 600 ms to 3000 ms, default is 600 ms).
leave-all	The time interval used to control the frequency of "leave all" messages.
leave_all_msec	Leave All timer value in milliseconds (range is 5000 ms to 20000 ms, default is 10000 ms).
periodic	The time interval between two periodic events.
periodic_msec	Periodic timer value in milliseconds (range is 1000ms to 300000 ms, default is 1000 ms); type="uint32_t".
off	Turn off timer.
refresh	Timer value to use in place of regular timer, only in cases when leave-all is received or sent.
auto-refresh	Automatically calculate timer values based on number of talkers and listeners.
refresh_msec	Refresh timer value in milliseconds (range is 600ms to 300000ms, default is 0ms (off)).

Default

The default values for join, leave, leave-all, are 200, 600, and 10000, respectively. The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Usage Guidelines

This command is used to set the join, leave, and leave-all timer values for a list of ports. The unit value is in milliseconds. The join timer and leave all timer are started for each MRP application per port. The leave timer is started for each state machine that is in LV (leave) state. The default values for these timers are 200, 600, and 10000, respectively.

```
configure mrp ports 4 timers join 300
configure mrp ports all timers leave-all 15000
configure mrp ports all timers join 300 leave-all 15000
```

History

This command was first available in ExtremeXOS 15.3.

The extended-refresh and period timer options were added in 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure msdp as-display-format

```
configure msdp as-display-format [asdot | asplain]
```

Description

Configures the AS number format displayed in show commands.

Syntax Description

asdot	Specifies the ASDOT format.
asplain	Specifies the ASPLAIN format.

Default

N/A.

Usage Guidelines

The ASPLAIN and ASDOT formats are described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command selects the ASDOT 4-byte AS number format:

```
configure msdp as-display-format asdot
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the *MSDP* feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp max-rejected-cache

```
configure msdp max-rejected-cache max-cache {vr vrname}
```

Description

Configures the maximum limit on rejected SA cache entries that an *MSDP* router will store in its database.

Syntax Description

max-cache	Specifies the maximum number of rejected SA cache entries that the MSDP router will store in its database. To remove the limit, enter 0 (zero) for the *max-cache* value.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the maximum cache entries stored is zero. That is, rejected SA cache entries are not stored. Any SA cache entries that are stored and not refreshed for six minutes are removed.

Usage Guidelines

SA cache are rejected because of:

- Peer-RPF failure
- Policy denied

When a previously rejected SA cache entry is accepted because of an RP reachability change or policy rule change, the rejected SA cache entry is moved to the accepted SA cache list.

By default, rejected SA cache entries are discarded. You can configure a limit for rejected cache entries to store them, which will help debug/diagnose some issues; however, it consumes extra memory.

Example

The following command sets the maximum rejected cache limit to 100 for an MSDP router:

```
configure msdp max-rejected-cache 100
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature,see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp originator-id

```
configure msdp originator-id ip-address {vr vrname}
```

Description

Configures the originator ID for an *MSDP* router. The originator ID is the RP address you want to use (instead of the default) in locally originated SA messages.

Syntax Description

ip-address	Specifies the RP address to use in locally originated SA messages. To unconfigure an originator ID (that is, to use the default RP address), enter the IP address 0.0.0.0.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the RP address is used as the originator ID in locally originated SA messages.

Usage Guidelines

Use this command to override the default RP address used in SA messages. Because only RPs and MSDP border routers originate SAs, there are times when it is necessary to change the ID used for this purpose. The originator ID address must be one of the interface addresses on the MSDP router.

You can configure the MSDP originator ID only when MSDP is disabled globally.

To remove an originator ID, enter the IP address 0.0.0.0.

Example

The following example configures the originator ID for an MSDP router:

```
configure msdp originator-id 10.203.134.1
```

The following example unconfigures the originator ID for an MSDP router:

```
configure msdp originator-id 0.0.0.0
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer default-peer

```
configure msdp peer [remoteaddr | all] default-peer {default-peer-policy
   filter-name} {vr vrname}
```

Description

This command configures a default or static RPF peer from which all *MSDP* SA messages are accepted. To remove the default peer, enter the `configure msdp peer no-default-peer` command.

Syntax Description

filter-name	Specifies the name of the policy filter associated with the default peer. The peer will be the default peer for all SA entries that are permitted by the policy filter. If an SA message is allowed by the policy filter, it will be accepted. Otherwise, the SA message has to go through the regular RPF-check. The static peer RPF check is the last step in peer RPF algorithm. So, if an SA message is denied by the default peer policy, ultimately the SA message will be rejected by MSDP.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no static RPF peer is configured.

The **default-peer-policy** keyword specifies the name of the policy filter associated with the default peer. You can configure multiple default peers with different policies. If no policy is specified, then the current peer is the default RPF peer for all SA messages.

Usage Guidelines

Configuring a default peer simplifies peer-RPF checking of SA messages. If the peer-RPF check fails, the default peer rule is applied to see if the SA messages should be accepted or rejected.

If a default peer policy is specified, the peer is the default peer only for the (Source, Group), or (S, G), that satisfies the policy. If the policy is not specified, then the default peer is used for all (S, G, RP).

You can configure multiple default peers on an MSDP router; however, all default peers must either have a default policy or not. A mix of default peers, with a policy and without a policy, is not allowed.

When configuring multiple default peer rules, follow these guidelines:

- When you enter multiple default-peer commands with the default-peer-policy keyword, you can use all the default peers at the same time for different RP prefixes.
- When you enter multiple default-peer commands without the default-peer-policy keyword, you can use a single active peer to accept all SA messages. If that peer goes down, then the next configured default peer accepts all SA messages. This configuration is typically used at a stub site.

You can use the following policy attributes in a default peer policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit.
  - deny.

Example

The following example configures an MSDP peer with the IP address 192.168.45.43 as the default peer policy for "sales":

```
configure msdp peer 192.168.45.43 default-peer default-peer-policy sales
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer description

```
configure msdp peer remoteaddr description {peer-description} {vr
   vrname}
```

Description

Configures a name or description for an *MSDP* peer. This text is for display purposes only.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer.
peer-description	Specifies the name or description of the MSDP peer. The maximum is 63 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no name or description is specified.

Usage Guidelines

Use this command to configure a name or description to make an MSDP peer easier to identify. The description is visible in the output of the `show msdp peer` command.

To remove the description, use this command without a description string.

Example

The following example configures the name "internal_peer" to an MSDP peer:

```
configure msdp peer 192.168.45.43 description internal_peer
```

The following example removes the description from an MSDP peer:

```
configure msdp peer 192.168.45.43 description
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer mesh-group

```
configure msdp peer [remoteaddr | all] mesh-group [mesh-group-name |
   none] {vr vrname}
```

Description

This command configures an *MSDP* peer to become a member of a mesh-group. To remove a peer from a mesh-group, enter the none CLI keyword for the mesh-group.

Syntax Description

mesh-group-name	Specifies the name of the MSDP mesh-group.
none	Removes a peer from a mesh-group.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Any SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group.

Mesh-groups achieve two goals:

- Reduce SA message flooding.
- Simplify peer-RPF flooding.

Example

The following example configures an MSDP peer with the IP address 192.168.45.43 to become a member of a mesh-group called "intra":

```
configure msdp peer 192.168.45.43 mesh-group intra
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer no-default-peer

```
configure msdp peer [remoteaddr | all] no-default-peer {vr vrname}
```

Description

This command removes a default peer.

Syntax Description

peer all	Specifies all *MSDP* peers.
remoteaddr	Specifies the IP address of the MSDP peer.
no-default-peer	Removes a default peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes all MSDP peers:

```
configure msdp peer all no-default-peer
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer password

```
configure msdp peer [remoteaddr | all] password {none | {encrypted}
   encrypted_tcp_password | tcp_password } {vr vrname}
```

Description

This command configures a TCP RSA Data Security, Inc. *MD5* Message-Digest Algorithm password for an *MSDP* peer.This command enables TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication for a MSDP peer. When a password is configured, MSDP receives only authenticated MSDP messages from its peers. All MSDP messages that fail TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication are dropped.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
none	Removes the previously configured password.
encrypted	Encrypts the password for RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication. To improve security, the password displays in encrypted format and cannot be seen as simple text. Additionally, the password is saved in encrypted format.
tcpPassword	Specifies the password to use for RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication at the TCP level. The password must be an ASCII string with a maximum of 31 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Defaults

By default, TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication is disabled for the MSDP peer.

Usage Guidelines

We recommend that you enable TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication for all MSDP peers to protect MSDP sessions from attacks. You can execute this command only when the MSDP peer is disabled or when MSDP is globally disabled on that VR.

Example

The following example configures a password for the MSDP peer with the IP address 192.168.45.43, which automatically enables TCP MD5 authentication:

```
configure msdp peer 192.168.45.43 password test123
```

The following command removes the password:

```
configure msdp peer 192.168.45.43 password none
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer sa-filter

```
configure msdp peer [remoteaddr | all] sa-filter [in | out] [filter-name
   | none] {vr vr_name}
```

Description

This command configures an incoming or outgoing policy filter for SA messages.

Syntax Description

peer all	Specifies all *MSDP* peers.
remoteaddr	Specifies the IP address of the MSDP peer.
in	Associates the SA filter with inbound SA messages.
out	Associates the SA filter with outbound SA messages.

filter-name	Specifies the name of the policy associated with an SA filter. To remove an SA filter, enter the **none** CLI keyword instead of *filter-name*.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no SA filter is configured for an MSDP peer. That is, incoming and outgoing SA messages are not filtered.

Usage Guidelines

This command configures an SA filter such that only a specified set of SA messages are accepted or sent to a peer. Note that an SA filter does not adversely impact the flow of SA request and response messages.

To remove an SA filter, enter the **none** CLI keyword instead of *filter-name*.

You can use the following policy attributes in an SA filter policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following example configures an incoming SA messages filter on an MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 sa-filter in allow_229
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer sa-limit

```
configure msdp peer [remoteaddr | all] sa-limit max-sa {vr vr_name}
```

Description

This command allows you to limit the number of SA entries from an *MSDP* peer that the router will allow in the SA cache. To allow an unlimited number of SA entries, use 0 (zero) as the value for *max-sa*.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
max-sa	Specifies the maximum number of SA entries from an MSDP peer allowed in the SA cache. To specify an unlimited number of SA entries, use 0 (zero) as the value for *max-sa*.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no SA entry limit is set. The router can receive an unlimited number of SA entries from an MSDP peer.

Usage Guidelines

You can use this command to prevent a distributed denial of service (DOS) attack. We recommend that you configure an MSDP SA limit on all MSDP peer sessions. Note that a rejected SA cache entry is not included in the number of SA cache entries received from a peer.

Example

The following example configures the SA entry limit of 500 for the MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 sa-limit 500
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer source-interface

```
configure msdp peer [remoteaddr | all] source-interface [ipaddress |
   any] {vr vrname}
```

Description

This command configures the source interface for the *MSDP* peer TCP connection.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
ipaddress	Specifies the IP address of the MSDP router interface to use on one end of a TCP connection. The ipaddress must be one of the MSDP router interface addresses; otherwise, the command fails and an error message displays.
any	Specifies to use any interface as one end of the TCP connection. The source interface is selected based on the IP route entry used to reach the MSDP peer. The egress interface that reaches the MSDP peer is used as the source interface for the TCP connection. Basically, this command removes the previously configured source interface of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Defaults

By default, the source interface is selected based on the IP route entry used to reach the MSDP peer. The egress interface that reaches the MSDP peer is used as the source interface for the TCP connection.

Usage Guidelines

You must first disable MSDP or the MSDP peer before using this command. We recommend that you configure a source interface for MSDP peers that are not directly connected. We also recommend using the loopback address as the MSDP peer connection endpoint.

Example

The following example configures a source interface for an MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 source-interface 60.0.0.5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer timer

```
configure msdp peer [remoteaddr | all] timer keep-alive keep-alive-sec
   hold-time hold-time-sec {vr vrname}
```

Description

The command configures the keep-alive and hold timer intervals of the *MSDP* peers.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
keep-alive-sec	Specifies the keep-alive timer interval in seconds. The range is1–60 seconds.
hold-time-sec	Specifies the hold timer interval in seconds. The range is 3–75 seconds.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the:

- Keep-alive timer interval is 60 seconds.
- Hold timer interval is 75 seconds.
- SA timer interval is 60 seconds.

Usage Guidelines

You can use this command only when either MSDP or the MSDP peer is disabled. The hold timer interval must be greater than the keep-alive timer interval.

Example

The following example configures the keep-alive and hold timer intervals for the MSDP peer 55.0.0.83:

```
configure msdp peer 55.0.0.83 timer keep-alive 30 hold-time 60
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp peer ttl-threshold

```
configure msdp peer [remoteaddr | all] ttl-threshold ttl {vr vrname}
```

Description

Configures the limit to which multicast data packets are sent in SA messages to an *MSDP* peer. If the time-to-live (TTL) in the IP header of an encapsulated data packet exceeds the TTL threshold configured, encapsulated data is not forwarded to MSDP peers.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer on which to configure a TTL threshold.
all	Specifies all MSDP peers.
ttl	Specifies the TTL value. The range is 0–255. To restore the default value, enter a TTL value of 0 (zero).
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

The default value is zero, meaning all multicast data packets are forwarded to the peer regardless of the TTL value in the IP header of the encapsulated data packet.

Usage Guidelines

This command allows you to configure a TTL value to limit multicast data traffic.

Example

The following example configures a TTL threshold of 5:

```
configure msdp peer 192.168.45.43 ttl-threshold 5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msdp sa-cache-server

```
configure msdp sa-cache-server remoteaddr {vr vr_name}
```

Description

Configures the *MSDP* router to send SA request messages to the MSDP peer when a new member becomes active in a group.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer from which the local router requests SA messages when a new member becomes active in a group, and MSDP has no cache entry for the group in the local database.
vr_name	Specifies the name of the virtual router on which the MSDP cache server is configured. If a virtual router name is not specified, it is extracted from the current CLI context.

Default

By default, the router does not send SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member simply waits to receive SA messages, which eventually arrive.

Usage Guidelines

You can use this command to force a new member of a group to learn the current active multicast sources in a connected PIM-SM domain that are sending to a group. The router will send SA request messages to the specified MSDP peer when a new member joins a group and MSDP doesn't have a cache entry for that group in the local database. The peer replies with the information in an SA cache response message.

Note

An MSDP peer must exist before it can be configured as an SA cache server. The configure msdp sa-cache-server command accepts the value for *remoteaddr* only if it is an existing peer's IP address.

Example

The following example configures an MSDP cache server:

```
configure msdp sa-cache-server 172.19.34.5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msrp latency-max-frame-size

```
configure msrp [ latency-max-frame-size frame_size | [ igonore-latency-
   changes | talker-vlan-pruning ] [ on | off ] ]
```

Description

This command configures the system-wide MSRP variables.

Syntax Description

msrp	Multiple Stream Registration Protocol.
latency-max-frame-size	Maximum size of interfering frame (used in latency calculations).
frame_size	The maximum frame size in bytes (range 64 to 2000, default is 1522).
ignore-latency-changes	Ignore accumulated latency changes when evaluating first value change.
talker-vlan-pruning	Talker propagation is filtered on ports where *VLAN* does not exist.
on	Turn on.
off	Turn off.

Default

1522.

Usage Guidelines

Use this command to configure the system-wide MSRP variables.

Example

```
# configure msrp latency-max-frame-size 100
```

History

This command was first available in ExtremeXOS 15.3. The ignore-latency-changes, talker-vlan-pruning, and on | off options were added in 15.3.2.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msrp ports sr-pvid

```
configure msrp ports [port_list | all] sr-pvid vlan_tag
```

Description

Specifies the default *VLAN* ID on the port for MSRP data stream. The sr-pvid serves as a recommendation to connected AVB devices; AVB devices may still use other VLAN IDs if they are configured to do so.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	List of ports in the switch.
all	All the ports in the switch.
sr-pvid	Default VLAN Identifier for stream-related traffic.
vlan_tag	VLAN ID ranging from 1 to 4094 (default is 2).

Default

2.

Usage Guidelines

Use this command to specify the default VLAN ID on the port for MSRP data streams. The sr-pvid serves as a recommendation to connected AVB devices; AVB devices may still use other VLAN IDs if they are configured to do so.

Example

```
# configure msrp ports 1,2,3 sr-pvid 2
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license,

and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msrp ports traffic-class delta-bandwidth

```
configure msrp ports [port_list | all] traffic-class [A | B] delta-
   bandwidth percentage
```

Description

Configures delta-bandwidth value per traffic class per MSRP port.

Syntax Description

msrp	Multiple Stream Registration Protocol.
port_list	List of ports in the switch.
traffic-class	Traffic class.
A	Traffic class A.
B	Traffic class B.
delta-bandwidth	Delta-bandwidth percentage (range 0 to 100, default 75 for class A, 0 for class B).

Default

Class A: 75, Class B: 0.

Usage Guidelines

The delta bandwidth configuration limits the amount of bandwidth that can be used by the given stream reservation class. Each class is allowed to use a maximum of its delta bandwidth plus the delta bandwidth configured for each of the higher classes. For example, if the delta bandwidth for classes A and B are configured to 10 and 10 respectively, class A streams can use up to 10 percent of the link bandwidth, and class B streams can us up to 20 percent of the link bandwidth. The sum of the class A and B delta bandwidth values must be less than 100 percent.

Example

```
# configure msrp ports all traffic-class A delta-bandwidth 50
# configure msrp ports 1-5 traffic-class B delta-bandwidth 0
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msrp sharing

```
configure msrp sharing [all | port_list] bandwidth [cumulative | single-
   port] percentage
```

Description

This command configures the *LAG* bandwidth mode as either cumulative or master-port only.

Syntax Description

all	All the ports in the switch.
port_list	Port list separated by a comma or -
cumulative	Use bandwidth of a single port, plus a percentage of bandwidth of every other LAG member port in the group.
single-port	Use bandwidth of a single port only for the entire LAG.
percentage	Percentage of bandwidth of each LAG port to be added to master port bandwidth.

Default

Single-port.

Usage Guidelines

If cumulative mode is selected, the percentage is also configured.

Example

This CLI command displays bandwidth information of an MSRP port.

```
# show msrp ports bandwidth
Port       Port  Class    Delta    Maximum   Reserved   Available
          Speed                    Effective
------   ------- -----   --------- ---------  ---------  ---------
5ab          0 M A          75.00%   0.00%       0.00%      0.00%
                 B           0.00%   0.00%       0.00%      0.00%
*21ab     1000 M A          75.00%   75.00%      0.00%     75.00%
                 B           0.00%   75.00%      0.00%     75.00%
Flags: (*) Active, (!) Administratively disabled,
       (a) SR Class A allowed, (b) SR Class B allowed.
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure msrp timers first-value-change-recovery

```
configure msrp timers first-value-change-recovery
   [first_value_change_msec | off]
```

Description

This command configures MSRP first value change recovery timer, or disables the timer. If configured, the system waits until the configured timer value before allowing recovery of streams from first value change failure. If disabled, the system does not recover from first value change failure.

Syntax Description

msrp	Multiple Stream Registration Protocol.
timers	Multiple Stream Registration Protocol timers.
first-value-change-recovery	The time interval to wait to allow recovery of stream from first value change failure.
first_value_change_msec	First Value Change Recovery time in milliseconds (range is 10000 ms to 5400000 ms, default is 30000 ms); type="uint32_t"; range="[10000, 5400000]".
off	Turn off first value change recovery timer, and do not recover from first value change failure.

Default

30000 ms.

Usage Guidelines

Use this command to allow streams to recover from first value change failure.

Example

```
# configure msrp timers first-value-change recovery 20000
# configure msrp timers first-value-change recovery off
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mstp format

```
configure mstp format format_identifier
```

Description

Configures the number used to identify the *MSTP* BPDUs sent in the MSTP region.

Syntax Description

format_identifier	Specifies a number that MSTP uses to identify all BPDUs sent in the MSTP region. The default is 0. The range is 0 to 255.

Default

The default value used to identify the MSTP BPDU is 0.

Usage Guidelines

For a switch to be part of an MSTP region, you must configure each switch in the region with the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

You can configure only one MSTP region on the switch at any given time.

The switches contained in a region transmit and receive BPDUs that contain information relevant to only that MSTP region. By having devices look at the region identifiers, MSTP discovers the logical boundary of a region.

If you have an active MSTP region, Extreme Networks recommends that you disable all active STPDs in the region before modifying the value used to identify MSTP BPDUs on all participating switches.

Example

The following command configures the number 2 to identify the MSTP BPDUs sent within an MSTP region:

```
configure mstp format 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mstp region

```
configure mstp region regionName
```

Description

Configures the name of an *MSTP* region on the switch.

Syntax Description

regionName	Specifies a user-defined name for the MSTP region. May be up to 32 characters.

Default

By default, the switch uses the MAC address of the switch to generate an MSTP region.

Before you configure the MSTP region, it also has the following additional defaults:

- MSTP format Identifier—0.
- MSTP Revision Level—3.

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, mstp. Names must start with an alphabetical character, for example, a, Z.

By default, the switch uses the unique MAC address of the switch to generate an MSTP region. Since each MAC address is unique, every switch is in its own region by default.

For multiple switches to be part of an MSTP region, you must configure each switch in the region with the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

You can configure only one MSTP region on the switch at any given time.

The switches inside a region exchange BPDUs that contain information for MSTIs. The switches connected outside of the region exchange CIST information. By having devices look at the region identifiers, MSTP discovers the logical boundary of a region.

If you have an active MSTP region, we recommend that you disable all active STPDs in the region before renaming the region on all of the participating switches.

Viewing MSTP Information

To view the MSTP configuration on the switch, use the `show stpd` command. Output from this command contains global MSTP settings, including the name of the MSTP region, the number or tag that identifies all of the BPDUs sent in the MSTP region, and the reserved MSTP revision level. If configured, the output also displays the name of the Common and Internal Spanning Tree (CIST), and the number of Multiple Spanning Tree Instances (MSTIs).

Example

The following example creates an MSTP region named purple:

```
configure mstp region purple
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mstp revision

```
configure mstp revision revision
```

Description

Configures the revision number of the *MSTP* region.

Syntax Description

revision	This parameter is reserved for future use.

Default

The default value of the revision level is 3.

Usage Guidelines

Although this command is displayed in the CLI, it is reserved for future use. Please do not use this command.

If you accidentally configure this command, remember that each switch in the region must have the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—An unsigned integer encoded within a fixed field of 2 octets that identifies the revision of the current MST configuration. MSTP revision level can be set from 0 to 65536, with the default being 3. The revision number is not incremented automatically each time that the MST configuration is committed.

Example

The following command returns the MSTP revision number to 3, the default revision number:

```
configure mstp revision 3
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mvr add receiver

`configure mvr` **`vlan`** *`vlan-name`* **`add receiver port`** *`port-list`*

Description

Configures a port to receive MVR multicast streams.

Syntax Description

vlan-name	Specifies a *VLAN* name.
port-list	A list of ports or slots and ports.

Default

N/A.

Usage Guidelines

This command is used to add a group of virtual ports for multicast forwarding through MVR. By default, some ports on non-MVR VLANs (router ports, primary and secondary *EAPS* ports), are excluded from the MVR cache egress list. This command is used to override these rules, so that if valid *IGMP* memberships are received, or a router is detected, streams are forwarded out on the ports.

Example

The following example adds the ports 1:1 and 1:2 of VLAN v1 to MVR for forwarding:

```
configure mvr vlan v1 add receiver port 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvr add vlan

`configure mvr add vlan` *vlan-name*

Description

Configures a *VLAN* as an MVR VLAN.

Syntax Description

vlan-name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Configures MVR on the specified VLAN. When a multicast stream in the specified MVR address range is received on the VLAN, it is leaked to all other VLAN ports where the corresponding *IGMP* join message is received. By default, the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24 is used for MVR. To change the MVR address range, use the following command:

`configure mvr vlan` *`vlan-name`* `mvr-address {`*`policy-name`* `|` **`none`**`}`

Example

The following example configures VLAN v1 as an MVR VLAN:

```
configure mvr add vlan v1
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvr delete receiver

`configure mvr` **`vlan`** *`vlan-name`* **`delete receiver port`** *`port-list`*

Description

Configures a port not to receive MVR multicast streams.

Syntax Description

`vlan-name`	Specifies a *VLAN* name.
`port-list`	A list of ports or slots and ports.

Default

N/A.

Usage Guidelines

This command is used to delete a group of virtual ports for multicast forwarding through MVR. After using this command, the ports revert to the default forwarding rules.

Example

The following example deletes the ports 1:1 and 1:2 of VLAN v1 to MVR for forwarding:

```
configure mvr vlan v1 delete receiver port 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvr delete vlan

```
configure mvr delete vlan vlan-name
```

Description

Deletes a *VLAN* from MVR.

Syntax Description

vlan-name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Removes MVR from the specified VLAN.

Example

The following example configures VLAN v1 as a non-MVR VLAN:

```
configure mvr delete vlan v1
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvr mvr-address

```
configure mvr vlan vlan-name mvr-address {policy-name | none}
```

Description

Configures the MVR address range on a *VLAN*.

Syntax Description

vlan-name	Specifies a VLAN name.
policy-name	Specifies a policy file.

Default

The default address range is 224.0.0.0/4 (all multicast addresses), but excluding 224.0.0.0/24 (the multicast control range).

Usage Guidelines

If no policy file is specified (the **none** option), the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24 is used for MVR.

MVR must first be configured on the VLAN before using this command.

If the policy is later refreshed, groups denied and newly allowed groups in the policy are flushed from fast path forwarding. This allows synching existing channels with the new policy, without disturbing existing channels.

The following is a sample policy file mvrpol.pol. This policy configures 236.1.1.0/24 as the MVR address range. Any address outside this range has the standard switching behavior on an MVR VLAN.

```
Entry extreme1 {
    if match any {
        nlri  236.1.1.0/24 ;
    }
    then {
        permit ;
    }
}
```

Example

The following example configures the MVR address range specified in the policy file mvrpol.pol for the VLAN v1:

```
configure mvr vlan v1 mvr-address mvrpol
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvr static group

```
configure mvr vlan vlan-name static group {policy-name | none}
```

Description

Configures the MVR static group address range on a *VLAN*.

Syntax Description

vlan-name	Specifies a VLAN name.
policy-name	Specifies a policy file.

Default

By default, all the MVR group addresses work in static mode.

Usage Guidelines

If no policy file is specified (the **none** option), the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24, is used for static groups in MVR.

MVR must first be configured on the VLAN before using this command.

The following is a sample policy file mvrpol.pol. This policy configures 236.1.1.0/24 as the MVR static group address range. Any MVR addresses outside this range are dynamically registered through *IGMP*. An MVR VLAN will proxy join only for addresses that are not in the static group. If you want all the multicast groups to by dynamic, use a policy file with this command that denies all multicast addresses.

```
Entry extreme1 {
    if match any {
        nlri  236.1.1.0/24 ;
    }
    then {
```

```
        permit ;
    }
}
```

Example

The following example configures the MVR static group address range specified in the policy file mvrpol.pol for the VLAN v1:

```
configure mvr vlan v1 static group mvrpol
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure mvrp stpd

```
configure mvrp stpd stpd_name
```

Description

Configures the *STP* domain to use for dynamically created *VLAN*s.

Syntax Description

mvrp	Multiple VLAN Registration Protocol.
stpd	The STP domain used for MVRP.
stpd_name	The STP domain the VLAN is to be associated. All ports of the domain will be advertised, when this VLAN gets registered.

Default

s0.

Usage Guidelines

Use this command to configure the STP domain used for MVRP.

Example

The following example configures the default STP domain for MVRP to "stpd2":

```
configure mvrp stpd stpd2
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mvrp tag ports registration

```
configure mvrp tag vlan_tag ports [port_list |all] registration
   [forbidden |normal ]
```

Description

This command is used for per port setting for the *VLAN* registration. If the global registration is forbidden, ports cannot be added to any VLAN dynamically irrespective of the per-port setting. So for ports to be registered, the global and the per-port setting both should be “normal”, which is the default value.

Syntax Description

mvrp	Multiple VLAN Registration Protocol.
tag	The 802.1Q VLAN ID.
vlan_tag	VLAN ID ranging from 1 to 4094; type=uint16_t"; range="[1,4094]".
ports	Ports.
port_list	Port list separated by a comma or -"; type="portlist_t";
all	All ports.
registration	Whether port can be added dynamically to the VLAN.
forbidden	Port cannot be added dynamically to the VLAN.
normal	Port can be added dynamically to the VLAN.

Default

Normal.

Usage Guidelines

Use this command to control dynamic addition of ports to VLANs.

Example

```
configure mvrp tag 2 ports 2,3,4 registration forbidden

configure mvrp tag 2 ports all registration normal
```

History

This command was first available in ExtremeXOS 15.3.

The registration option, and forbidden and normal keywords were added in 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mvrp tag ports transmit

```
configure mvrp tag vlan_tag ports [port_list | all] transmit [on | off ]
```

Description

Controls whether the given *VLAN* ID may be advertised in MVRP messages transmitted on the given set of ports.

Syntax Description

mvrp	Multiple VLAN Registration Protocol.
tag	The 802.1Q VLAN ID.
transmit	When enabled, MVRP message are sent on the ports.
on	Transmission of MVRP messages are enabled on the port(s) for the given tag.
off	Transmission of the MVRP messages are disabled on the port(s) for the given tag.

Default

Transmit on.

Usage Guidelines

Use this command to control whether the given VLAN ID may be advertised in MVRP messages transmitted on the given set of ports.

Example

The following command configures transmit off for VLAN ID 100 on all MVRP ports:

```
configure mvrp tag 100 ports all transmit off
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mvrp vlan auto-creation

```
configure mvrp vlan auto-creation [on | off]
```

Description

Enables or disables the dynamic *VLAN* creation feature of MVRP.

Syntax Description

mvrp	Multiple VLAN Registration Protocol.
auto-creation	When enabled, results in VLANs added dynamically on the switch through MVRP.
on	Enable auto-creation.
off	Disable auto-creation.

Default

Enabled.

Usage Guidelines

Use this command to enable or disable the dynamic VLAN creation of MVRP. By default, auto-creation is enabled. If disabled, the switch may participate in the MVRP protocol, and advertised static VLANs, but will not dynamically create VLANs.

Example

The following command enables MVRP VLAN auto creation:

```
configure mvrp vlan auto-creation on
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure mvrp vlan registration

```
configure mvrp vlan registration forbidden | normal
```

Description

This command is a global system setting. If global registration is forbidden, ports cannot be added to any *VLAN* dynamically.

Syntax Description

mvrp	Multiple VLAN Registration Protocol.
vlan	VLAN.
registration	Whether all ports can be added to new dynamic VLANs. This can be overridden by static port addition to VLAN.
forbidden	Ports cannot be added dynamically to the VLAN. This can be overridden by static port addition.
normal	Ports can be added dynamically to the VLAN (default).

Default

Normal.

Usage Guidelines

Use this command to set global registration. If global registration is forbidden, ports cannot be added to any VLAN dynamically.

Example

The following command allows ports to be added dynamically to the VLAN:

```
configure mvrp vlan registration normal
```

History

This command was first available in ExtremeXOS 15.3.

The **registration** keyword was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure neighbor-discovery cache add

```
configure neighbor-discovery cache {vr vr_name} add [ipv6address |
   scoped_link_local] mac
```

Description

Adds a static entry to the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
scoped_link_local	Specifies a scoped, link-local address.
mac	Specifies a MAC address.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

This command adds static entries to the neighbor cache.

Example

The following example adds a static entry to the neighbor cache:

```
configure neighbor-discovery cache add fe80::2315%default 00:11:22:33:44:55
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache delete

```
configure neighbor-discovery cache {vr vr_name} delete [ipv6address |
   scoped_link_local]
```

Description

Deletes a static entry from the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
scoped_link_local	Specifies a scoped, link-local address.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

This command deletes static entries from the neighbor cache.

Example

The following example deletes a static entry from the neighbor cache:

```
configure neighbor-discovery cache delete fe80::2315%default
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache locktime

`configure neighbor-discovery cache {`**`vr`** *`vr_name`*`}{`**`locktime`** *`locktime`*`}`

Description

Sets the time before a new entry can replace an old entry in the Neighbor Discovery Protocol (NDP) cache of neighbor IPv6 addresses\MAC addresses.

Syntax Description

vr	Specifies setting a VR or VRF.
vr_name	Specifies the name of the VR or VRF.

locktime	Specifies setting a time before a new entry can replace an old entry.
locktime	Sets the locktime value in milliseconds with a range of 0–30,000. Default is 1,000 milliseconds.

Default

The default locktime is 1,000 milliseconds.

Example

The following example sets the locktime to 5,000 milliseconds:

```
configure neighbor-discovery cache locktime 5000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache max_entries

```
configure neighbor-discovery cache max_entries max_entries
```

Description

Configures the maximum allowed IPv6 neighbor entries.

Syntax Description

max_entries	Specifies the maximum allowed IPv6 neighbor entries. The range is 1 to 49,152.

Default

8,192.

Usage Guidelines

For ExtremeXOS 30.1, the maximum configurable limit for neighbor discovery maximum entries is changed to 49,152 for all platforms. A message appears if the configured value exceeds the theoretical hardware maximum limit depending on the platform.

Example

The following example sets the maximum allowed IPv6 neighbor entries to 512:

```
configure neighbor-discovery cache max_entries 512
```

History

This command was first available in ExtremeXOS 12.4.

Per virtual router capability was deprecated and the maximum configurable limit set to 49,152 in ExtremeXOS 30.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache max_pending_entries

```
configure neighbor-discovery cache max_pending_entries
   max_pending_entries
```

Description

Configures the maximum number of pending IPv6 neighbor entries.

Syntax Description

max_pending_entries	Specifies the maximum number of pending IPv6 neighbor entries. The range is 1 to 4096.

Default

1,024.

Usage Guidelines

None.

Example

The following example sets the maximum number of pending IPv6 neighbor entries to 2,056:

```
configure neighbor-discovery cache max_pending_entries 2056
```

History

This command was first available in ExtremeXOS 12.4.

Per virtual router capability was deprecated in ExtremeXOS 30.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache reachable-time

```
configure neighbor-discovery cache {reachable-time [auto |
   {reachable_time [seconds | milliseconds]}]}
```

Description

Sets the value for Neighbor Discovery Protocol (NDP) reachable time

Syntax Description

reachable-time	Specifies setting the NDP reachable time.
reachable_time	Sets the value for the NDP reachable time (range is 1–1,474,515,000 millisecond or 1–1,474,515 second).
auto	Specifies having the NDP reachable time set automatically to 3/4 of the configured NDP timeout (default).
milliseconds	When setting the reachable time value, specifies milliseconds as the time unit (range is 1–1,474,515,000).
seconds	When setting the reachable time value, specifies seconds (range is 1–1,474,515) as the time unit (default).

Default

The default setting is for the reachable time to be set automatically to 3/4 of the configured NDP timeout. If you set the time manually, the default unit of measure for the value is seconds.

Example

The following example sets the reachable time to 500,000 seconds:

```
configure neighbor-discovery cache reachable-time 500000 seconds
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache retransmit-time

```
configure neighbor-discovery cache {retransmit-time retransmit_time}
```

Description

Sets the value for Neighbor Discovery Protocol (NDP) retransmit time

Syntax Description

retransmit-time	Specifies setting the retransmit time.
retransmit_time	Sets the retransmit time value (range is 1–4,294,967 seconds or 1–4,294,967,295 milliseconds). The default is 1 second.
milliseconds	When setting the retransmit time value, specifies milliseconds as the time unit (range is 1–4,294,967,295).
seconds	When setting the retransmit time value, specifies seconds (range is 1–4,294,967) as the time unit (default).

Default

The default setting for the retransmit time is 1 second. The default unit of measure is seconds.

Example

The following example sets the retransmit time to 500,000 seconds:

```
configure neighbor-discovery cache retransmit-time 500000 seconds
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document.

configure neighbor-discovery cache timeout

```
configure neighbor-discovery cache {vr vr_name} timeout timeout
```

Description

Configures a timeout value for entries in the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
timeout	Specifies a timeout value for neighbor cache entries. The range is 1 to 32767 minutes.

Default

20 minutes.

Usage Guidelines

None.

Example

The following example configures the neighbor cache timeout for 30 minutes:

```
configure neighbor-discovery cache timeout 30
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the *Switch Engine 32.2 Feature License Requirements* document./>

configure netlogin add mac-list

```
configure netlogin add mac-list [mac {mask} | default] {encrypted
   {encrypted_password | password} {ports port_list}
```

Description

Adds an entry to the MAC address list for MAC-based network login.

Syntax Description

mac	Specifies the MAC address to add.
mask	Specifies the number of bits to use for the mask.
default	Specifies the default entry.
encrypted	Used to display encrypted form of password in configuration files. Do not use.
password	Specifies the password to send for authentication.
ports	Specifies the port or port list to use for authentication.

Default

If no password is specified, the MAC address will be used.

Usage Guidelines

Use this command to add an entry to the MAC address list used for MAC-based network login.

If no match is found in the table of MAC entries, and a default entry exists, the default will be used to authenticate the client. All entries in the list are automatically sorted in longest prefix order.

configure netlogin add mac-list default configuration is added by default when **enable netlogin mac** is configured.

Associating a MAC Address to a Port

You can configure the switch to accept and authenticate a client with a specific MAC address. Only MAC addresses that have a match for the specific ports are sent for authentication. For example, if you associate a MAC address with one or more ports, only authentication requests for that MAC addresses received on the port(s) are sent to the *RADIUS (Remote Authentication Dial In User Service)* server. The port(s) block all other authentication requests that do not have a matching entry. This is also known as secure MAC.

To associate a MAC address with one or more ports, specify the ports option when using the `configure netlogin add mac-list [mac {mask} | default] {encrypted} {password} {portsport_list}` command.

You must enable MAC-based network login on the switch and the specified ports before using this command. If MAC-based network login is not enabled on the specified port(s), the switch displays a warning message similar to the following:

```
WARNING: Not all specified ports have MAC-Based NetLogin enabled.
```

If this occurs, make sure to enable MAC-based network login.

Example

The following command adds the MAC address 10:20:30:40:50:60 with the password foo to the list:

```
configure netlogin add mac-list 10:20:30:40:50:60 password foo
```

The following command associates MAC address 10:20:30:40:50:70 with ports 2:2 and 2:3. This means authentication requests from MAC address 10:20:30:40:50:70 are only accepted on ports 2:2 and 2:3:

```
configure netlogin add mac-list mac 10:20:30:40:50:70 ports 2:2-2:3
```

History

This command was first available in ExtremeXOS 11.1.

The ports option was added in ExtremeXOS 11.3.

Default configuration when **enable netlogin mac** is entered was added in ExtremeXOS 31.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches..

configure netlogin add proxy-port

```
configure netlogin add proxy-port tcp_port {http | https}
```

Description

Configure the ports that will be hijacked and redirected for HTTP or HTTPS traffic.

Syntax Description

tcp_port	Specifies the port to be hijacked.

Default

HTTP traffic.

Usage Guidelines

This command allows you to configure the ports that will be hijacked and redirected for HTTP or HTTPS traffic. For each hijacked proxy port, you must specify whether the port is to be used for HTTP or HTTPS traffic.

No more than 5 such ports are supported in addition to ports 80 and ports 443. Attempts to add more than 5 ports generate an error.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin agingtime

```
configure netlogin agingtime minutes
```

Description

Lets you configure network login aging.

Syntax Description

minutes	Specifies the aging time in minutes.

Default

The default value is 5.

Usage Guidelines

Use this command to configure the aging time for network login. The aging time is the time after which learned clients that failed authentication or did not attempt to authenticate are removed from the system. This prevents the switch from keeping all clients ever seen on a network-login-enabled port.

The range can be from 0 to 3000, where 0 indicates no age out.

Example

The following command specifies an aging time of 15 minutes:

```
configure netlogin agingtime 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin allowed-refresh-failures

`configure netlogin allowed-refresh-failures` *`num_failures`*

Description

Sets the number refresh failures.

Syntax Description

`num_failures`	Specifies the number of refresh failures. The range is from 0 to 5.

Default

The default is 0.

Usage Guidelines

This command allows you to set the number of refresh failures allowed. You can set the number of failures to be from between 0 to 5. The default value is 0.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin authentication database-order

```
configure netlogin [mac | web-based] authentication database-order
   [[radius] | [local] | [radius local] | [local radius]]
```

Description

Configures the order of database authentication protocols to use.

Syntax Description

mac	Specifies MAC-based authentication.
web-based	Specifies Web-based authentication.
radius	Specifies an authentication order from only the *RADIUS* database.
local	Specifies an authentication order from only the local database.
radius local	Specifies an authentication order of RADIUS database first, followed by local.
local radius	Specifies an authentication order of local database first, followed by RADIUS.

Default

By default, the authentication order is RADIUS, local-user database.

Usage Guidelines

As of ExtremeXOS 16.1, the functionality of this command is more consistent with management authentications. If RADIUS responds with a reject, then that reject is honored. The only time the local database is checked is when the RADIUS server does not respond.

Example

The following command sets the database authentication order to local-user database, RADIUS:

```
configure netlogin mac authentication database-order local radius
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin authentication failure vlan

```
configure netlogin authentication failure vlan vlan_name {ports
   port_list}
```

Description

Configures authentication failure *VLAN* on network login enabled ports.

Syntax Description

vlan_name	Specifies the name of the authentication failure VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Default

By default, authentication failure VLAN is configured on all network login enabled ports if no port is specifically configured.

Usage Guidelines

Use this command to configure authentication failure VLAN on network login enabled ports. When a supplicant fails authentication, it is moved to the authentication failure VLAN and is given limited access until it passes the authentication either through *RADIUS* or local. Depending on the authentication database order for that particular network login method (MAC, web or dot1x), the other database is used to authenticate the client. If the final result is an authentication failure and if the authentication failure VLAN is configured and enabled on that port, the client is moved to that location.

There four different authentication orders which can be configured per authentication method currently. They are:

- RADIUS.
- local.
- RADIUS, local.
- local, RADIUS.

In each case, you must consider the end result in deciding whether to authenticate the client in authentication failure VLAN or authentication service unavailable VLAN (if configured).

For example, when netlogin mac authentication database order is local, radius, if the authentication of a MAC client fails through a local database, RADIUS is used for authentication. If RADIUS also fails authentication, the client is moved to authentication failure VLAN. The same is true for all authentication database orders (radius,local; local,radius; radius; local).

If authentication through local fails, but passes through RADIUS, the client is moved to the appropriate destination VLAN.

If the local authentication fails and the RADIUS server is not available, the client is not moved to authentication failure VLAN.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin authentication protocol-order

```
configure netlogin authentication protocol-order [[dot1x [web-based |
   mac | cep]] | [mac [dot1x | web-based | cep]] | [web-based [dot1x |
   mac | cep]] | [cep [dot1x | web-based | mac]]]
```

Description

Globally configures the order of the Network Login (NetLogin) port's authentication protocols.

Syntax Description

dot1x	Configures the 802.1x authentication protocol preference.
mac	Configures the MAC-based authentication protocol preference.
web-based	Configures the web-based authentication protocol preference.
cep	Configure Convergence End Point (CEP) authentication protocol preference. CEP only appears as an option if policy is enabled.

Default

By default, the protocol precedence order for a NetLogin-enabled port is:

- Dot1x
- Web-based
- MAC
- CEP

Usage Guidelines

Web-based authentication occurs only when the port belongs to the NetLogin *VLAN*.

When you change the protocol precedence, the action for the current highest precedence protocol takes effect immediately if the client is authenticated by this protocol.

When you disable the highest precedence protocol on a port, the action for the next precedence protocol takes effect immediately if client is authenticated by this protocol.

CEP only appears as an option in the command if policy is enabled.

Example

The following example sets the protocol precedence order to Dot1x, Web-based, and MAC.

```
configure netlogin authentication protocol-order dot1x web-based mac cep
```

History

This command was first available in ExtremeXOS 15.7.1.

CEP option was added in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin authentication service-unavailable vlan

```
configure netlogin authentication service-unavailable [{add} | {delete}
   | {{vlan vlan_name} {ports port_list {tagged | untagged}}}]
```

Description

Configures authentication service-unavailable *VLAN* on NetLogin-enabled ports.

Syntax Description

vlan_name	Specifies the name of the service-unavailable VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.
add	Add service-unavailable VLAN to ports (default).
tagged	Configure port as tagged to the service-unavailable VLAN.
untagged	Configure port as untagged to the service-unavailable VLAN (default).
delete	Delete existing service-unavailable VLAN from ports.

Default

If a port is not specified, all NetLogin-enabled ports are applied.

If not specified, the command adds service-unavailable VLAN to ports by default.

If not specified, the ports are configured as untagged to the service-unavailable VLAN by default.

Usage Guidelines

This command configures authentication service-unavailable VLAN(s) on the specified NetLogin-enabled ports. Authentication service-unavailable VLAN is configured on all the NetLogin-enabled ports, if no port is specifically selected. When an authentication service is not available to authenticate the NetLogin clients, they are moved to the authentication service-unavailable VLAN(s) and are given limited access until the authentication service is available through *RADIUS*.

Starting with ExtremeXOS 30.2, you can specify up to 10 service-unavailable VLANs per port.

As of ExtremeXOS 16.1, the functionality of this command is more consistent with management authentications. If RADIUS responds with a reject, then that reject is honored.

There are four different authentication orders that can be configured per authentication method currently. They are:

- RADIUS
- Local
- RADIUS, local
- Local, RADIUS

The service unavailable VLAN is used only when authentication order is "RADIUS". The authentication failure VLAN is used for all other modes (local; RADIUS, local; local, RADIUS).

For example, when the Netlogin MAC authentication database order is local, RADIUS, if the authentication of a MAC client fails through a local database, RADIUS is used for authentication. If RADIUS also fails authentication, the client is moved to the authentication failure VLAN.

Authentication service is considered to be unavailable for RADIUS in the following cases:

- RADIUS server is not running.
- RADIUS server is not configured on the switch.
- RADIUS server is configured but not enabled on the switch.

Note

If web is enabled on a port where Dot1x or MAC is also enabled, the authentication failure/service-unavailable VLAN configuration is not applicable to those clients where Dot1x or MAC clients that fail authentication or where authentication service is not available.

Example

The following example adds the service-unavailable VLAN "v1" on tagged ports 1 and 2:

```
# configure netlogin authentication service-unavailable add vlan v1 ports 1,2 tagged
```

History

This command was first available in ExtremeXOS 12.1.

The ability to configure multiple service-unavailable VLANs was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin banner

```
configure netlogin banner banner
```

Description

Configures the network login page banner.

Syntax Description

banner	Specifies the HTML code for the banner.

Default

The default banner is the Extreme Networks logo.

Usage Guidelines

The banner is a quoted, HTML string, that will be displayed on the network login page. The string is limited to 1024 characters.

This command applies only to the web-based authentication mode of network login.

Example

The following command configures the network login page banner:

```
configure netlogin banner "<html><head>Please Login</head></html>"
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin base-url

```
configure netlogin base-url url
```

Description

Configures the base URL for network login.

Syntax Description

url	Specifies the base URL for network login. Note: The netlogin base-url is restricted to 79 characters.

Default

The base URL default value is “network-access.com.”

Usage Guidelines

When you login using a web browser, you are redirected to the specified base URL, which is the DNS name for the switch.

You must configure a DNS name of the type “www.xx...xx.xxx” or “xx...xx.xxx”.

This command applies only to the web-based authentication mode of network login.

Example

The following command configures the network login base URL as access.net:

```
configure netlogin base-url access.net
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin delete mac-list

```
configure netlogin delete mac-list [mac {mask} | default]
```

Description

Deletes an entry from the MAC address list for MAC-based network login.

Syntax Description

mac	Specifies the MAC address to delete.
mask	Specifies the number of bits to use for the mask.
default	Specifies the default entry.

Default

N/A.

Usage Guidelines

Use this command to delete an entry from the MAC address list used for MAC-based network login.

Use this command to remove the default MAC-list configuration after running **enable netlogin mac**.

Example

The following command deletes the MAC address 10:20:30:40:50:60 from the list:

```
configure netlogin delete mac-list 10:20:30:40:50:60
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin delete proxy-port

```
configure netlogin delete proxy-port tcp_port
```

Description

Configure the ports that are to be hijacked and redirected for HTTP or HTTPS traffic.

Syntax Description

tcp_port	Specifies the port to be hijacked.

Default

N/A.

Usage Guidelines

This command allows you to unconfigure the ports that will be hijacked and redirected for HTTP or HTTPS traffic.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dot1x eapol-transmit-version

```
configure netlogin dot1x eapol-transmit-version eapol-version
```

Description

Configures the default EAPOL version sent in transmitted packets for network login.

Syntax Description

eapol-version	Specifies the EAPOL version. Choices are "v1" or "v2".

Default

The default is "v1".

Usage Guidelines

Although the ExtremeXOS software supports EAPOL version 2, some clients do not yet accept the version 2 EAPOL packets. The packet format for the two versions is the same.

Example

The following command changes the EAPOL version to 2:

```
configure netlogin dot1x eapol-transmit-version v2
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dot1x guest-vlan

```
configure netlogin dot1x guest-vlan vlan_name {ports port_list}
```

Description

Configures a guest *VLAN* for 802.1X authentication network login.

Syntax Description

vlan_name	Specifies the name of the guest VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Default

N/A.

Usage Guidelines

This command configures the guest VLAN for 802.1X on the current virtual router (VR).

Note

Beginning with ExtremeXOS 11.6, you can configure guest VLANs on a per port basis, which allows you to configure more than one guest VLAN per VR. In ExtremeXOS 11.5 and earlier, you can only configure guest VLANs on a per VLAN basis, which allows you to configure only one guest VLAN per VR.

If you do not specify any ports, the guest VLAN is configured for all ports.

Each port can have a different guest VLAN.

A guest VLAN provides limited or restricted network access if a supplicant connected to a port does not respond to the 802.1X authentication requests from the switch. A port always moves untagged into the guest VLAN.

Keep in mind the following when configuring guest VLANs:

- You must create a VLAN and configure it as a guest VLAN before enabling the guest VLAN feature.
- Configure guest VLANs only on network login ports with 802.1X enabled.
- Movement to guest VLANs is not supported on network login ports with MAC-based or web-based authentication.
- 802.1X must be the only authentication method enabled on the port for movement to guest VLAN.

- No supplicant on the port has 802.1X capability.
- You configure only one guest VLAN per virtual router interface.

Note

The supplicant does not move to a guest VLAN if it fails authentication after an 802.1X exchange; the supplicant moves to the guest VLAN only if it does not respond to an 802.1X authentication request.

Modifying the Supplicant Timer

By default, the switch attempts to authenticate the supplicant every 30 seconds for a maximum of three tries. If the supplicant does not respond to the authentication requests, the client moves to the guest VLAN. The number of authentication attempts is not a user-configured parameter.

To modify the supplicant response timer, use the following command and specify the supp-resp-timeout parameter:

```
configure netlogin dot1x timers [{server-timeout server_timeout}
{quiet-periodquiet_period} {reauth-period reauth_period {reauth-
maxmax_num_reauths}} {supp-resp-timeoutsupp_resp_timeout}]
```

If a supplicant on a port in the guest VLAN becomes 802.1X-capable, the switch starts processing the 802.1X responses from the supplicant. If the supplicant is successfully authenticated, the port moves from the guest VLAN to the destination VLAN specified by the *RADIUS* server.

Enabling Guest VLANs

To enable the guest VLAN, use the following command:

```
enable netlogin dot1x guest-vlan ports [all |ports]
```

Example

The following command creates a guest VLAN for 802.1X named guest for all ports:

```
configure netlogin dot1x guest-vlan guest
```

The following command creates a guest VLAN named guest for ports 2 and 3:

```
configure netlogin dot1x guest-vlan guest ports 2,3
```

History

This command was first available in ExtremeXOS 11.2.

The ports option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dot1x tag-eapol

```
configure netlogin dot1x tag-eapol [on | off]
```

Description

Configures receiving tagged EAPOL packets on dot1x-enabled ports.

Syntax Description

on	Turns EAPOL-tagged frames feature on.
off	Turns EAPOL-tagged frames feature off . Default is off.

Default

Default is off.

Usage Guidelines

When this feature is on and switch receives tagged EAPOL packet on dot1x-enabled ports, tagged EAPOL response is sent out on those ports. On untagged ports, the EAPOL frames are sent untagged. When this feature is off, switch sends unatgged EAPOL packets on all the tagged/untagged ports. This command allows you to authenticate dot1x users on tagged and unatagged ports.

This command is applicable only for policy-enabled mode.

Example

The following example enables the switch to send tagged EAPOL packets:

```
configure netlogin dot1x tag-eapol on
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dot1x timers

```
configure netlogin dot1x timers [{server-timeout server_timeout}
   {quiet-period quiet_period} {reauth-period reauth_period {reauth-max
   max_num_reauths}} {reauthentication [on | off] {supp-resp-timeout
   supp_resp_timeout}]
```

Description

Configures the 802.1X timers for network login.

Syntax Description

server-timeout	Specifies the timeout period for a response from the *RADIUS* server. The range is 1 to 120 seconds.
quiet-period	Specifies the time for which the switch will not attempt to communicate with the supplicant after authentication has failed. The range is 0 to 65535 seconds.
reauth-period	Specifies time after which the switch will attempt to re-authenticate an authenticated supplicant. The range is 0 to 86,400 seconds.
reauth-max	Specifies the maximum reauthentication counter value. The range is 1 to 10.
supp-resp-timeout	Specifies the time for which the switch will wait for a response from the supplicant. The range is 1 to 120 seconds.
reauthentication	Enables or disables dot1x reauthentication
on	Enables reauthentication.
off	Disables reauthentication.

Default

The defaults are as follows:

- server-timeout—30 seconds.
- quiet-period—60 seconds.
- reauth-period—3600 seconds.
- reauth-max—3.
- supp-resp-timeout—30 seconds.

Usage Guidelines

To disable re-authentication, specify 0 for the reauth-period parameter. (If reauth-period is set to 0, reauth-max value doesn't apply.)

If you attempt to configure a timer value that is out of range (not supported), the switch displays an error message. The following is a list of sample error messages:

- server-timeout—`ERROR: RADIUS server response timeout out of range (1..120 sec)`
- quiet-period—`%% Invalid number detected at '^' marker. %% Input number must be in the range [0, 65535].`
- reauth-period—%% Invalid input detected at '^' marker. %% Input number must be in the range [0, 86400].
- reauth-max—`ERROR: Re-authentication counter value out of range (1..10)`

- supp-resp-timeout—`ERROR: Input number must be in the range [1, 10].`
- greater than RADIUS timeout—`Dot1x server timeout should be configured with a value greater than the RADIUS server timeout.`

To display the 802.1X timer settings, use the `show netlogin` command with and without the **dot1x** option.

If reauthentication is enabled by this command, the session-timeout value sent from RADIUS has priority. If no value is sent from RADIUS, then the locally configured *reauth_period* defines the reauthentication period.

If the locally configured value is "0" with reauthentication off, and if any session timeout value sent from RADIUS is ignored, the locally configured "0" takes precedence.

Example

The following command changes the 802.1X server-timeout to 10 seconds:

```
configure netlogin dot1x timers server-timeout 10
```

History

This command was first available in ExtremeXOS 11.1.

The reauth-max keyword was added in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dynamic-vlan

```
configure netlogin dynamic-vlan [disable | enable]
```

Description

Configures the switch to automatically and dynamically create a *VLAN* after receiving authentication requests from one or more supplicants (clients).

Syntax Description

disable	Specifies that the switch does not automatically create dynamic VLANs. This is the default behavior.
enable	Specifies that the switch automatically create dynamic VLANs.

Default

The default is disabled.

Usage Guidelines

Use this command to configure the switch to dynamically create a VLAN. If configured for dynamic VLAN creation, the switch automatically creates a supplicant VLAN that contains both the supplicant's physical port and one or more uplink ports.

A dynamically created VLAN is only a Layer 2 bridging mechanism; this VLAN does not work with routing protocols to forward traffic. After the switch unauthenticates all of the supplicants from the dynamically created VLAN, the switch deletes that VLAN.

Note
Dynamically created VLANs do not support the session refresh feature of web-based network login because dynamically created VLANs do not have an IP address. Also, dynamic VLANs are not supported on ports when *STP* and network login are both configured on the ports.

By dynamically creating and deleting VLANs, you minimize the number of active VLANs configured on your edge switches. In addition, the *RADIUS* server forwards VSA information to dynamically create the VLAN thereby simplifying switch management. A key difference between dynamically created VLANs and other VLANs is that the switch does not save dynamically created VLANs. Even if you use the save command, the switch does not save a dynamically created VLAN.

Supported Vendor Specific Attributes

To prevent conflicts with existing VLANs on the switch, the RADIUS server uses Vendor Specific Attributes (VSAs) to forward VLAN information, including VLAN ID, to the switch. The following list specifies the supported VSAs for configuring dynamic network login VLANs:

- Extreme: Netlogin-VLAN-ID (VSA 209).
- IETF: Tunnel-Private-Group-ID (VSA 81).
- Extreme: Netlogin-Extended-VLAN (VSA 211).

Note
If the ASCII string only contains numbers, it is interpreted as the VLAN ID. Dynamic VLANs only support numerical VLAN IDs; VLAN names are not supported.

The switch automatically generates the VLAN name in the following format: SYS_NLD_*TAG* where *TAG* specifies the VLAN ID. For example, a dynamic network login VLAN with an ID of 10 has the name SYS_NLD_0010.

Specifying the Uplink Ports

To specify one or more ports as tagged uplink ports that are added to the dynamically created VLAN, use the following command: `configure netlogin dynamic-vlan uplink-ports`

The uplink ports send traffic to and from the supplicants from the core of the network.

By default the setting is none. For more information about this command, see the usage guidelines for `configure netlogin dynamic-vlan uplink-ports`.

Viewing Status Information

To display summary information about all of the VLANs on the switch, including any dynamic VLANs currently operating on the switch, use the following command: `show vlan`

If the switch dynamically creates a VLAN, the VLAN name begins with SYS_NLD_ and the output contains a d flag for the dynamically created VLAN.

To display the status of dynamic VLAN configuration on the switch, use the following command: `show netlogin`

The switch displays the current state of dynamic VLAN creation (enabled or disabled) and the uplink port(s) associated with the dynamic VLAN.

Example

The following example automatically adds ports 1:1-1:2 to the dynamically created VLAN as uplink ports:

```
configure netlogin dynamic-vlan uplink-ports 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin dynamic-vlan uplink-ports

```
configure netlogin dynamic-vlan uplink-ports [port_list | none]
```

Description

Specifies which port(s) are added as tagged, uplink ports to the dynamically created *VLAN*s for network login.

Syntax Description

port_list	Specifies one or more ports to add to the dynamically created VLAN for network login.
none	Specifies that no ports are added. This is the default setting.

Default

The default setting is none.

Usage Guidelines

Use this command to specify which port(s) are used as uplink ports and added to the dynamically created VLAN for network login. The uplink ports send traffic to and from the supplicants from the core of the network.

Uplink ports should not be configured for network login (network login is disabled on uplink ports). If you specify an uplink port with network login enabled, the configuration fails and the switch displays an error message similar to the following:

```
ERROR: The following ports have NetLogin enabled: 1, 2
```

If this occurs, select a port with network login disabled.

Enabling Dynamic Network Login VLANs

To configure the switch to dynamically create a VLAN upon receiving an authentication response, use the following command:

```
configure netlogin dynamic-vlan [disable | enable]
```

By default, the setting is disabled. For more detailed information about this command, see the usage guidelines `configure netlogin dynamic-vlan uplink-ports`.

Viewing Status Information

To display summary information about all of the VLANs on the switch, including any dynamic VLANs currently operating on the switch, use the following command:

```
show vlan
```

If the switch dynamically creates a VLAN, the VLAN name begins with SYS_NLD_ and the output contains a d flag for the dynamically created VLAN.

To display the status of dynamic VLAN configuration on the switch, use the following command:

```
show netlogin
```

The switch displays the current state of dynamic VLAN creation (enabled or disabled) and the uplink port(s) associated with the dynamic VLAN.

Example

The following command configures the switch to add ports 1:1-1:2 to the dynamically created network login VLAN:

```
configure netlogin dynamic-vlan uplink-ports 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin idle-timeout

```
configure netlogin idle-timeout {convergence-endpoint | dot1x | mac |
   web-based} timeout
```

Description

This command clears multiple authentication properties for one or more ports.

Syntax Description

dot1x	IEEE 802.1X Port-based network access control.
mac	MAC authentication.
web-based	Web-based authentication.
convergence-endpoint	Convergence-endpoint authentication.
timeout	Number of seconds before idle timeout (range 0-172800).

Default

Timeout = 300 seconds.

Usage Guidelines

This command appears in `show configuration {module-name} {detail}` for "policy" rather than "netlogin."

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin local-user security-profile

```
configure netlogin local-user user-name security-profile
   security_profile
```

Description

Changes a previously associated security profile.

Syntax Description

user-name	Specifies the name of an existing local network login account.
security_profile	Specifies a security profile string during account creation.

Default

N/A.

Usage Guidelines

Use this command to change any previously associated security profiles on the switch.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin local-user

```
configure netlogin local-user user-name {vlan-vsa [[{tagged | untagged}
   [vlan_name | vlan_tag]] | none]}
```

Description

Configures an existing local network login account.

Syntax Description

user-name	Specifies the name of an existing local network login account.
tagged	Specifies that the client be added as tagged.
untagged	Specifies that the client be added as untagged.
vlan_name	Specifies the name of the destination *VLAN*.
vlan_tag	Specifies the VLAN ID, tag, of the destination VLAN.
none	Specifies that the VSA 211 wildcard (*) is applied, only if you do not specify tagged or untagged.

Default

N/A.

Usage Guidelines

Use this command to modify the attributes of an existing local network login account. You can update the following attributes associated with a local network login account:

- Password of the local network login account.
- Destination VLAN attributes including: adding clients tagged or untagged, the name of the VLAN, and the VLAN ID.

Note

Passwords are case-sensitive and must have a minimum of 1 character and a maximum of 32 characters.

You must create a local network login account before using this command. To create a local network login user name and password, use the following command:

`create netlogin local-user` *`user-name`* `{encrypted} {`*`password`*`} {vlan-vsa [[{tagged | untagged} [`*`vlan_name`*`] | `*`vlan_tag`*`]]} {security-profile`*`security_profile`*`}`

If the switch displays a message similar to the following:

```
* Switch # configure netlogin local-user purplenet
^
%% Invalid input detected at '^' marker.
```

You might be attempting to modify a local network login account that is not present or the switch, or you might have incorrectly entered the account name. To confirm the names of the local network login accounts on your switch, use the following command:

`show netlogin local-users`

Additional Requirements

This command applies only to the web-based and MAC-based modes of network login. 802.1X network login does not support local database authentication.

You must have administrator privileges to use this command. If you do not have administrator privileges, the switch displays a message similar to the following:

```
This user does not have permissions for this command.
```

Passwords are case-sensitive. Passwords must have a minimum of 0 characters and a maximum of 32 characters. If you attempt to create a password with more than 32 characters, the switch displays the following message after you re-enter the password:

```
Password cannot exceed 32 characters
```

Example

This section contains the following examples:

- Updating the password.
- Modifying destination VLAN attributes.

Updating the Password

The following command updates the password of an existing local network login account:

```
configure netlogin local-user megtest
```

After you enter the local network login user name, press [Enter]. The switch prompts you to enter a password; however, the switch does not display the password. At the prompt enter the new password:

```
password:
```

After you enter the new password, press [Enter]. The switch then prompts you to re-enter the password:

```
Reenter password:
```

Updating VLAN Attributes

You can add a destination VLAN, change the destination VLAN, or remove the destination from an existing local network login account. This example changes the destination VLAN for the specified local network login account:

```
configure netlogin local-user megtest vlan-vsa green
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin mac timers reauth-period

```
configure netlogin mac ports [port_list | all] timers [{reauth-period
   [reauth_period]} {reauthentication [on|off]} {delay [delay_period]}]
```

Description

Configures the reauthentication period for network login MAC-based authentication.

Syntax Description

reauth_period	Specifies time after which the switch will attempt to re-authenticate an authenticated supplicant. The range is 0, 30 to 86,400 seconds.
reauthentication	Configure mac reauthentication.
on	MAC reauthentication is enabled.
off	MAC reauthentication is disabled.

delay	Configure MAC authentication delay period.
delay_period	MAC authentication delay period. 0-120 seconds range.

Default

The default is 0 (disabled).

Usage Guidelines

This command allows you to configure the reauth-period for network login MAC-based authentication. The session-timeout configuration on the *RADIUS* server overrides the reauth-period if it has been configured.

In MAC mode, if reauthentication is turned off, globally and per-port, using this command, a session timeout sent by RADIUS takes precedence and local timers are ignored.

Example

The following command configures a MAC authentication delay period of 100 seconds on port 39:

```
configure netlogin mac ports 39 timers delay 100
```

History

This command was first available in ExtremeXOS 12.1.

The **delay** keyword and variable were added in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin mac username case

configure **netlogin mac username case** {**lower** | **upper**}

Description

Sets option to send the Network Login (NetLogin) MAC Authentication MAC address in either uppercase or lowercase for user name or password.

Syntax Description

netlogin	Configures NetLogin specific settings.
mac	Configures NetLogin settings specific to MAC.
username	Configures MAC user name credential attributes.
case	Configures MAC user name case.

lower	Use lowercase (for example: aa:bb:cc:dd:ee:ff).
upper	Use uppercase (for example: AA:BB:CC:DD:EE:FF). Default.

Default

By default, the uppercase is used.

Usage Guidelines

When the user name case is configured as lowercase, if the client with MAC address aa:bb:cc:dd:ee:ff sends a frame, Netlogin MAC sends “aabbccddeeff” (default “None” delimiter) as username and default password for authentication.

Example

The following example sets the NetLogin MAC to be sent in lowercase:

```
# configure netlogin mac username case lower
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin mac username format

```
configure netlogin mac username format [hyphenated | colon-separated |
   none]
```

Description

Configures the NetLogin MAC username format used when sending out for authentication to a RADIUS server.

Syntax Description

mac	Configure Network Login settings specific to MAC.
username	Configure username credential attributes.
format	Configure username format.
hyphenated	Hyphen separator (XX-XX-XX-XX-XX-XX).
colon-separated	Colon separator (XX:XX:XX:XX:XX:XX).
none	No separator (XXXXXXXXXXXX) (This is the default).

Default

No separator is the default.

Example

The following example sets the MAC username format with colon separator:

```
configure netlogin mac username format colon-separated
```

History

This command was first available in ExtremeXOS 12.1.

The **colon-separated** option was added in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin move-fail-action

```
configure netlogin move-fail-action [authenticate | deny]
```

Description

Configures the action network login takes if a *VLAN* move fails. This can occur if two clients attempt to move to an untagged VLAN on the same port.

Syntax Description

authenticate	Specifies that the client is authenticated.
deny	Specifies that the client is not authenticated. This is the default setting.

Default

The default setting is deny.

Usage Guidelines

Use this command to specify how network login behaves if a VLAN move fails. Network login can either authenticate the client on the current VLAN or deny the client.

The following describes the parameters of this command if two clients want to move to a different untagged VLAN on the same port:

- authenticate—Network login authenticates the first client that requests a move and moves that client to the requested VLAN. Network login authenticates the second client but does not move that client to the requested VLAN. The second client moves to the first client's authenticated VLAN.

- deny—Network login authenticates the first client that requests a move and moves that client. Network login does not authenticate the second client.

To view the current move-fail-action setting on the switch, use the `show netlogin` command.

Example

The following command configures network login to authenticate the client on the current VLAN:

```
configure netlogin move-fail-action authenticate
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin port allow egress-traffic

```
configure netlogin ports [port_list | all] allow egress-traffic [none |
   unicast | broadcast | all_cast]
```

Description

Configures the egress traffic in an unauthenticated state.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.
none	Specifies that no traffic is sent out if if no authenticated clients exist on the *VLAN*.
unicast	Specifies that the unicast flooding traffic for the VLANs on the network login enabled port be sent.
broadcast	Specifies that the broadcast traffic for the VLANs on the network login enabled port be sent.
all_cast	Specifies that the broadcast and unicast flooding traffic for the VLANs on the network login enabled port be sent.

Default

The default is none.

Usage Guidelines

This command allows you to configure the egress traffic in an unauthenticated state on a per-port basis.

Enabling ONEPolicy removes the action of this command. This command is supported only in non-policy mode

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin ports

```
configure netlogin ports [all | port_list] [allowed-users allowed_users
   | authentication mode [optional | required] | trap [all-traps | no-
   traps | [{success} {failed} {terminated} {max-reached}]]]
```

Description

Use this command to set the *NetLogin* trap setting for ports.

Syntax Description

all	Configure all ports in the system.
port_list	List of ports to configure.
allowed-users	Number of users allowed per port. Only applicable if the ONEPolicy feature is enabled.
allowed_users	Number of users allowed per port.
authentication mode	Port authentication mode. Only applicable if the ONEPolicy feature is enabled.
optional	Authentication optional. Only applicable if ONEPolicy is enabled.
required	Authentication required. Only applicable if ONEPolicy is enabled.
all-traps	Enable sending all trap types. Only applicable if the ONEPolicy feature is enabled.
no-traps	Disable sending all trap types. Only applicable if the ONEPolicy feature is enabled.
success	Enable sending success trap.
fails	Enable sending failed trap.
terminated	Enable sending terminated trap.
max-reached	Enable sending max number users reached trap. This is applicable in ONEPolicy mode only.

Default

By default, all traps are sent in both ONEPolicy mode and non-ONEPolicy mode.

Usage Guidelines

The following command options are only applicable if ONEPolicy is enabled. They have no effect without ONEPolicy being enabled:

- **authentication mode** [**optional** | **required**]
- **allowed-users** *allowed_users*
- **all-traps** | **no-traps** | [{**success**} {**failed**} {**terminated**} {**max-reached**}]

This command appears in `show configuration {module-name} {detail}` for "policy" and "netlogin."

The **no-traps** configuration is retained after save and reboot.

Trap configurations after applying **no-traps** are appended until **no-traps** is configured again (for example: **no-traps** configuration followed by **success**, and then**terminated** traps, sends success and terminated traps:

```
# configure netlogin ports 1 trap no-traps
# show configuration "policy"
   **no traps commands appear due to no-traps being configured
# configure netlogin ports 1 trap success
# show configuration "policy"
# Module policy configuration.
# configure netlogin ports 1 trap success
   **success traps command appears
# configure netlogin ports 1 trap terminated
# show configuration "policy"
# Module policy configuration.
# configure netlogin ports 1 trap success
# configure netlogin ports 1 trap terminated
   **success and terminated traps commands appear
```

Example

This example shows how to enable all NetLogin port trap setting:

```
configure netlogin trap port 1:1 all
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin ports mode

```
configure netlogin ports [all | port_list] mode [mac-based-vlans | port-
   based-vlans]
```

Description

Configures the network login port's mode of operation.

Syntax Description

all	Specifies all netlogin ports.
port_list	Specifies one or more network login ports.
mac-based-vlans	Allows more than one untagged *VLAN*.
port-based-vlans	Allows only one untagged VLAN. This is the default behavior.

Default

The default setting is **port-based-vlans**.

Usage Guidelines

Use this command to configure network login MAC-based VLANs on a network login port.

If you modify the mode of operation to mac-based-vlans and later disable all network login protocols on that port, the mode of operation automatically returns to port-based-vlans.

When you change the network login port's mode of operation, the switch deletes all currently known supplicants from the port and restores all VLANs associated with that port to their original state. In addition, by selecting mac-based-vlans, you are unable to manually add or delete untagged VLANs from this port. Network login now controls these VLANs.

With network login MAC-based operation, every authenticated client has an additional *FDB* flag that indicates a translation MAC address. If the supplicant's requested VLAN does not exist on the port, the switch adds the requested VLAN.

Configuration of **port-based-vlans** is lost if ONEPolicy is enabled.

Important Rules and Restrictions

This section summarizes the rules and restrictions for configuring network login MAC-based VLANs:

- If you attempt to configure the port's mode of operation before enabling network login, the switch displays an error message similar to the following:
  ```
  ERROR: The following ports do not have NetLogin enabled; 1
  ```

  To enable network login on the switch, use the following command to enable network login and to specify an authentication method (for example, 802.1X—identified as dot1.x in the CLI):

`enable netlogin` dot1x

To enable network login on the ports, use the following command to enable network login and to specify an authentication method (for example, 802.1X—identified as dot1.x in the CLI):

`enable netlogin ports` 1:1 dot1x

- On ExtremeXOS versions prior to 12.0 on switches other than the ExtremeSwitching series switches, 10 Gigabit Ethernet ports such as those on the uplink ports on the switches do not support network login MAC-based VLANs.

  If you attempt to configure network login MAC-based VLANs on 10 Gigabit Ethernet ports, the switch displays an error message similar to the following:

  ```
  ERROR: The following ports do not support the MAC-Based VLAN mode; 1, 2, 10
  ```

- You can have a maximum of 1,024 MAC addresses per ExtremeSwitching switch.

Displaying FDB Information

To view network login-related FDB entries, use the following command:

```
show fdb netlogin [all | mac-based-vlans]
```

The following is sample output from the show fdb netlogin mac-based-vlans command:

```
Mac                   Vlan          Age     Use    Flags      Port List
-------------------------------------------------------------------------
00:04:96:10:51:80     VLONE(0021)   0086    0000   n m      v 1:11
00:04:96:10:51:81     VLTWO(0051)   0100    0000   n m      v 1:11
00:04:96:10:51:91     VLTWO(0051)   0100    0000   n m      v 1:11
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, M - Mirror, B - Egress Blackhole,
b - Ingress Blackhole, v - NetLogin MAC-Based VLAN.
```

The flags associated with network login include:

- v—Indicates the FDB entry was added because the port is part of a MAC-based virtual port/VLAN combination.
- n—Indicates the FDB entry was added by network login.

Displaying Port and VLAN Information

To view information about the VLANs that are temporarily added in MAC-based mode for network login, use the following command:

`show ports` *`port_list`* `information detail`

The following is sample output from this command:

```
Port:   1
Virtual-router: VR-Default
Type:           UTP
Random Early drop:      Disabled
Admin state:    Enabled with  auto-speed sensing  auto-duplex
Link State:     Active, 100Mbps, full-duplex
Link Counter: Up        1 time(s)
VLAN cfg:
```

```
Name: Default, Internal Tag = 1(MAC-Based), MAC-limit = No-limit
...<truncated output>
Egress 802.1p Replacement:      Disabled
NetLogin:                       Enabled
NetLogin authentication mode:   Mac based
NetLogin port mode:             MAC based VLANs
Smart redundancy:               Enabled
Software redundant port:        Disabled
auto-polarity:                  Enabled
```

The added output displays information about the mode of operation for the network login port.

- VLAN cfg—The term MAC-based appears next to the tag number.
- *NetLogin* port mode—This output was added to display the port mode of operation. Mac based appears as the network login port mode of operation.

To view information about the ports that are temporarily added in MAC-based mode for network login, due to discovered MAC addresses, use the following command:

```
show vlan detail
```

The following is sample output from this command:

```
VLAN Interface with name Default created by user
Tagging:        802.1Q Tag 1
Priority:       802.1P Priority 0
Virtual router: VR-Default
STPD:           s0(Disabled,Auto-bind)
Protocol:       Match all unfiltered protocols
Loopback:       Disable
NetLogin:       Disabled
Rate Shape:     Disabled
QosProfile:     None configured
Ports:   26.      (Number of active ports=2)
Untag:    *1um, *2,     3,     4,     5,     6,     7,
8,        9,    10,    11,    12,    13,    14,
15,       16,    17,    18,    19,    20,    21,
22,       23,    24,    25,    26
Flags: (*) Active, (!) Disabled, (g) Load Sharing port
(b) Port blocked on the vlan, (a) Authenticated NetLogin Port
(u) Unauthenticated NetLogin port, (m) Mac-Based port
```

The flags associated with network login include:

- a—Indicates an authenticated network login port.
- u—Indicates an unauthenticated network login port.
- m—Indicates that the network login port operates in MAC-based mode.

Example

The following command configures the network login ports mode of operation:

```
configure netlogin ports 1:1-1:10 mode mac-based-vlans
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin ports no-restart

```
configure netlogin ports [all | port_list] no-restart
```

Description

Disables the network login port restart feature.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.

Default

The default setting is no-restart; the network login port restart feature is disabled.

Usage Guidelines

Use this command to disable the network login port restart feature on a network login port.

Configure network login port restart on ports with directly attached supplicants. If you use a hub to connect multiple supplicants, only the last unauthenticated supplicant causes the port to restart.

Enabling ONEPolicy removes the action of this command. This command is supported only in non-policy mode

Displaying the Port Restart Configuration

To display the network login settings on the port, including the configuration for port restart, use the following command:

```
show netlogin port port_list
```

Output from this command includes the enable/disable state for network login port restart.

Example

The following command disables network login port restart on port 1:1:

```
configure netlogin ports 1:1 no-restart
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin ports restart

```
configure netlogin ports [all | port_list] restart
```

Description

Enables the network login port restart feature.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.

Default

The default setting is no-restart; the network login port restart feature is disabled.

Usage Guidelines

Use this command to enable the network login port restart feature on a network login port. This allows network login to restart specific network login-enabled ports when the last authenticated supplicant releases, regardless of the configured protocols on the port.

Configure network login port restart on ports with directly attached supplicants. If you use a hub to connect multiple supplicants, only the last unauthenticated supplicant causes the port to restart.

Enabling ONEPolicy removes the action of this command. This command is supported only in non-policy mode

Displaying the Port Restart Configuration

To display the network login settings on the port, including the configuration for port restart, use the following command:

```
show netlogin port port_list
```

Output from this command includes the enable/disable state for network login port restart.

Example

The following command enables network login port restart on port 1:1:

```
configure netlogin ports 1:1 restart
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin redirect-page

```
configure netlogin redirect-page url
```

Description

Configures the redirect URL for Network Login.

Syntax Description

url	Specifies the redirect URL for Network Login.

Default

The redirect URL default value is “http://www.extremenetworks.com”; the default port value is 80.

Usage Guidelines

In ISP mode, you can configure network login to be redirected to a base page after successful login using this command. If a *RADIUS* server is used for authentication, then base page redirection configured on the RADIUS server takes priority over this configuration.

You must configure a complete URL starting with http:// or https://

You can also configure a specific port location at a specific target URL location. For example, you can configure a target port 8080 at extremenetworks.com with the following command:

```
configure netlogin redirect-page "www.extremenetworks.com:8080"
```

This command applies only to the web-based authentication mode of Network Login.

Example

The following command configures the redirect URL as http://www.extremenetworks.com/support:

```
configure netlogin redirect-page http://www.extremenetworks.com/support
```

History

This command was first available in ExtremeXOS 11.1.

Support for HTTPS was introduced in ExtremeXOS 11.2.

Target port support was introduced in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin session-refresh

```
configure netlogin session-refresh {refresh_seconds}
```

Description

Configures network login session refresh.

Syntax Description

refresh_seconds	Specifies the session refresh time for network login in seconds.

Default

Enabled, with a value of 180 seconds for session refresh.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the Logout link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to 360 seconds by default. The value can range from 1 to 3600 seconds. When you configure the network login session refresh for the logout window, ensure that the *FDB* aging timer is greater than the network login session refresh timer.

This command applies only to the web-based authentication mode of network login.

Example

The following command enables network login session refresh and sets the refresh time to 100 seconds:

```
configure netlogin session-refresh 100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin session-timeout

```
configure netlogin session-timeout {dot1x | mac | web-based |
   convergence-endpoint} timeout
```

Description

Use this command to set the maximum number of seconds an authenticated session may last before termination of the session.

Syntax Description

dot1x	IEEE 802.1X Port-based network access control.
mac	MAC authentication.
web-based	Web-based authentication.
convergence-endpoint	Convergence-endpoint authentication.
timeout	Number of seconds before session timeout (range 0-172800).

Default

0 seconds.

Usage Guidelines

A value of zero may be superseded by a session timeout value provided by the authenticating server. For example, if a session is authenticated by a *RADIUS* server, that server may encode a session-timeout attribute in its authentication response.

The specifications from this command appear in `show configuration {module-name} {detail}` for "policy" and "netlogin."

If you want to scale to 65,000 authenticated users, use a session timeout value of at least 300 minutes.

Example

The following example shows how to set the session-timeout value for an active session, for mac authentication to 500 seconds:

```
configure netlogin session-timeout mac 500
```

History

This command was first available in ExtremeXOS 16.1.

The **convergence-endpoint** option was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin trap

```
configure netlogin trap max-users [enable | disable]
```

Description

Use this command to set the *NetLogin* system traps.

Syntax Description

enable	Enable sending traps when max users reached in system
disable	Disable sending traps when max users reached in system

Default

Disabled.

Usage Guidelines

The specifications from this command appear in `show configuration {module-name} {detail}` for "policy" and "netlogin."

Example

This example shows how to enable the NetLogin maximum users trap setting:

```
configure netlogin trap max-users enabled
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure netlogin vlan

```
configure netlogin vlan vlan_name
```

Description

Configures the *VLAN* for Network Login.

Syntax Description

vlan	Specifies the VLAN for Network Login.

Default

N/A.

Usage Guidelines

This command will configure the VLAN used for unauthenticated clients. One VLAN needs to be configured per VR. To change the VLAN, network login needs to be disabled. Network login can only be enabled when a VLAN is assigned (and no ports are configured for it).

By default no VLAN is assigned for network login.

Example

The following command configures the VLAN login as the network login VLAN:

```
configure netlogin vlan login
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure network-clock gptp bmca

```
configure network-clock gptp bmca [ on | off ]
```

Description

This command configures the Best Master Clock Algorithm (BMCA) as part of gPTP.

Syntax Description

network-clock	Network Clock
gptp	IEEE 802.1AS Generalized Precision Time Protocol
bmca	Best Master Clock Algorithm
on	Use BMCA to dynamically port roles.
off	Disable BMCA and statically set port roles.

Default

On.

Usage Guidelines

Use this command to configure the BMCA as part of gPTP.

Example

The following example displays output from the show command with BMCA.

```
# show network-clock gptp
gPTP status         : Enabled
BMCA                : [On | Off]
Static slave port   : 5 (used when BMCA Off)
--or--
Static slave port   : None (used when BMCA Off)
gPTP enabled ports  : *1m     *21d    *22d    *47d
Flags:         (*) Active,  (!) Administratively disabled,
               (d) Disabled gPTP port role, (m) Master gPTP port role,
               (p) Passive gPTP port role,  (s) Slave gPTP port role
```

History

This command was first available in ExtremeXOS 15.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure network-clock gptp default-set

```
configure network-clock gptp default-set [{priority1 priority1_value}
   {priority2 priority2_value}]
```

Description

This command configures the switch's default-set parameters, specifically its grandmaster clock priority values that are used to elect the grandmaster clock in the network.

Syntax Description

priority1_value	The switch's grandmaster clock priority1 value. This is the most significant parameter used to select the grandmaster clock in the network. Lower values indicate higher priority, and 255 prevents the switch from becoming the grandmaster clock.
priority2_value	The switch's grandmaster clock priority2 value. This is one of the least significant parameters used to select the grandmaster clock in the network. Lower values indicate higher priority.

Default

- Priority1_value = 246 (from 802.1AS 8.6.2.1)
- Priority2_value = 248 (from 802.1AS 8.6.2.5)

Usage Guidelines

Use this command to configure the switch's default-set parameters, specifically its grandmaster clock priority values that are used to elect the grandmaster clock in the network. The Best Master Clock Algorithm uses six parameters from each time-aware system in the network to select the grandmaster clock in the network. Priority1 is the highest precedence value; it allows users to preemptively configure which systems they prefer to be the grandmaster clock. Priority2 is a lower precedence value; it allows users to configure tiebreaker priorities.

The default priority1 values defined by IEEE 802.1AS-2011 clause 8.6.2.1 give preference to network infrastructure systems such as Extreme switches.

Example

```
configure network-clock gptp default-set priority1 248
configure network-clock gptp default-set priority2 100
configure network-clock gptp default-set priority1 248 priority2 100
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure network-clock gptp ports announce

```
configure network-clock gptp ports [port_list {only} | all] announce
   [initial-interval log_2_interval | receipt-timeout timeout_count]
```

Description

Configures gPTP Announce parameters on the specified ports. Announce messages are used to elect the grandmaster clock and determine the time-synchronous spanning tree.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
only	Apply change only to specified port, even if port is master of a load sharing group.
all	Specifies all of the switch's physical ports.

log_2_interval	The interval between Announce messages used by the switch on the port when the port is initialized or when the switch receives a message interval request TLV with announceInterval value 126. This value is in log 2 seconds. The valid range of values is -3 (2^{-3} = 0.125 seconds) to 17 (2^{17} = 131072 seconds).
timeout_count	On a gPTP slave port, the number of announce intervals to wait without receiving an Announce message before assuming the master is no longer sending Announce messages.

Default

- log_2_interval = 0 (1 second; 802.1AS-2011 10.6.2.2)
- timeout_count = 3 (802.1AS-2011 10.6.3.2)

Usage Guidelines

Use this command to configure gPTP Announce parameters on the specified ports. Announce messages are used to elect the grandmaster clock and determine the time-synchronous spanning tree. Announce selects the grandmaster in the network and establishes the tree from the grandmaster to all other time-aware systems in the network.

initial-interval corresponds to 802.1AS parameter `initialLogAnnounceInterval`.

receipt-timeout corresponds to 802.1AS parameter `announceReceiptTimeout`.

Example

```
# configure network-clock gptp ports 1-2 announce initial-interval 127
# configure network-clock gptp ports all announce receipt-timeout 5
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure network-clock gptp ports peer-delay

```
configure network-clock gptp ports [port_list {only} | all] peer-
   delay [{allowed-lost-responses lost_responses_value} {initial-req-
   interval log_2_interval} {[asymmetr asymmetry_time [nanoseconds |
   microseconds | milliseconds | seconds] | neighbor-thresh [auto |
```

neighbor_thresh_time [**nanoseconds** | **microseconds** | **milliseconds** | **seconds**]]}{**correction-field fractional-ns-only** *on_off*}]

Description

Configures gPTP peer delay parameters on the specified ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
only	Apply change only to specified port, even if port is master of a load sharing group.
all	Specifies all of the switch's physical ports.
lost_responses_value	The number of consecutive Peer Delay RequestPdelay_Req messages that the switch must send on a port without receiving a valid response before it considers the port not to be exchanging Peer Delay messages with its neighbor.
log_2_interval	The interval between Peer Delay RequestPdelay_Req messages sent by the switch on the port when the port is initialized or when the switch receives on the port a message interval request TLV with linkDelayInterval value of 126. This value is in log2 seconds. The valid range of values is -3 (2-3 = 0.125 seconds) to 17 (217 = 131072 seconds).
asymmetry_time	The time that the propagation delay from this switch to the neighbor is less than the estimated one-way propagation delay between the switch and its neighbor (which is also the time that the propagation delay from the neighbor to this switch is greater than the estimate). This value is negative if the propagation delay to the neighbor is greater than the estimate. It can be in nanoseconds, microseconds, milliseconds, or seconds. The maximum value is 4,294,967,295 nanoseconds (approximately 4.3 seconds). Let tIR be the propagation delay from this switch (initiator) to the neighbor (responder), tRI be the propagation delay from the neighbor to this switch, and meanPathDelay be the estimated one-way propagation delay. Then: • meanPathDelay = (tIR + tRI) / 2 • tIR = meanPathDelay – asymmetry_time • tRI = meanPathDelay + asymmetry_time
neighbor_thresh_time	The maximum measured mean of the propagation delay between this switch and the neighbor above which the switch considers the port unable to run gPTP. This value can be in nanoseconds, microseconds, milliseconds, or seconds.

auto	Use a media specific default value for the neighbor_thresh_time: • Copper: 800 nanoseconds. This category includes short range copper cables such as SFP+ Direct Attach and QSRP+ Passive Copper. • Multi-mode fiber: 11 microseconds. This category includes the QSFP+ Active Optical cables. 11 microseconds allows 10 microseconds for 100BASE-FX 2 km plus 10% tolerance.) • Single-mode fiber: 550 microseconds. This allows 500 microseconds for our "LX100" transceiver plus 10% tolerance. Note: These values may change. A draft of the 802.1AS corrigendum (P802.1AS-Cor-1/D1.1) specifies 800 ns for 100BASE-TX and 1000BASE-T.
correction-field	Specifies configuring the correction field of peer delay messages.
fractional-ns-only	Specifies considering only the fractional nano-second portion for peer delay calculations.
on_off	Consider only fractional nano-second portion, on or off. Default is off.

Default

- Lost_responses_value = 3 (802.1AS 11.5.3)
- Log_2_interval = 0 (1 second; not specified in 802.1AS)
- Asymmetry_time = 0 (802.1AS 10.2.4.8)
- Neighbor_thresh_time = Copper media: 800 nanoseconds, fiber media: 4,294,967,295 nanoseconds
- Considering only the fractional nano-second portion of correction field of peer delay messages if off.

Usage Guidelines

Peer Delay messages determine whether a neighboring system is gPTP capable and measure the propagation delay on the link between the switch and a neighboring gPTP capable system.

- **allowed-lost-responses** corresponds to 802.1AS parameter `allowedLostResponses`.
- **initial-req-interval** corresponds to 802.1AS parameter `initialLogPdelayReqInterval`.
- **asymmetry** corresponds to 802.1AS parameter `delayAsymmetry`.
- **neighbor-thresh** corresponds to 802.1AS parameter `neighborPropDelayThresh`.

Example

```
configure network-clock gptp ports 1-3 peer-delay allowed-lost-responses 5
configure network-clock gptp ports 1-2 peer-delay initial-log-interval -3
configure network-clock gptp ports 1-2 peer-delay neighbor-thresh 3 nanoseconds
```

History

This command was first available in ExtremeXOS 15.3.

Options to control whether or not you consider only the fractional nano-second portion of correction field of peer delay messages was added in ExtremeXOS 31.1.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure network-clock gptp ports sync

```
configure network-clock gptp ports [port_list {only} | all] sync
   [initial-interval log_2_interval receipt-timeout timeout_count]
```

Description

Configures gPTP synchronization parameters on the specified ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
only	Apply change only to specified port, even if port is master of a load sharing group.
all	Specifies all of the switch's physical ports.
log_2_interval	The interval between Sync messages used by the switch for the port when the port is initialized or when the switch receives a message interval request TLV with timeSyncInterval value of 126. This value is in log2 seconds. The valid range of values is -3 (2-3 = 0.125 seconds) to 17 (217 = 131072 seconds).
timeout_count	On a gPTP slave port, the number of sync intervals to wait without receiving a Sync message before assuming the adjacent master port is no longer sending Sync messages.

Default

- log_2_interval = -3 (0.125 second; 802.1AS 11.5.2.3)
- timeout_count = 3 (802.1AS 10.6.3.1)

Usage Guidelines

Synchronization distributes the time from the grandmaster to all other time-aware systems in the networks.

initial-interval corresponds to 802.1AS parameter `initialLogSyncInterval`.

receipt-timeout corresponds to 802.1AS parameter `syncReceiptTimeout`.

Example

```
configure network-clock gptp ports 1-2 sync initial-interval -1
configure network-clock gptp ports all sync receipt-timeout 5
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure network-clock gptp slave-port

`configure network-clock gptp slave-port [ port_no | none ]`

Description

This command allows to you configure the port that will be the slave-port when BMCA is off. All other enabled network gPTP ports will be master ports.

Syntax Description

network-clock	Network Clock
gptp	Variable description, available options, and notes.
slave-port	Configure slave port when Best Master Clock Algorithm is off.
port_no	Port Number of slave port
none	This switch is the Grand Master Clock (GMC).

Default

N/A.

Usage Guidelines

Use this command to you configure the port that will be the slave-port when BMCA is off. All other enabled network gPTP ports will be master ports.

Example

The following example shows the output of the `show network-clock gptp` command with BMCA.

```
gPTP status         : Enabled
```

```
BMCA                : [On | Off]
Static slave port   : 5 (used when BMCA Off)
--or--
Static slave port   : None (used when BMCA Off)
gPTP enabled ports  : *1m     *21d    *22d    *47d
Flags:         (*) Active,  (!) Administratively disabled,
               (d) Disabled gPTP port role, (m) Master gPTP port role,
               (p) Passive gPTP port role,  (s) Slave gPTP port role
```

History

This command was first available in ExtremeXOS 15.7.

Platform Availability

This command is available on platforms that support the AVB feature pack license and have it installed. For complete information about software licensing, including how to obtain and upgrade your license, and which platforms support the AVB feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure nodealias ports

`configure` **`nodealias ports`** [*port_list* |**all**] **`maxentries`** *entries*

Description

This command modifies the per-port maximum number of alias entries in the Node Alias database. Node Alias discovers information about the end systems on a per-port basis. Information from packets from end systems, such as VLANID, source MAC address, source IP address, protocol, etc. are captured in a database that can be queried.

Syntax Description

nodealias	Node Alias feature that maps source IP address, MAC address, host name, and protocol on a per port basis.
ports	Designates that specified ports should have the specified maximum number of alias entries applied.
port_list	Lists the ports to apply the specified maximum number of alias entries to. Designated as a port list separated by comma (,) or dash (-).
all	Specifies that all ports have the specified maximum number of alias entries.
maxentries	Designates a maximum number of alias entries per port.
entries	The value for the maximum number of aliases entries. The default is 8,192 divided evenly by the number of ports in the switch.

Default

If no value is specified for the maximum number of alias entries, the default is 8,192 divided evenly by the number of ports in the switch.

Usage Guidelines

The per-port limit can be set up to 8,192 for all switch ports. For example, if the switch has 32 ports, you can configure the maximum limit as 32 × 8,192. However, the switch can only hold a maximum of 8,192 alias entries per slot.

As a result of snooping one frame, the Node Alias feature may create additional entries to facilitate the searching based on finer details, such as protocol type. For example, when a *BGP* frame is received, two entries are created: one entry with protocol type IP, and another entry with protocol type BGP.

If you change the maximum alias entries to a value that is less than the number entries in the database, the more recent entries are retained.

Example

The following example specifies a maximum of 100 alias entries on all ports:

```
configure nodealias ports all maxentries 100
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp key trusted/not-trusted

`configure ntp key` *keyid* [**trusted** | **not-trusted**]

Description

Specifies whether an NTP key is trusted or not trusted.

Syntax Description

keyid	Specifies the key ID as a value from 1 to 65534.
trusted	Specifies that the key is in trusted status. To use a specific key for an NTP session, set the key to trusted status.
not-trusted	Specifies that the key is in not trusted status.

Default

An NTP key is not trusted by default.

Usage Guidelines

After an NTP key is created, the generated key is not-trusted by default. To use a specific key for an NTP session, the key must be trusted. The trusted option changes the key to trusted status. The not-trusted option changes the key to untrusted status.

Example

The following command changes NTP key 1 to trusted status:

```
configure ntp key 1 trusted
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp local-clock none

```
configure ntp local-clock none
```

Description

Removes the internal local clock from the clock source list.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command removes the internal local clock from the clock source list:

```
configure ntp local-clock none
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp local-clock stratum

```
configure ntp local-clock stratum stratum_number
```

Description

Configures the internal local clock with a stratum number. The stratum number defines the distance from the reference clock. The lower the number, the closer the switch is to the reference clock.

Syntax Description

stratum_number	Specifies the distance from the reference clock from 2 through 16, with 2 being closest and 16 being the farthest away.

Default

The local clock is disabled by default.

Usage Guidelines

The internal local clock is configured as a clock source with a given stratum number. Because the local clock is not as reliable as an external clock source with GPS or CDMA, the stratum number should be higher than the stratum number of the external clock source to allow the system to acquire the most reliable clock information from the clock source lists.

Example

The following command configures the local clock with a stratum number of 3:

```
configure ntp local-clock stratum 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp restrict-list

```
configure ntp restrict-list [add | delete] network {mask} [permit |
   deny] {{vr} vr_name}
```

Description

Restricts a host or block of client IP addresses from getting NTP service. When NTP is enabled over a *VLAN*, an NTP server is configured, or a broadcast NTP server is in a VLAN, the VLAN's IP block or NTP server's IP address is automatically added into the system with a permit action.

Syntax Description

add	Restricts a client from getting NTP service.
delete	Removes a client from the restrict list.
network	Specifies a host or block of IP addresses.
mask	Specifies the subnet mask of the network.
permit	Specifies that a particular block of client IP addresses is permitted to get NTP service.
deny	Specifies that a particular block of client IP addresses is denied NTP service.
vr	Specifies VRs for NTP service.
vr_name	Specifies the VR name for allowing/denying NTP service. If no VR name is specified, the current command context is used.

Default

All addresses are denied by default.

If no VR name is specified, the current command context is used.

Usage Guidelines

N/A.

Example

The following command restricts a block of client IP addresses from getting NTP service:

```
configure ntp restrict-list add 132.25.82.3 deny
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** keyword was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp server/peer add

```
configure ntp [server | peer] add [ip_address | host_name] {key keyid}
   {option [burst | initial-burst]} {{vr} vr_name}
```

Description

Configures an NTP server or peer.

Syntax Description

ip_address	Specifies the IP address of the NTP server or peer.
host_name	Specifies the host name of the NTP server or peer.
keyid	Specifies the key ID as a value from 1 to 65534.
burst	Follows the same burst mechanism when an NTP server is reachable.
initial-burst	Allows the system to send six burst packets when an NTP server becomes unreachable (discovered but unreachable).
vr	Specifies VR.
vr_name	Specifies the VR name. If no VR name is specified, the current command context is used.

Default

If no VR name is specified, the current command context is used.

Usage Guidelines

The initial-burst option is useful when a fast time synchronization is required at the initial stage.

Example

The following command adds an NTP server named “Missouri” with key 5 and an initial burst:

```
configure ntp server add Missouri key 5 initial-burst
```

History

This command was first available in ExtremeXOS 12.7.

The **vr** keyword was added in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ntp server/peer delete

```
configure ntp [server | peer] delete [ip_address | host_name]
```

Description

Removes an NTP server or peer from external clock source lists.

Syntax Description

ip-address	Specifies the IP address of the NTP server or peer.
host_name	Specifies the host name of the NTP server or peer.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command removes an NTP peer Missouri from external clock source lists

```
configure npt peer delete Missouri
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospf bfd

```
configure ospf vlan vlan-name bfd on | off
```

Description

Configures BFD for OSPFv2.

Syntax Description

bfd	Bidirectional forwarding detection.
on	Turn on BFD for *OSPF* interface.
off	Turn off BFD for OSPF interface.

Default

Off.

Usage Guidelines

Use this command to turn BFD protection on or off on a specific OSPF interface.

The following example configures BFD protection on for *VLAN* 1:

Example

```
configure ospf vlan1 bfd on
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospf add virtual-link

`configure ospf add virtual-link` *`router-identifier area-identifier`*

Description

Adds a virtual link connected to another ABR.

Syntax Description

`router-identifier`	Specifies the router ID of the other end of the link.
`area-identifier`	Specifies an *OSPF* area.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- router-identifier—Far-end router interface number.
- area-identifier—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command configures a virtual link between the two interfaces:

```
configure ospf add virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf add vlan area

```
configure ospf add vlan [vlan-name | all] area area-identifier {passive}
```

Description

Enables *OSPF* on one or all *VLAN*s (router interfaces).

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
area-identifier	Specifies the area to which the VLAN is assigned.
passive	Specifies to stop sending and receiving hello packets on this interface.

Default

Disabled.

Usage Guidelines

Not applicable.

Example

The following command enables OSPF on a VLAN named accounting:

```
configure ospf add vlan accounting area 0.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf add vlan area link-type

```
configure ospf add vlan vlan-name area area-identifier link-type [auto |
   broadcast | point-to-point] {passive}
```

Description

Configures the *OSPF* link type.

Syntax Description

vlan-name	Specifies a *VLAN* name.
area-identifier	Specifies the area to which the VLAN is assigned.
auto	Specifies to automatically determine the OSPF link type based on the interface type.
broadcast	Specifies a broadcast link, such as Ethernet. Routers must elect a DR and a BDR during synchronization.
point-to-point	Specifies a point-to-point link type, such as PPP.
passive	Specifies to stop sending and receiving packets on this interface.

Default

Auto.

Usage Guidelines

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Example

The following command configures the OSPF link type as automatic on a VLAN named accounting:

```
configure ospf add vlan accounting area 0.0.0.1 link-type auto
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area add range

```
configure ospf area area-identifier add range [ip-address ip-mask |
   ipNetmask] [advertise | noadvertise] [type-3 | type-7]
```

Description

Configures a range of IP addresses in an *OSPF* area to be aggregated.

Syntax Description

area-identifier	Specifies an OSPF area.
ip-address	Specifies an IP address
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
advertise	Specifies to advertise the aggregated range of IP addresses.
noadvertise	Specifies not to advertise the aggregated range of IP addresses.
type-3	Specifies type 3 LSA, summary LSA.
type-7	Specifies type 7 LSA, NSSA external LSA.

Default

N/A.

Usage Guidelines

If advertised, the aggregated IP range is exported as a single LSA by the ABR.

Example

The following command is used to summarize a certain range of IP addresses within an area and export them out as a single address:

```
configure ospf area 1.2.3.4 add range 10.1.2.0/24 advertise type-3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area delete range

```
configure ospf area area-identifier delete range [ip-address ip-mask |
   ipNetmask]
```

Description

Deletes a range of aggregated IP addresses in an *OSPF* area.

Syntax Description

area-identifier	Specifies an OSPF area.
ip-address	Specifies an IP address.
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command deletes an aggregated IP address range:

```
configure ospf area 1.2.3.4 delete range 10.1.2.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area external-filter

```
configure ospf area area-identifier external-filter [policy-map |none]
```

Description

Configures an external filter policy.

Syntax Description

area-identifier	Specifies the *OSPF* target area.
policy-map	Specifies a policy.
none	Specifies not to apply an external filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPF areas (an ABR function), a policy can be applied to an OSPF area that filters a set of OSPF external routes from being advertised into that area.

Using the none mode specifies that no external filter is applied.

Example

The following command configures an external filter policy, nosales:

```
configure ospf area 1.2.3.4 external-filter nosales
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area interarea-filter

```
configure ospf area area-identifier interarea-filter [policy-map | none]
```

Description

Configures a global inter-area filter policy.

Syntax Description

area-identifier	Specifies the *OSPF* target area.
policy-map	Specifies a policy.
none	Specifies not to apply an interarea filter.

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPF areas (an ABR function), a policy can be applied to an OSPF area that filters a set of OSPF inter-area routes from being sourced from any other areas.

Example

The following command configures an inter-area filter policy, nosales:

```
configure ospf area 0.0.0.6 interarea-filter nosales
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area normal

```
configure ospf area area-identifier normal
```

Description

Configures an OSFP area as a normal area.

Syntax Description

area-identifier	Specifies an *OSPF* area.

Default

Normal.

Usage Guidelines

A normal area is an area that is not any of the following:

- Stub area.
- NSSA.

Virtual links can be configured through normal areas. External routes can be distributed into normal areas.

Example

The following command configures an OSPF area as a normal area:

```
configure ospf area 10.1.0.0 normal
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area nssa stub-default-cost

```
configure ospf area area-identifier nssa [summary | nosummary] stub-
   default-cost cost {translate}
```

Description

Configures an *OSPF* area as an NSSA.

Syntax Description

area-identifier	Specifies an OSPF area.
summary	Specifies that type-3 can be propagated into the area.
nosummary	Specifies that type-3 cannot be propagated into the area.
cost	Specifies a cost metric.
translate	Specifies whether type-7 LSAs are translated into type-5 LSAs.

Default

N/A.

Usage Guidelines

NSSAs are similar to the existing OSPF stub area configuration option, but have the following two additional capabilities:

- External routes originating from an ASBR connected to the NSSA can be advertised within the NSSA.
- External routes originating from the NSSA can be propagated to other areas, including the backbone area, if translated to type 5 LSAs.

When configuring an OSPF area as an NSSA, the translate option should only be used on NSSA border routers, where translation is to be enforced. If translate is not used on any NSSA border router in a NSSA, one of the ABRs for that NSSA is elected to perform translation (as indicated in the NSSA specification). The option should not be used on NSSA internal routers. Doing so inhibits correct operation of the election algorithm.

Example

The following command configures an OSPF area as an NSSA:

```
configure ospf area 10.1.1.0 nssa summary stub-default-cost 10 translate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area stub stub-default-cost

```
configure ospf area area-identifier stub [summary | nosummary] stub-
   default-cost cost
```

Description

Configures an *OSPF* area as a stub area.

Syntax Description

area-identifier	Specifies an OSPF area.
summary	Specifies that type-3 can be propagated into the area.
nosummary	Specifies that type-3 cannot be propagated into the area.
cost	Specifies a cost metric.

Default

N/A.

Usage Guidelines

A stub area is connected to only one other area. The area that connects to a stub area can be the backbone area. External route information is not distributed into stub areas. Stub areas are used to reduce memory and computation requirements on OSPF routers.

Example

The following command configures an OSPF area as a stub area:

```
configure ospf area 0.0.0.6 stub nosummary stub-default-cost 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf area timer

```
configure ospf area area-identifier timer retransmit-interval transit-
   delay hello-interval dead-interval {wait-timer-interval}
```

Description

Configures the timers for all interfaces in the same *OSPF* area.

Syntax Description

area-identifier	Specifies an OSPF area.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1–3,600 seconds.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1–3,600 seconds.
hello-interval	Specifies the interval at which routers send hello packets. The range is 1–65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1–2,147,483,647 seconds.
wait-timer-interval	Specifies the interval between the interface coming up and the election of the DR and BDR. Usually equal to the dead timer interval.

Default

- *retransmit interval*—Default: 5
- *transit delay*—Default: 1
- *hello interval*—Default: 10
- *dead interval*—Default: 40
- *wait timer interval*—Default: dead interval

Usage Guidelines

Configuring OSPF timers on a per-area basis is a shorthand for applying the timers and authentication to each *VLAN* in the area at the time of configuration. If you add more VLANs to the area, you must configure the timers and authentication for the new VLANs explicitly.

Specify the following:

- *retransmit interval*—If you set an interval that is too short, unnecessary retransmissions will result.
- *transit delay*—The transit delay must be 1 second or greater.
- *hello interval*—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- *dead interval*—This interval should be a multiple of the hello interval.
- *wait timer interval*—This interval is required by the OSPF standard to be equal to the router dead interval. Under some circumstances, setting the wait interval to smaller values can help OSPF routers on a broadcast network to synchronize more quickly at the expense of possibly electing an incorrect DR or BDR. This value should not be set to less than the hello interval. The default value is equal to the router dead interval.

Example

The following command sets the timers in area 0.0.0.2:

```
# configure ospf area 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf ase-limit

configure ospf **ase-limit** *number* {**timeout** *seconds*}

Description

Configures the AS-external LSA limit and overflow duration associated with *OSPF* database overflow handling.

Syntax Description

number	Specifies the number of external routes that can be held in a link-state database.
seconds	Specifies a duration for which the system has to remain in the overflow state.

Default

The default for timeout is 0, which indicates that once the router goes into overflow state, it stays there until OSPF is disabled and then re-enabled.

Usage Guidelines

Not applicable.

Example

The following command configures the AS-external LSA limit and overflow duration:

```
configure ospf ase-limit 50000 timeout 1800
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf ase-summary add

```
configure ospf ase-summary add [ipaddress ip-mask | ipNetmask] cost cost
   {tag number}
```

Description

Aggregates AS-external routes in a specified address range.

Syntax Description

ipaddress	Specifies an IP address.
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
cost	Specifies a metric that will be given to the summarized route.
tag	Specifies an *OSPF* external route tag.

Default

N/A.

Usage Guidelines

This command is only valid on an ASBR.

Example

The following command summarizes AS-external routes:

```
configure ospf ase-summary add 175.1.0.0/16 cost 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf ase-summary delete

```
configure ospf ase-summary delete [ip-address ip-mask | ipNetmask]
```

Description

Deletes an aggregated *OSPF* external route.

Syntax Description

ip-address	Specifies an IP address.
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.

Default

N/A.

Usage Guidelines

This command is only valid on an ASBR.

Example

The following command deletes the aggregated AS-external route:

```
configure ospf ase-summary delete 175.1.0.0/16
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf authentication

```
configure ospf [vlan [vlan-name | all ] | area area-identifier |
   virtual-link router-identifier area-identifier] authentication [ none
   | encrypted simple-password encrypted-simple-password | simple-
```

password { *simple-password*} | **encrypted md5** *md5-key-id encrypted-md5-key* | **md5** *md5-key-id* { *md5-key*}]

Description

Specifies the authentication password (up to eight characters) or RSA Data Security, Inc. *MD5* Message-Digest Algorithm key for one or all interfaces in a specific area or a virtual link.

Syntax Description

vlan-name	Specifies a *VLAN* name.
all	Specifies all VLANs
router-identifier	Specifies the router ID of the remote router.
area-identifier	Specifies an *OSPF* area.
encrypted	Indicates that the password (or key) is already encrypted (do not use this option).
simple-password	Specifies an authentication password (up to 8 ASCII characters).
md5_key_id	Specifies a RSA Data Security, Inc. MD5 Message-Digest Algorithm key, from 0-255.
md5_key	Specifies a numeric value from 0-65,536. Can also be alphanumeric, up to 26 characters.
none	Disables authentication.

Default

N/A.

Usage Guidelines

The md5_key is a numeric value with the range 0 to 65,536 or alphanumeric. When the OSPF area is specified, authentication information is applied to all OSPF interfaces within the area.

The encrypted option is used by the switch when generating a configuration file and when parsing a switch-generated configuration file. Do not select the encrypted option in the CLI.

Example

The following command configures RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication on the VLAN subnet_26:

```
configure ospf vlan subnet_26 authentication md5 32 test
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf cost

```
configure ospf [area area-identifier | vlan [vlan-name | all]] cost
   [automatic | cost]
```

Description

Configures the cost metric of one or all interface(s) or an area.

Syntax Description

area-identifier	Specifies an *OSPF* area.
vlan-name	Specifies a *VLAN* name.
all	Specifies all VLANs.
automatic	Determine the advertised cost from the OSPF metric table.
cost	Specifies the cost metric.

Default

The default cost is automatic.

Usage Guidelines

The range is 1 through 65535.

Example

The following command configures the cost metric of the VLAN accounting:

```
configure ospf vlan accounting cost 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf delete virtual-link

```
configure ospf delete virtual-link router-identifier area-identifier
```

Description

Removes a virtual link.

Syntax Description

router-identifier	Specifies the router ID of the other end of the link.
area-identifier	Specifies an *OSPF* area.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes a virtual link:

```
configure ospf delete virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf delete vlan

```
configure ospf delete vlan [vlan-name | all]
```

Description

Disables *OSPF* on one or all VLANs (router interfaces).

Syntax Description

vlan-name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

Not applicable.

Example

The following command disables OSPF on VLAN accounting:

```
configure ospf delete vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf import-policy

```
configure ospf import-policy [policy-map | none]
```

Description

Configures the import policy for *OSPF*.

Syntax Description

policy-map	Specifies the policy.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding OSPF routes to the IP route table. This command provides the flexibility of using import policy to determine the routes to be added to or removed from the routing table. In order to prevent a route being added to the routing table, the policy file must contain a matching rule with action “deny”. If there is no matching rule for a particular route, or the keyword “deny” is missing in the rule, the default action is “permit”, which means that route will be installed into the routing table.

Use the none option to remove an import policy.

If a policy rule set the cost to be greater than 65535, OSPF limits the metric of any matching routes to be 65535.

Example

The following example applies the policy campuseast to OSPF routes:

```
configure ospf import-policy campuseast
```

History

This command was first available in ExtremeXOS 10.1.

Beginning in ExtremeXOS 15.7, this command allows Import Policy to be used by OSPFv2 to install routes selectively into the switch routing table.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf lsa-batch-interval

`configure ospf` **`lsa-batch-interval`** *`seconds`*

Description

Configures the *OSPF* LSA batching interval.

Syntax Description

`seconds`	Specifies a time in seconds.

Default

The default setting is 30 seconds.

Usage Guidelines

The range is between 0 (disabled) and 600 seconds, using multiples of 5 seconds. The LSAs added to the LSDB during the interval are batched together for refresh or timeout.

Example

The following command configures the OSPF LSA batch interval to a value of 100 seconds:

```
configure ospf lsa-batch-interval 100
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf metric-table

configure ospf metric-table **10M** *cost_10m* **100M** *cost_100m* **1G** *cost_1g* {**2.5G** *cost_2_5g*} {**5G** *cost_5g*} {**10G** *cost_10g*} {**25G***cost_25g*} {**40G** *cost_40g*} {**50G** *cost_50g*}{**100G** *cost_100g*}

Description

Configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces, and optionally, the 2.5 Gbps, 5 Gbps, 10 Gbps, 25 Gbps, 40 Gbps, 50 Gbps, and 100 Gbps interfaces.

Syntax Description

cost	Specifies the interface cost for the indicated interfaces.

Default

- 10 Mbps—The default cost is 10.
- 100 Mbps—The default cost is 5.
- 1 Gbps—The default cost is 4.
- 2.5 Gbps—The default cost is 3.
- 5 Gbps—The default cost is 3.
- 10 Gbps—The default cost is 2.
- 25 Gbps—The default cost is 2.
- 40 Gbps—The default cost is 2.

- 50 Gbps—The default cost is 2.
- 100 Gbps—The default cost is 1.

Usage Guidelines

Not applicable.

Example

The following command configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces:

```
configure ospf metric-table 10m 20 100m 10 1g 2
```

History

This command was first available in ExtremeXOS 10.1.

The 40 Gbps parameter was added in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf priority

```
configure ospf [area area-identifier | vlan [vlan-name | all]] priority
   priority
```

Description

Configures the priority used in the designated router and backup designated router election algorithm for one or all *OSPF* interface(s) or for all the interfaces within the area.

Syntax Description

area-identifier	Specifies an OSPF area.
vlan-name	Specifies a *VLAN* name.
all	Specifies all VLANs.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

The range is 0 through 255, and the default setting is 1. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

Example

The following command sets all the interfaces in area 1.2.3.4 to not be selected as the designated router:

```
configure ospf area 1.2.3.4 priority 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf restart grace-period

`configure ospf restart grace-period` *`seconds`*

Description

Configures the grace period sent out in Grace-LSAs and used by a restarting router.

Syntax Description

`seconds`	Grace period, in seconds. The default value is 120 seconds. Range is 1 to 1800 seconds.

Default

The default is 120 seconds.

Usage Guidelines

This command configures the grace period sent out to helper neighbor routers and used by the restarting router. The value of the grace period must be greater that the dead interval, and less than the LSA refresh time.

Example

The following command configures a router to send LSAs with a 240 second grace period during graceful *OSPF* restarts:

```
configure ospf restart grace-period 240
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf restart

```
configure ospf restart [none | planned | unplanned | both]
```

Description

Configures the router as a graceful *OSPF* restart router.

Syntax Description

none	Do not act as a graceful OSPF restart router.
planned	Only act as a graceful OSPF restart router for planned restarts.
unplanned	Only act as a graceful OSPF restart router for unplanned restarts.
both	Act as a graceful OSPF restart router for both planned and unplanned restarts.

Default

The default is none.

Usage Guidelines

This command configures the router as a graceful OSPF router. When configured for planned restarts, it will advertise Grace-LSAs before restarting (for example, during an upgrade of the OSPF module). When configured for unplanned restarts, it will advertise Grace-LSAs after restarting but before sending any Hellos. When configured for both, the router will advertise restarting regardless of whether the restart was planned or unplanned.

Example

The following command configures a router to perform graceful OSPF restarts only for planned restarts:

```
configure ospf restart planned
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf restart-helper

```
configure ospf [vlan [all | vlan-name] | area area-identifier |
   virtual-link router-identifier area-identifier] restart-helper [none
   | planned | unplanned | both]
```

Description

Configures the router as a graceful *OSPF* restart helper router.

Syntax Description

all	Specifies all *VLAN*s
vlan-name	Specifies a VLAN name.
area-identifier	Specifies an OSPF area.
router-identifier	Specifies the router ID of the remote router of the virtual link.
none	Do not act as a graceful OSPF restart helper router.
planned	Only act as a graceful OSPF restart helper router for planned restarts.
unplanned	Only act as a graceful OSPF restart helper router for unplanned restarts.
both	Act as a graceful OSPF restart helper router for both planned and unplanned restarts.

Default

The router default is none.

Usage Guidelines

This command configures the router as a graceful OSPF restart helper router for a single or multiple routers. When the router is acting as a helper, it will continue to advertise the restarting router as if it was fully adjacent.

One OSPF interface may not help more than one restarting router. An OSPF interface may not enter helper mode when the router is performing a graceful restart. All the interfaces to a neighbor router must be configured as graceful restart helpers, or the router will not support graceful restart for its neighbor.

Example

The following command configures a router to be a graceful OSPF helper router for planned restarts for all routers in area 10.20.30.40:

```
configure ospf area 10.20.30.40 restart-helper planned
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf routerid

`configure ospf routerid [`**`automatic`**` | `*`router-identifier`*`]`

Description

Configures the *OSPF* router ID. If automatic is specified, the switch uses the highest IP interface address as the OSPF router ID.

Syntax Description

automatic	Specifies to use automatic addressing.
router-identifier	Specifies a router address.

Default

Automatic.

Usage Guidelines

Each switch that is configured to run OSPF must have a unique router ID. It is recommended that you manually set the router ID of the switches participating in OSPF, instead of having the switch automatically choose its router ID based on the highest interface IP address. Not performing this configuration in larger, dynamic environments could result in an older link-state database remaining in use.

Note
Do not set the router ID to 0.0.0.0.

Example

The following command sets the router ID:

```
configure ospf routerid 10.1.6.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf spf-hold-time

`configure ospf` **`spf-hold-time`** *`seconds`*

Description

Configures the minimum number of seconds between Shortest Path First (SPF) recalculations.

Syntax Description

`seconds`	Specifies a time in seconds. The range is 0 to 300 seconds.

Default

3 seconds.

Usage Guidelines

Not applicable.

Example

The following command configures the minimum number of seconds between Shortest Path First (SPF) recalculations:

```
configure ospf spf-hold-time 6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf virtual-link timer

```
configure ospf virtual-link router-identifier area-identifier timer
   retransmit-interval transit-delay hello-interval dead-interval
```

Description

Configures the timers for a virtual link.

Syntax Description

router-identifier	Specifies the router ID of the other end of the link.
area-identifier	Specifies an *OSPF* area.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1–3,600 seconds.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1–3,600 seconds.
hello-interval	Specifies the interval at which routers send hello packets. The range is 1–65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1–2,147,483,647 seconds.

Default

- *retransmit interval*—Default: 5
- *transit delay*—Default: 1
- *hello interval*—Default: 10

- *dead interval*—Default: 40
- *wait timer interval*—Default: dead interval

Usage Guidelines

Configuring OSPF timers on a per-area basis is a shorthand for applying the timers and authentication to each *VLAN* in the area at the time of configuration. If you add more VLANs to the area, you must configure the timers and authentication for the new VLANs explicitly.

Example

The following command sets the timers on the virtual link in area 0.0.0.2 and remote router ID 6.6.6.6:

```
configure ospf virtual-link 6.6.6.6 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf vlan area

configure ospf vlan *vlan-name* **area** *area-identifier*

Description

Associates a *VLAN* (router interface) with an *OSPF* area. By default, all router interfaces are associated with area 0.0.0.0.

Syntax Description

vlan-name	Specifies a VLAN name.
area-identifier	Specifies an OSPF area.

Default

Area 0.0.0.0

Usage Guidelines

Any OSPF network that contains more than one area is required to have an area configured as area 0, also called the backbone. All areas in an autonomous system must be connected to the backbone. When designing networks, you should start with area 0, and then expand into other areas.

The backbone allows summary information to be exchanged between ABRs. Every ABR hears the area summaries from all other ABRs. The ABR then forms a picture of the distance to all networks outside of its area by examining the collected advertisements, and adding in the backbone distance to each advertising router.

When a VLAN is configured to run OSPF, by default you must assign it to an area.

Example

The following command associates the VLAN accounting with an OSPF area:

```
configure ospf vlan accounting area 0.0.0.6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf vlan neighbor add

`configure ospf vlan` *vlan-name* **`neighbor add`** *ip-address*

Description

Configures the IP address of a point-to-point neighbor.

Syntax Description

vlan-name	Specifies a *VLAN* name.
ip-address	Specifies an IP address.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the IP address of a point-to-point neighbor:

```
configure ospf vlan accounting neighbor add 10.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf vlan neighbor delete

`configure ospf vlan` *`vlan-name`* **`neighbor delete`** *`ip-address`*

Description

Deletes the IP address of a point-to-point neighbor.

Syntax Description

`vlan-name`	Specifies a *VLAN* name.
`ip-address`	Specifies an IP address.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the IP address of a point-to-point neighbor:

```
configure ospf vlan accounting neighbor delete 10.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospf vlan timer

```
configure ospf vlan [vlan-name | all] timer retransmit-interval transit-
   delay hello-interval dead-interval {wait-timer-interval}
```

Description

Configures the *OSPF* wait interval for a *VLAN* or all VLANs.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1–3,600.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1–3,600 seconds.
hello-interval	Specifies the interval at which routers send hello packets. The range is 1–65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1–2,147,483,647.
wait-timer-interval	Specifies the interval between the interface coming up and the election of the DR and BDR. Usually equal to the dead timer interval.

Default

- *retransmit interval*—5 seconds.
- *transit delay*—1 second.
- *hello interval*—10 seconds.
- *dead interval*—40 seconds.
- *wait timer interval*—dead interval.

Usage Guidelines

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.

- dead interval—This interval should be a multiple of the hello interval.
- wait timer interval—This interval is required by the OSPF standard to be equal to the router dead interval. Under some circumstances, setting the wait interval to smaller values can help OSPF routers on a broadcast network to synchronize more quickly at the expense of possibly electing an incorrect DR or BDR. This value should not be set to less than the hello interval. The default value is equal to the router dead interval.

Example

The following command configures the OSPF wait interval on the VLAN accounting:

```
configure ospf vlan accounting timer 10 15 20 60 60
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 add interface all

```
configure ospfv3 add [vlan | tunnel] all {instance-id instanceId} area
   area_identifier {passive}
```

Description

Enables *OSPFv3* on all VLANs or all tunnels (router interfaces).

Syntax Description

all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
instanceId	Specifies the instance ID for these interfaces. Range is 0 to 255.
area_identifier	Specifies the area to which the interfaces are assigned.
passive	Specifies to stop sending and receiving hello packets on this interface.

Default

OSPFv3 is disabled on the interfaces.

The default instance ID is 0.

Usage Guidelines

This command is used to enable the OSPFv3 protocol on all IPv6 configured VLANs or all IPv6 tunnels. The instance ID is used to control the selection of other routers as neighbors. The router will become a neighbor only with routers that have the same instance ID.

To change the instance ID associated with an interface, you must first remove the interface from the OSPFv3 area and then add it back with a different instance ID.

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Example

The following command enables OSPFv3 on all IPv6 tunnels:

```
configure ospfv3 add tunnel all area 0.0.0.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 add interface

```
configure ospfv3 add [vlan vlan_name | tunnel tunnel_name] {instance-id
   instanceId} area area_identifier link-type [auto | broadcast | point-
   to-point] {passive}
```

Syntax Description

Enables *OSPFv3* on an interface.

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
instanceId	Specifies the instance ID for this interfaces. Range is 0 to 255.
area_identifier	Specifies the area to which the VLAN is assigned.
auto	Specifies to automatically determine the OSPFv3 link type based on the interface type.
broadcast	Specifies a broadcast link, such as Ethernet. Routers must elect a DR and a BDR during synchronization.

point-to-point	Specifies a point-to-point link type, such as PPP.
passive	Specifies to stop sending and receiving hello packets on this interface.

Default

The default link-type is Auto.

The default instance ID is 0.

Usage Guidelines

This command is used to enable the OSPFv3 protocol on an IPv6 configured VLAN or an IPv6 tunnel. The instance ID is used to control the selection of other routers as neighbors. The router will become a neighbor only with routers that have the same instance ID.

To change the instance ID associated with an interface, you must first remove the interface from the OSPFv3 area and then add it back with a different instance ID.

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Enable IPv6 forwarding before enabling OSPFv3; otherwise, you will receive a warning message.

You cannot change the **link-type** value while OSPFv3 is enabled on the interface.

Example

The following example adds the VLAN accounting (enabling OSPFv3 on the interface), to the area 0.0.0.1 with an instance ID of 2:

```
configure ospfv3 add vlan accounting instance-id 2 area 0.0.0.1 link-type auto
```

History

This command was first available in ExtremeXOS 11.2.

The **broadcast** and **point-to-point** link-type keywords were supported in ExtremeXOS 15.7.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 add virtual-link

configure ospfv3 **add virtual-link** {**routerid**} *router_identifier* {**area**} *area_identifier*

Description

Adds a virtual link connected to another ABR.

Syntax Description

router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies the transit area identifier, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- *router_identifier*—Far-end router identifier, a four-byte, dotted decimal number.
- *area_identifier*—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command configures a virtual link with router ID 10.1.2.1 through the transit area 10.1.0.0:

```
configure ospfv3 add virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area add range

```
configure ospfv3 area area_identifier add range ipv6netmask [advertise |
   noadvertise] [inter-prefix | nssa]
```

Description

Configures a range of IPv6 addresses in an *OSPFv3* area to be aggregated.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
ipv6netmask	Specifies an IPv6 address / prefix length.
advertise	Specifies to advertise the aggregated range of IPv6 addresses.
noadvert	Specifies not to advertise the aggregated range of IPv6 addresses.
inter-prefix	Specifies aggregate, inter-area-prefix LSAs.
nssa	NSSA LSAs.

Default

No OSPFv3 inter-area-prefix LSAs are configured.

Usage Guidelines

If advertised, the aggregated IPv6 range is exported as a single LSA by the ABR.

Example

The following command is used to summarize a certain range of IPv6 addresses within an area and export them out as a single address to area 0.0.0.1:

```
configure ospfv3 area 0.0.0.1 add range 2aaa:456:3ffe::/64 advertise inter-prefix
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area cost

```
configure ospfv3 area area_identifier cost [automatic | cost]
```

Description

Configures the cost of sending a packet to all interfaces belonging to an area.

Syntax Description

area_identifier	Specifies an *OSPFv3* area, a four-byte, dotted decimal number.
automatic	Determine the advertised cost from the OSPFv3 metric table.
cost	Specifies the cost metric. Range is 1 to 65535.

Default

The default cost is automatic.

Usage Guidelines

Use this command to set the cost of the links belonging to area manually, if the default cost needs to be overwritten. The interface cost is advertised as the link cost in router-LSA.

Example

The following command configures the cost of area 0.0.0.1 to 10. All the links of this area will inherit the area's cost value of 10.

```
configure ospfv3 area 0.0.0.1 cost  10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area delete range

configure ospfv3 **area** *area_identifier* **delete range** *ipv6netmask* [**inter-prefix** | **nssa**]

Description

Removes a range of IPv6 addresses in an *OSPFv3* area to be aggregated.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
ipv6netmask	Specifies an IPv6 address / prefix length.
inter-prefix	Inter-Area-Prefix LSAs.
nssa	NSSA LSAs.

Default

No OSPFv3 inter-area-prefix LSAs are configured.

Usage Guidelines

If you attempt to delete a range that was not configured, you receive an error message.

Example

The following command is used to delete a summary network from area 0.0.0.1:

```
configure ospfv3 area 0.0.0.1 delete range 2aaa:456:3ffe::/64
```

History

This command was first available in ExtremeXOS 11.2.

The **inter-prefix** and **nssa** keywords were added in ExtremeXOS 21.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area external-filter

configure ospfv3 **area** *area_identifier* **external-filter** [*policy_map* |**none**]

Description

Configures an external filter policy.

Syntax Description

area_identifier	Specifies the *OSPFv3* target area.
policy_map	Specifies a policy.
none	Specifies not to apply an external filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPFv3 areas (an ABR function), a policy can be applied to an OSPFv3 area that filters a set of OSPFv3 external routes from being advertised into that area, in other words, filtering some of the inbound AS-external-LSAs.

OPSFv3 routers that do not have enough memory to hold the entire AS-external-LSAa should configure an external area filter to drop part of the external-LSAs. Configuring this policy will enable routers with limited resources to be put into an OSPFv3 network.

Using the none mode specifies that no external filter is applied.

Policy files for this command will only recognize the following policy attributes:

- Match attributes:
  - nlri *IPv6-address/mask-len*
- Action (set) attributes
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example of an external filter policy file:

```
entry one {
    if match any{
        nlri 2001:db8:3e5c::/48;
        nlri 2001:db8:2146:2341::/64;
    } then {
        deny;
    }
}
```

Example

The following command configures an external filter policy, nosales for area 1.2.3.4:

```
configure ospfv3 area 1.2.3.4 external-filter nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area interarea-filter

```
configure ospfv3 area area_identifier interarea-filter [policy_map |
   none]
```

Description

Configures an inter-area filter policy.

Syntax Description

area_identifier	Specifies the *OSPFv3* target area.
policy_map	Specifies a policy.
none	Specifies not to apply an inter-area filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

ExtremeXOS OSPFv3 can apply an inter-area policy to filter some inter-area-prefix-LSAs and inter-area-router-LSAs from other areas. This can reduce the size of link state database of routers belonging to the area.

Using the none mode specifies that no external filter is applied.

Policy files for this command will only recognize the following policy attributes:

- Match attributes:
  - nlri *IPv6-address/mask-len*
- Action (set) attributes:
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example of an inter-area filter policy file:

```
entry one {
    if match any{
        nlri 2001:db8:3e5c::/48;
        nlri 2001:db8:2146:2341::/64;
    } then {
        deny;
    }
}
entry two {
    if match any{
        nlri 2001:db8:444::/48;
```

```
        nlri 2001:db8:541f:65bd::/64;
    } then {
        permit;
    }
}
```

Example

The following command configures an inter-area filter policy, nosales for area 1.2.3.4:

```
configure ospfv3 area 1.2.3.4 interarea-filter nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area normal

`configure ospfv3` **`area`** *`area_identifier`* **`normal`**

Description

Configures an *OSPFv3* area as a normal area.

Syntax Description

`area_identifier`	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

Normal.

Usage Guidelines

A normal area is an area that is not any of the following:

- Stub area
- NSSA

Virtual links can be configured through normal areas. External routes can be distributed into normal areas.

Example

The following command configures an OSPFv3 area as a normal area:

```
configure ospfv3 area 10.1.0.0 normal
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area nssa

```
configure ospfv3 area area-identifier nssa [nosummary | summary] stub-
   default-cost cost {translate}
```

Description

NSSAs are similar to the *OSPFv3* stub area configuration option, but have the following two additional capabilities:

- External routes originating from an ASBR connected to the NSSA can be advertised within the NSSA.
- External routes originating within the NSSA can be propagated to other areas if translated to AS-external LSAs. When configuring an OSPFv3 area as an NSSA, the translate option should only be used on NSSA border routers, where translation is to be enforced. If translate is not used on any NSSA border router, one of the ABRs for that NSSA is elected to perform translation.

Syntax Description

area-identifier	Area identifier.
nosummary	Inter-Area-Prefix LSAs prohibited.
summary	Inter-Area-Prefix LSAs allowed.
cost	Route metric.
translate	Always translate NSSA LSAs to AS-external LSAs.

Default

None.

Usage Guidelines

This command must specify the cost of the default route advertised into the NSSA.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 area priority

```
configure ospfv3 area area_identifier priority priority
```

Description

Configures the priority used in the designated router and backup designated router election algorithm for all the interfaces within the area.

Syntax Description

area_identifier	Specifies an *OSPFv3* area, a four-byte, dotted decimal number.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

When two routers are attached to a network, both attempt to become the designated router. The one with the higher priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

Example

The following command sets all the interfaces in area 1.2.3.4 to not be selected as the designated router:

```
# configure ospfv3 area 1.2.3.4 priority 0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

On switches with a Core or Premier license, the non-zero interface priority takes effect; on switches with and Advanced Edge or Base license, the default interface priority is 0.

configure ospfv3 area stub

```
configure ospfv3 area area_identifier stub [summary | nosummary] stub-
   default-cost cost
```

Description

Configures an *OSPFv3* area as a stub area.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
summary	Specifies that inter-area LSAs can be propagated into the area.
nosummary	Specifies that inter-area LSAs cannot be propagated into the area.
cost	Specifies a cost metric.

Default

N/A.

Usage Guidelines

A stub area is connected to only one other area. The area that connects to a stub area can be the backbone area. External route information is not distributed into stub areas. Stub areas are used to reduce memory consumption requirements on OSPFv3 routers.

Example

The following command configures an OSPFv3 area as a stub area:

```
configure ospfv3 area 0.0.0.6 stub nosummary stub-default-cost 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 area timer

```
configure ospfv3 area area_identifier timer {retransmit-interval}
   retransmit_interval {transit-delay} transit_delay {hello-interval}
   hello_interval {dead-interval} dead_interval
```

Description

Configures the timers for all interfaces in the same *OSPFv3* area.

Syntax Description

area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 1,800 seconds.
transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 1,800 seconds.
hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65,535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65,535 seconds.

Default

- Retransmit interval—Default: 5 seconds
- Transit delay—Default: 1 second
- Hello interval—Default: 10 seconds
- Dead interval—Default: 40 seconds

Usage Guidelines

Configuring OSPFv3 timers on a per-area basis is a shorthand for applying the timers to each *VLAN* and tunnel in the area at the time of configuration. If you add more VLANs or tunnels to the area, you must configure the timers for them explicitly.

Specify the following:

- Retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- Transit delay—The transit delay must be greater than 0.
- Hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- Dead interval—This interval should be a multiple of the hello interval.

The value of the dead interval and the hello interval must be same for all OSPFv3 routers connected to a common link. The value of the dead interval and the hello interval are advertised by OSPFv3 in Hello

packets. The shorter the hello interval, the earlier topological changes will be detected, but more routing traffic will ensue.

The retransmit interval must be greater than the expected round trip delay between any two routers on the attached network. The setting of this parameter must be conservative, or needless retransmission will result.

Note

The wait interval for the interface is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers in area 0.0.0.2:

```
configure ospfv3 area 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 authentication (Authentication Trailer)

```
configure ospfv3 [{vlan} vlan-name | {tunnel} tunnel-name]
   authentication [keychain keychain-name | none]
```

Description

Configures Authentication Trailer with a manual key to provide authentication on OSPFv3 interfaces.

Syntax Description

ospfv3	Specifies *OSPFv3* interface.
vlan	Specifies OSPFv3 VLAN.
vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel	Specifies Layer 3 tunnel.
tunnel-name	Specifies Layer 3 tunnel name.
authentication	Specifies interface authentication.
keychain	Specifies the set of authentication keys.

keychain-name	Specifies the keychain name.
none	Specifies no authentication (default).

Default

If not specified, no authentication is applied.

Usage Guidelines

Users can only add keychains that are already present in the system. To add a keychain, run the command `create keychain keychain_name` .

Example

The following example for VLAN "vlan1" applies authentication type Authentication Trailer:

```
# configure ospfv3 vlan1 authentication keychain ospfv3-keys1
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 authentication (IPsec)

```
configure ospfv3 [{vlan} vlan-name | {tunnel} tunnel-name]
   authentication [none |ipsec spi spi esp-auth-algorithm algorithm key
   [key-string | encrypted encrypted-key-string]
```

Description

Configures Internet Protocol Security (IPsec) with a manual key to provide authentication on OSPFv3 interfaces.

Syntax Description

ospfv3	Specifies *OSPFv3* interface.
vlan	Specifies OSPFv3 VLAN.
vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel	Specifies Layer 3 tunnel.
tunnel-name	Specifies an Layer 3 tunnel name.

authentication	Specifies interface authentication.
none	Specifies no authentication (default).
ipsec spi	Specifies the authentication type is IPsec Encapsulating Security Payload (ESP) with manual key.
spi	Specifies Security Parameter Index value. Range is 256-4294967295.
esp-auth-algorithm	Specifies the ESP Authentication algorithm.
algorithm	Specifies the authentication algorithm. Supported authentication algorithms are hmac-sha-1 and hmac-sha-256.
key	Specifies the authentication key.
key-string	Specifies the key string in clear text. Both the ASCII string and hexadecimal string are supported, and hexadecimal string must begin with “0x”.
encrypted	Specifies that the key string is in encrypted format.
encrypted-key-string	Specifies the encrypted key string. The encrypted key string must be enclosed in double quotes.

Default

If not specified, no authentication is applied.

Usage Guidelines

When configuring IPsec with manual key on an OSPFv3 VLAN, the exact same IPsec parameters (SPI, algorithm and key-string) must be specified on all routers connected to that VLAN.

To configure OSPFv3 virtual link authentication, run the command **ospfv3 virtual-link** {**routerid**} *router-identifier* {**area**} *area-identifier* **authentication** [**none** | **ipsec spi** *spi* **esp-auth-algorithm** *algorithm* **key** [*key-string* | **encrypted** *encrypted-key-string*].

Example

The following example for VLAN "v1" applies authentication type IPsec with SPI "551" and algorithm "hmac-sha-256" with key "mykey":

```
# configure ospfv3 vlan v1 authentication ipsec spi 551 esp-auth-algorithm hmac-sha-256
key mykey
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 bfd

```
configure ospfv3 vlan vlan-name bfd on | off
```

Description

Configures BFD for *OSPFv3*.

Syntax Description

bfd	Bidirectional forwarding detection
on	Turn on BFD for OSPFv3 interface.
off	Turn off BFD for OSPFv3 interface.

Default

Off.

Usage Guidelines

Use this command to turn on or off BFD protection on a specific OSPFv3 interface.

The following example configures BFD protection on for *VLAN* 1:

Example

```
# configure ospfv3 vlan1 bfd on
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 delete interface

```
configure ospfv3 delete [vlan vlan_name | tunnel tunnel_name | [vlan |
   tunnel] all]
```

Description

Disables *OSPFv3* on one or all *VLAN*s or tunnels (router interfaces).

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all VLANs, or tunnels.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables OSPFv3 on VLAN accounting:

```
configure ospfv3 delete vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 delete virtual-link

```
configure ospfv3 delete virtual-link {routerid} router_identifier {area}
   area_identifier
```

Description

Deletes a virtual link connected to another ABR.

Syntax Description

router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies the transit area identifier, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- Router-identifier—Far-end router identifier, a four-byte, dotted decimal number.
- Area-identifier—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command deletes a virtual link with router ID 10.1.2.1 through the transit area 10.1.0.0:

```
configure ospfv3 delete virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 import-policy

configure ospfv3 **import-policy** [*policy_map* | **none**]

Description

Configures the import policy for *OSPFv3*.

Syntax Description

policy_map	Specifies the policy.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding OSPFv3 routes to the IPv6 route table. This command provides the flexibility of using import policy to determine the routes to be added to or removed from the routing table. In order to prevent a route being added to the routing table, the policy file must contain a matching rule with action “deny”. If there is no matching rule for a particular route, or the keyword “deny” is missing in the rule, the default action is “permit”, which means that route will be installed into the routing table.

Use the **none** option to remove the policy association.

Policy files for this command will recognize only the following policy attributes:

- Match attributes:
  - nlri *IPv6-address/mask-len*
  - route-origin [ospf | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-intra]
- Action (set) attributes
  - cost *cost*
  - tag *number*
  - deny

Any other policy attribute will not be recognized and will be ignored.

Example

The following example applies the policy campuseast to OSPFv3 routes:

```
configure ospfv3 import-policy campuseast
```

History

This command was first available in ExtremeXOS 11.2.

Beginning in ExtremeXOS 15.7, this command allows Import Policy to be used by OSPFv3 to install routes selectively into the switch routing table.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 interface area

```
configure ospfv3 [vlan vlan_name | tunnel tunnel_name] area
   area_identifier
```

Description

Moves an interface from one *OSPFv3* area to another.

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

Use this command to move an already configured interface from one area to another. The instance ID associated with the interface will be unchanged.

Example

The following command moves the VLAN accounting to the OSPFv3 area 0.0.0.6:

```
configure ospfv3 vlan accounting area 0.0.0.6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 interface cost

```
configure ospfv3 [vlan vlan_name | tunnel tunnel_name | [vlan | tunnel]
   all]] cost [automatic | cost]
```

Description

Configures the cost of one or all interface(s).

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.

automatic	Determine the advertised cost from the *OSPFv3* metric table.
cost	Specifies the cost metric. Range is 1 to 65535.

Default

The default cost is automatic.

Usage Guidelines

Use this command to set the cost of an interface (a VLAN or tunnel) manually, if the default cost needs to be overwritten. The interface cost is advertised as the link cost in router-LSA.

Example

The following command configures the cost metric of the VLAN accounting:

```
configure ospfv3 vlan accounting cost 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 interface priority

```
configure ospfv3 [vlan vlan_name | tunnel tunnel_name | [vlan | tunnel]
   all] priority priority
```

Description

Configures the priority used in the designated router and backup designated router election algorithm for one or all *OSPFv3* interface(s).

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

When two routers are attached to a network, both attempt to become the designated router. The one with the higher priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

Example

The following command sets the priority of the interface VLAN corporate to 10:

```
# configure ospfv3 vlan corporate priority 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

On switches with a Core or Premier license, the non-zero interface priority takes effect; on switches with an Advanced Edge or Base license, the default interface priority is 0.

configure ospfv3 interface timer

```
configure ospfv3 [vlan vlan_name | tunnel tunnel_name | [vlan
   | tunnel] all] timer {retransmit-interval} retransmit_interval
   {transit-delay} transit_delay {hello-interval} hello_interval {dead-
   interval} dead_interval
```

Description

Configures the timers for all interfaces in the same *OSPFv3* area.

Syntax Description

vlan_name	Specifies an IPv6 configured *VLAN*.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 3600 seconds.

transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 3600 seconds.
hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65535 seconds.

Default

- Retransmit interval—Default: 5 seconds.
- Transit delay—Default: 1 second.
- Hello interval—Default: 10 seconds.
- Dead interval—Default: 40 seconds.

Usage Guidelines

Use this command to configure the OSPFv3 timers on a per-interface basis.

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- dead interval—This interval should be a multiple of the hello interval.

The value of the dead interval and the hello interval must be same for all OSPFv3 routers connected to a common link. The value of the dead interval and the hello interval are advertised by OSPFv3 in Hello packets. The shorter the hello interval, the earlier topological changes will be detected, but more routing traffic will ensue.

The retransmit interval must be greater than the expected round trip delay between any two routers on the attached network. The setting of this parameter must be conservative, or needless retransmission will result.

Note

The wait interval for the interface is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers for the VLAN corporate:

```
configure ospfv3 vlan corporate timer retransmit-interval 10 transit-delay 2 hello-
interval 20 dead-interval 80
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 lsa-batch-interval

```
configure ospfv3 lsa-batch-interval seconds
```

Description

This command configures the LSA batch interval. LSAs added during this interval are batched together for update.

Syntax Description

seconds	Interval in seconds. Range is 0 to 600. (Default 0, not batched).

Default

0.

Usage Guidelines

The range is 0 to 600 seconds.

Example

The following example shows the output of the `show ospfv3` command including the LSA batch interval output:

```
# show ospfv3
OSPFv3                : Disabled           RouterId            : 0.0.0.0

isis-level-2           Disabled  20        2     ---    none
isis-level-1-external  Disabled  20        2     ---    none
isis-level-2-external  Disabled  20        2     ---    none
host-mobility          Disabled  20        2     ---    none
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 metric-table

```
configure ospfv3 metric-table [{10M cost_10m} {100M cost_100m } {1G
   cost_1g}{2.5G cost_2_5g} {5G cost_5g} {10G cost_10g} {25G cost_25g}
   {40G cost_40g} {50G cost_50g} {100G cost_100g} ]
```

Description

Configures the optional interface costs for 10 Mbps, 100 Mbps, 1 Gbps. 2.5 Gbps, 5 Gbps, 10 Gbps, 25 Gbps 40 Gbps, 50 Gbps, and 100 Gbps interfaces.

Syntax Description

cost_x	Specifies the interface cost for the indicated interfaces. Range is 1 to 65535.

Default

- 10 Mbps—The default cost is 100.
- 100 Mbps—The default cost is 50.
- 1 Gbps—The default cost is 40.
- 2.5 Gbps—The default cost is 40.
- 5 Gbps—The default cost is 40.
- 10 Gbps—The default cost is 20.
- 25 Gbps—The default cost is 20.
- 40 Gbps—The default cost is 20.
- 50 Gbps—The default cost is 20.
- 100 Gbps—The default cost is 10.

Usage Guidelines

The value of the costs cannot be greater for higher speed interfaces. In other words, the following condition must be true:

cost_10m >= cost_100m >= cost_1g >= cost_2.5g >= cost_5g cost_10g >= cost_25g >= cost_40g >= cost_50g >= cost_100g

Example

The following command configures the automatic interface costs for 10 Mbps, 100 Mbps, 1 Gbps, 2.5 Gbps, 5 Gbps, 10 Gbps, 25 Gbps, 40 Gbps, 50 Gbps, and 100 Gbps interfaces:

```
configure ospfv3 metric-table 10M 110 100M 70 1G 50 2.5G 45 5G 40 10G 35 25G 30 40G 25
50G 20 100G 15
```

The following example displays the output of the show ospfv3 command:

```
# show ospfv3
OSPFv3               : Disabled           RouterId            : 0.0.0.0

  host-mobility          Disabled  20        2     ---    none
```

History

This command was first available in ExtremeXOS 11.2.

The 40 Gbps parameter was added in ExtremeXOS 12.6.

The 2.5G, 5G, 25G and 50G speeds were added in ExtremeXOS 22.1.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 restart

```
configure ospfv3 restart [none | planned | unplanned | both]
```

Description

This command configures the graceful restart behavior the router.

Syntax Description

none	Disable graceful restart.
planned	Support planned restart only.
unplanned	Support unplanned restart only.
both	Support both planned and unplanned restart.

Default

Graceful restart is disabled by default.

Usage Guidelines

When configured for planned restarts, it will support planned restarts (like process restart) and advertise Grace LSAs before restarting. When configured for unplanned restarts, it will support unplanned restarts (like failover in a stack) and advertise Grace LSAs after restarting but before sending any Hellos. When configured for both, the router will support both planned and unplanned restarts. Unplanned restarts and BFD configuration on interfaces are incompatible in ExtremeXOS. If both are enabled, an unplanned restart will fail.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 restart grace-period

```
configure ospfv3 restart grace-period seconds
```

Description

This command configures the grace period sent out in Grace LSAs and used by a restarting router.

Syntax Description

seconds	Interval in seconds. Range is 1 to 1800.

Default

The default grace period is 120 seconds.

Usage Guidelines

The range is 1 to 1800 seconds. The grace period should be greater than hello interval and router dead interval of the *OSPFv3* interfaces on the router.

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 restart-helper

```
configure ospfv3 [[vlan | tunnel] all | {vlan} vlan-name | {tunnel}
   tunnel-name | area area-identifier] restart-helper [none | planned |
   unplanned | both]
```

Description

This command configures graceful restart helper mode behavior of *OSPFv3* interfaces for its neighbors. When an interface is acting as a helper, it will continue to advertise the restarting router as if it was fully adjacent.

Syntax Description

vlan	
all	Variable description, available options, and notes.
vlan-name	*VLAN* name.
area	OSPFv3 area.
area-identifier	Area identifier.
none	Disable helper mode.
planned	Support planned restart only.

unplanned	Support unplanned restart only.
both	Support both planned and unplanned restart.

Default

Restart helper mode is disabled by default.

Usage Guidelines

When the area option is used the command applies to all interfaces in the area at that time. One OSPFv3 interface may not help more than one restarting router at a time. An OSPFv3 interface may not enter helper mode when the router is performing a graceful restart. All the interfaces to a neighbor router must be configured as graceful restart helpers, or the router will not support graceful restart for its neighbor.

Restart Helper mode is displayed in the `show ospfv3 interfaces detail` output.

```
# show ospfv3 interfaces detail

```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 routerid

```
configure ospfv3 routerid [automatic | router_identifier]
```

Description

Configures the *OSPFv3* router ID. If automatic is specified, the switch uses the highest IPv4 interface address as the OSPFv3 router ID.

Syntax Description

automatic	Specifies to use automatic addressing.
router_identifier	Specifies a router identifier, a four-byte, dotted decimal number.

Default

Automatic.

Usage Guidelines

Each switch that is configured to run OSPFv3 must have a unique router ID. The router ID is a four-byte, dotted decimal number, like an IPv4 address. Even though the IP address format has changed from IPv4 to IPv6, the router ID format has not. It is recommended that you manually set the router ID of the switches participating in OSPFv3, instead of having the switch automatically choose its router ID based on the highest interface IPv4 address (if it exists). Not performing this configuration in larger, dynamic environments could result in an older link-state database remaining in use.

This command is accepted only when OSPFv3 is globally disabled.

Note
Do not set the router ID to 0.0.0.0.

Example

The following command sets the router ID to 10.1.6.1:

```
configure ospfv3 routerid 10.1.6.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 spf-hold-time

```
configure ospfv3 spf-hold-time seconds
```

Description

Configures the minimum number of seconds between Shortest Path First (SPF) recalculations.

Syntax Description

spf-hold-time	SPF hold time.
seconds	Specifies a time in seconds. The range is 0 to 300 seconds.

Default

3 seconds.

Usage Guidelines

Setting the interval too high will force *OSPFv3* to run SPF calculations less frequently. This will reduce the CPU load, but will cause delay in routes getting updated in the IPv6 routing table. Setting the interval too low will decreases the interval between SPF calculations, but will increase the processing load on CPU.

Example

The following command configures the minimum number of seconds between Shortest Path First (SPF) recalculations:

```
configure ospfv3 spf-hold-time 6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 virtual-link authentication (Authentication Trailer)

```
configure ospfv3 virtual-link {routerid} router-identifier {area} area-
   identifier authentication [keychain keychain_name | none]
```

Description

Configure Authentication Trailer with a manual key to provide authentication on OSPFv3 virtual-links.

Syntax Description

ospfv3	Specifies *OSPFv3* virtual-link.
virtual-link	OSPFv3 virtual link.
routerid	OSPFv3 router ID.
router-identifier	Specifies the router identifier of the advertising router.
area	OSPFv3 area.
area-identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
authentication	Specifies interface authentication.
keychain	Specifies the set of authentication keys.
keychain-name	Specifies the keychain name.
none	Specifies no authentication (default).

Default

If not specified, no authentication is applied.

Usage Guidelines

Users can only add keychains that are already present on the system. Keychains can be created using this command `create keychain keychain_name` .

Example

The following example for virtual-link with a router id of 10.1.1.3 and an area identifier of 1.1.1.1:

```
# configure ospfv3 virtual-link 10.1.1.3 area 1.1.1.1 authentication keychain ospfv3-
keys1
```

History

This command was first available in ExtremeXOS 31.3.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 virtual-link authentication

```
configure ospfv3 virtual-link {routerid} router-identifier {area} area-
   identifier authentication [none | keychain keychain-name | ipsec
   spi spi esp-auth-algorithm algorithm key [key-string | encrypted
   encrypted-key-string]
```

Description

Configure Internet Protocol Security (IPsec) with a manual key to provide authentication on OSPFv3 virtual-links.

Syntax Description

ospfv3	Specifies *OSPFv3* virtual-link.
virtual-link	OSPFv3 virtual link.
routerid	OSPFv3 router ID.
router-identifier	Specifies the router identifier of the advertising router.
area	OSPFv3 area.
area-identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
authentication	Specifies interface authentication.
none	Specifies no authentication (default).
keychain	Specifies the authentication method is keychain.
keychain-name	Specifies the keychain name.
ipsec spi	Specifies the authentication type is IPsec Encapsulating Security Payload (ESP) with manual key.
spi	Specifies Security Parameter Index value. Range is 256-4294967295.
esp-auth-algorithm	Specifies the ESP Authentication algorithm.
algorithm	Specifies the authentication algorithm. Supported authentication algorithms are hmac-sha-1 and hmac-sha-256.
key	Specifies the authentication key,
key-string	Specifies the key string in clear text. Both the ASCII string and hexadecimal string are supported, and hexadecimal string must begin with “0x”.
encrypted	Specifies that the key string is in encrypted format.
encrypted-key-string	Specifies the encrypted key string. The encrypted key string must be enclosed in double quotes.

Default

If not specified, no authentication is applied.

Usage Guidelines

When configuring IPsec with a manual key on an OSPFv3 virtual link, the exact same IPsec parameters (SPI, algorithm and key-string) must be specified on all routers connected to both sides of the virtual link.

To configure OSPFv3 VLAN authentication, run the command `configure` **`ospfv3`** [{**`vlan`**} *`vlan-name`* | {**`tunnel`**} *`tunnel-name`*] **`authentication`** [**`none`** |**`ipsec spi`** *`spi`* **`esp-auth-algorithm`** *`algorithm`* **`key`** [*`key-string`* | **`encrypted`** *`encrypted-key-string`*].

Example

The following example for virtual-link "5.5.5.5 0.0.0.2" applies authentication type IPsec with SPI "1001" and algorithm "hmac-sha-1" with key "mykey":

```
# configure ospfv3 virtual-link 5.5.5.5 0.0.0.2 authentication ipsec spi 1001 esp-auth-algorithm hmac-sha-1 key mykey
```

History

This command was first available in ExtremeXOS 31.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ospfv3 virtual-link restart-helper

`configure ospfv3` **`virtual-link`** {**`routerid`**} *`router-identifier`* {**`area`**} *`area-identifier`* **`restart-helper`** [**`none`** | **`planned`** | **`unplanned`** | **`both`**]

Description

This command configures graceful restart helper mode behavior of *OSPFv3* interfaces for its neighbors. When an interface is acting as a helper, it continues to advertise the restarting router as if it was fully adjacent.

Syntax Description

`virtual-link`	OSPFv3 virtual link.
`routerid`	OSPFv3 router ID.
`router-identifier`	Router ID of neighbor OSPFv3 router.

area	OSPFv3 area.
area-identifier	Transit area ID of virtual link.
restart-helper	Graceful restart helper mode.
none	Disable helper mode (default).
planned	Support planned restart only.
unplanned	Support unplanned restart only.
both	Support both planned and unplanned restart.

Default

Helper mode is disabled by default.

Usage Guidelines

When the area option is used, the command applies to all interfaces in the area at that time. One OSPFv3 interface may not help more than one restarting router at a time. An OSPFv3 interface may not enter helper mode when the router is performing a graceful restart. All the interfaces to a neighbor router must be configured as graceful restart helpers, or the router does not support graceful restart for its neighbor.

Restart helper mode appears in the `show ospfv3 interfaces detail` output.

```
# show ospfv3 interfaces detail
Interface : v100 Enabled : ENABLED

```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ospfv3 virtual-link timer

```
configure ospfv3 virtual-link {routerid} router_identifier {area}
   area_identifier timer {retransmit-interval} retransmit_interval
   {transit-delay} transit_delay {hello-interval} hello_interval {dead-
   interval} dead_interval
```

Description

Configures the timers for a virtual link.

Syntax Description

router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies an *OSPFv3* area, a four-byte, dotted decimal number.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 3600 seconds.
transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 3600 seconds.
hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65535 seconds.

Default

- Retransmit interval—Default: 5 seconds.
- Transit delay—Default: 1 second.
- Hello interval—Default: 10 seconds.
- Dead interval—Default: 40 seconds.

Usage Guidelines

In OSPFv3, all areas must be connected to a backbone area. If the connection to the backbone is lost, it can be repaired by establishing a virtual link.

The smaller the hello interval, the faster topological changes will be detected, but more routing traffic will ensue.

The setting of the retransmit interval should be conservative, or needless retransmissions will result. The value should be larger for serial lines and virtual links.

The transmit delay value should take into account the transmission and propagation delays for the interface.

Note
The wait interval is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers on the virtual link to router 6.6.6.6 transiting area 0.0.0.2:

```
configure ospfv3 virtual-link 6.6.6.6 area 0.0.0.2 timer 10 transit-delay 1
hello-interval 20 dead-interval 200
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with Base license, or higher, as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure pim add vlan

```
configure pim {ipv4 | ipv6} add vlan [vlan-name | all] {dense | sparse}
   {passive}
```

Description

Configures an IP interface for PIM.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan-name	Specifies a *VLAN* name.
all	Specifies all VLANs.
dense	Specifies PIM dense mode (PIM-DM). (Default mode.)
sparse	Specifies PIM sparse mode (PIM-SM).
passive	Specifies a passive interface.

Default

Dense.

Usage Guidelines

When an IP interface is created, per-interface PIM configuration is disabled by default.

The switch supports both dense mode and sparse mode operation. You can configure dense mode or sparse mode on a per-interface basis. After they are enabled, some interfaces can run dense mode, while others run sparse mode.

Passive interfaces are host only interfaces that allow a multicast stream from other VLANs to be forwarded to edge hosts. Since they do not peer with other PIM routers, you should not connect a multicast router to a passive interface.

In order for the interface to participate in PIM, PIM must be globally enabled on the switch using the following command: `enable pim`

Example

The following example enables PIM-DM multicast routing on VLAN accounting:

```
configure pim add vlan accounting dense
```

History

This command was first available in ExtremeXOS 10.1.

The **passive** option was added in ExtremeXOS 11.1.

The **IPv4** and **IPv6** options were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim anycast-rp

`configure pim {`**`ipv4`** `|` **`ipv6`**`}` **`anycast-rp`** *`ip_address`* `[`*`policy`* `|` **`none`**`]`

Description

Configures or removes a rendezvous point (RP) for Anycast RP using PIM (*RFC 4610*).

Syntax Description

ipv4	Specifies IPv4 address family.
ipv6	Specifies IPv6 address family.
anycast-rp	Specifies configuring Anycast RP.
ip_address	Specifies the Anycast RP address.
policy	Specifies the policy file having a list of IP addresses of peer RP nodes. These IP addresses should be specified using NLRI keyword.
none	Specifies removing an Anycast RP and associated policy containing peer information.

Default

N/A.

Usage Guidelines

The Anycast RP using PIM feature provides fast convergence when RP routers fail using PIM protocol without using the source discovery protocol Multicast Source Discovery Protocol (MSDP) for both IPv4 and IPv6 address families.

To view Anycast RP using PIM information, use the `show pim {`**`ipv4`** `|` **`ipv6`**`}` **`anycast-rp`** `{`*`ip_address`*`}` command.

Example

The following example specifies the router at IP address 10.45.7.12 as the Anycast RP with `policy_file` as the policy file with the list of peer Anycast RP nodes:

```
# configure pim ipv4 anycast-rp 10.45.7.12 policy_file
```

With a `policy_file` of:

```
entry policy1 {
if match any{
nlri 10.10.10.1/32;
nlri 20.20.20.1/32;
nlri 30.30.30.1/32;
}
then {
permit;
}
}
```

The following example removes the RP router at IP address 10.45.7.12

```
# configure pim ipv4 anycast-rp 10.45.7.12 none
```

History

This command was first available in ExtremeXOS 31.1.

Platform Availability

This command is available on platforms that support the appropriate license for the PIM feature. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements*.

configure pim border

```
configure pim {ipv4 | ipv6} [{vlan} vlan_name] border
```

Description

Configures a PIM *VLAN* as a border VLAN, which is used to demarcate a PIM domain when using *MSDP*.

Syntax Description

ipv4	Configures a PIM timer on IPv4 router interfaces.
ipv6	Configures a PIM timer on IPv6 router interfaces.
vlan_name	Specifies a VLAN name.
border	Interface is domain border.

Default

None.

Usage Guidelines

MSDP is used to connect multiple multicast routing domains. A PIM-SM domain is created by limitingthe reach of PIM BSR advertisements. When a border VLAN is configured, PIM BSR advertisements are not forwarded out of the PIM VLAN.

Example

The following example configures a PIM border on a VLAN called "vlan_border":

```
configure pim vlan_border border
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *ExtremeXOS User Guide*.

configure pim cbsr

```
configure pim cbsr {ipv4 | ipv6} [{vlan} vlan_name {priority [0-255]} |
   none]
```

Description

Configures a candidate bootstrap router for PIM sparse-mode operation.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan_name	Specifies a *VLAN* name.
priority	Specifies a priority setting. The range is 0 - 255.
none	Deletes a CBSR.

Default

The default setting for priority is 0, and indicates the lowest priority.

Usage Guidelines

The VLAN specified for CBSR must have PIM enabled for it to take effect. After PIM is enabled, CBSRs advertise themselves in the PIM domain. A bootstrap router (BSR) is elected among all the candidates based on CBSR priority. To break the tie among routers with the same priority setting, the router with the numerically higher IP address is chosen.

An ExtremeXOS switch can support up to 145 RPs per group when it is configured as a PIM BSR (bootstrap router). If more than 145 RPs are configured for a single group, the BSR ignores the group and does not advertise the RPs. Non-BSR switches can process more than 145 RPs in the BSR message.

Example

The following example configures a candidate bootstrap router on the VLAN accounting:

```
configure pim cbsr vlan accounting 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim crp static

```
configure pim {ipv4 | ipv6} crp static ip_address [none | policy]
   {priority [0-255]}
```

Description

Configures a rendezvous point and its associated groups statically, for PIM sparse mode operation.

Syntax Description

ipv4	Specifies an IPv4 address.
ipv6	Specifies an IPv6 address.
ip_address	Specifies a static CRP address.
none	Deletes the static rendezvous point.
policy	Specifies a policy file name.
priority	Specifies a priority setting. The range is 0–255.

Default

The default setting for priority is 192. Priority value 0 indicates the highest priority.

Usage Guidelines

In PIM-SM, the router sends a join message to the rendezvous point (RP). The RP is a central multicast router that is responsible for receiving and distributing multicast packets. If you use a static RP, all switches in your network must be configured with the same RP address for the same group (range).

ExtremeXOS switches support up to 64 static RPs (32 IPv4 and 32 IPv6), and up to 180 groups (group/mask entries) in a single RP policy file. If you configure more than 180 group entries in a single RP policy file, the switch will not process entries added after the first 180.

The policy file contains a list of multicast group addresses served by this RP.

This policy file is not used for filtering purposes. As used with this command, the policy file is just a container for a list of addresses. So a typical policy file used for RP configuration looks a little different from a policy used for other purposes.

If routers have different group-to-RP mappings, due to misconfiguration of the static RP (or any other reason), traffic is disrupted.

Example

The following example statically configures an RP and its associated groups defined in policy file rp-list:

```
configure pim crp static 10.0.3.1 rp-list
```

The following is a sample policy file:

```
entry extreme1 {
if match any {  }
then { nlri  224.0.0.0/4 ;
nlri  239.255.0.0/24 ;
nlri  232.0.0.0/8 ;
nlri  238.1.0.0/16 ;
nlri  232.232.0.0/20 ;
}
}
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim crp timer

`configure pim {`**`ipv4`** `|` **`ipv6`**`}` **`crp timer`** *`crp_adv_interval`*

Description

Configures the candidate rendezvous point advertising interval in PIM sparse mode operation.

Syntax Description

ipv4	Specifies an IPv4 address.
ipv6	Specifies an IPv6 address.
crp_adv_interval	Specifies a candidate rendezvous point advertising interval in seconds. The range is 1 to 1,717,986,918.

Default

The default is 60 seconds.

Usage Guidelines

Increasing this time results in increased convergence time for CRP information to the PIM routers.

Example

The following example configures the candidate rendezvous point advertising interval to 120 seconds:

```
configure pim crp timer 120
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim crp vlan

```
configure pim {ipv4 | ipv6} crp vlan vlan_name [none | policy]
   {priority}
```

Description

Configures the dynamic candidate rendezvous point (CRP) for PIM sparse-mode operation.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan_name	Specifies a *VLAN* name.
none	Specifies to delete a CRP.
policy	Specifies a policy file name.
priority	Specifies a priority setting. The range is 0–255.

Default

The default setting for priority is 192. Priority value 0 indicates the highest priority.

Usage Guidelines

ExtremeXOS switches support up to 50 RPs in a switch, and up to 180 groups (group/mask entries) in a single RP policy file. If you configure more than 180 group entries in single RP policy file, then the switch will not process entries added after first 180.

The policy file contains the list of multicast group addresses serviced by this RP. This set of group addresses are advertised as candidate RPs. Each router then elects the common RP for a group address based on a common algorithm. This group to RP mapping should be consistent on all routers.

This policy file is not used for filtering purposes. As used with this command, the policy file is just a container for a list of addresses. So a typical policy file used for RP configuration looks a little different from a policy used for other purposes. The following is a sample policy file that configures the CRP for the address ranges 239.0.0.0/24 and 232.144.27.0/24:

```
entry extreme1 {
    if match any {
    }
        then {
            nlri  239.0.0.0/24 ;
            nlri  232.144.27.0/24 ;
    }
}
```

The VLAN specified for a CRP must have PIM configured.

To delete a CRP, use the keyword none as the access policy.

Example

The following example configures the candidate rendezvous point for PIM sparse-mode operation on the VLAN HQ_10_0_3 with the policy rp-list and priority set to 30:

```
configure pim crp HQ_10_0_3 rp-list 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim delete vlan

`configure {`**`ipv4`** `|` **`ipv6`**`} pim delete` **`vlan`** `[`*`vlanname`* `|` **`all`**`]`

Description

Disables PIM on a router interface.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlanname	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

Use this command to disable PIM for a specific or all VLANs.

Example

The following example disables PIM on VLAN accounting:

```
configure pim delete vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim dense-neighbor-check

```
configure pim dense-neighbor-check [on | off}
```

Description

This command is used to configure a PIM interface that receives multicast data traffic. It could be either from a source directly connected or from a PIM neighbor. In the second case (from a source not directly connected), if the received interface has no PIM neighbor, the traffic is dropped (default behavior). If you turn off this check, the traffic is processed.

Syntax Description

dense-neighbor-check	Check if multicast traffic is received from PIM neighbor in dense mode.
on	Drop multicast traffic if not received from PIM neighbor (default).
off	Forward multicast traffic even if not received from PIM dense neighbor.

Default

The default is on.

Example

The following example turns on dense neighbor check:

```
configure pim dense-neighbor-check on
```

History

This command was first available in ExtremeXOS 15.1.4.

Platform Availability

This command is available on platforms that support the appropriate license. For more information, see the *Switch Engine 32.2 Feature License Requirements*.

configure pim dr-priority

```
configure pim {ipv4 | ipv6} [ {vlan} vlan_name | vlan all ] dr-priority
   priority
```

Description

Configures the designated router (DR) priority that is advertised in PIM hello messages.

Syntax Description

ipv4	IPv4 address family (default).
ipv6	IPv6 address family.
vlan all	Apply to all *VLANs*.
dr-priority	Designated Router Priority for VLAN.
priority	Priority value for VLAN (default 1). The range is 0–4294967295.

Default

The default setting for **dr-priority** is 1.

Usage Guidelines

The **dr-priority** option allows a network administrator to give preference to a particular router in the DR election process by giving it a numerically larger DR priority. The **dr-priority** option is included in every hello message, even if no DR priority is explicitly configured on that interface. This is necessary because priority-based DR election is only enabled when all neighbors on an interface advertise that they are capable of using the **dr-priority** option.

The DR priority is a 32-bit unsigned number, and the numerically larger priority is always preferred. A router's idea of the current DR on an interface can change when a PIM hello message is received, when a neighbor times out, or when a router's own DR priority changes. If the router becomes the

DR or ceases to be the DR, this will normally cause the DR register state machine to change states. Subsequent actions are determined by that state machine. The DR election process on interface is as follows:

- If any one of the neighbor on the interface is not advertised the DR priority (not DR capable) then DR priority will not considered for the all the neighbors in the circuit, and the primary IP address will be considered for all the neighbors.
- The higher DR priority or higher primary address will be elected as DR.

Example

```
configure pim ipv4 vlan accounting dr-priority 10
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim iproute sharing hash

```
configure pim {ipv4 | ipv6} iproute sharing hash [source | group |
   source-group | source-group-nexthop]
```

Description

This command is used to configure the PIM *ECMP* hash algorithm.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
hash	Configure Hash Algorithm for Equal Cost Multipath Routing.
source	Hash for route sharing is based on source address only.
group	Hash for route sharing is based on group address only.
source-group	Hash for route sharing is based on source and group addresses.
source-group-nexthop	Hash for route sharing is based on source, group, and next hop addresses (default).

Default

Source-group-nexthop.

Usage Guidelines

Use this command to modify the hash algorithm used by PIM for path selection.

Example

The following command configures the PIM ECMP hash algorithm based on source-group-nexthop:

```
configure pim ipv6 iproute sharing hash source-group-nexthop
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license.

configure pim register-policy

configure pim {**ipv4** | **ipv6**} **register-policy** [*rp_policy_name* | **none**]

Description

Configures the register filter at the First Hop Router (FHR). This is the router to which the multicast source is connected to.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
rp_policy_name	Specifies the Policy File for Register filter.
none	Unconfigures the configured FHR Register filter.

Default

IPv4.

Usage Guidelines

Use this command to add or remove a First Hop Router Register Filter policy.

Example

The following example configures an IPv4 register policy named "entry_policy" at the FHR:

```
configure pim ipv4 register-policy entry_policy
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim register-policy rp

configure pim {**ipv4** | **ipv6**} **register-policy rp** [*rp_policy_name* | **none**]

Description

Configures the register filter at the Rendezvous Point.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
rp_policy_name	Specifies the Policy File for RP Register filter.
none	Unconfigures the configured RP Register filter.

Default

N/A.

Usage Guidelines

Use this command to add or remove a Rendezvous Point Register Filter policy.

Example

The following example configures IPv4 register policy named "entry_policy":

```
configure pim ipv4 register-policy rp entry_policy
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim register-rate-limit-interval

```
configure pim {ipv4 | ipv6} register-rate-limit-interval interval
```

Description

Configures the initial PIM-SM periodic register rate.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
interval	Specifies an interval time in seconds. Range is 0 - 60. Default is 0.

Default

The default interval is 0.

Usage Guidelines

Configuring a non-zero interval time can reduce the CPU load on the first hop switch, in case register stop messages are not received normally.

When a non-zero value is configured, the first hop switch sends a few register messages and then waits for a corresponding register stop from the RP for *time* seconds. The process is repeated until the register stop is received. This command should be used when the (S,G) tree between the first hop router and the RP is not converging quickly.

When the default value is zero in default mode, the switch sends continuous register messages until the register stop is received.

Example

The following example configures the initial PIM register rate limit interval:

```
configure pim register-rate-limit-interval 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim register-suppress-interval register-probe-interval

```
configure pim {ipv4 | ipv6} register-suppress-interval reg-interval
   register-probe-interval probe_interval
```

Description

Configures an interval for periodically sending null-registers.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
reg-interval	Specifies an interval time in seconds. Range is 30 - 200 seconds. Default is 60.
probe-interval	Specifies an interval time in seconds. Default is 5.

Default

The following defaults apply:

- register-suppress-interval—60
- register-probe-interval—5

Usage Guidelines

The register-probe-interval time should be set less than the register-suppress-interval time. By default, a null register is sent every 55 seconds (register-suppress-interval – register-probe-interval). A response to the null register is expected within register probe interval. By specifying a larger interval, a CPU peak load can be avoided because the null-registers are generated less frequently. The register probe time should be less than half of the register suppress time, for best results.

Example

The following example configures the register suppress interval and register probe time:

```
configure pim register-suppress-interval 90 register-probe time 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim snooping sgrpt-prune

```
configure pim snooping sgrpt-prune [accept | drop]
```

Description

Configures <S,G,RPT> prune messages processing by PIM Snooping.

Syntax Description

accept	<S,G,RPT> prune messages are processed.
drop	<S,G,RPT> prune messages are not processed.

Default

Default configuration is accept.

Usage Guidelines

Use this command when it is desirable to disable PIM <S,G,RPT> prune messages processing by PIM Snooping.

Example

The following example disables <S,G,RPT> prune messages processing by PIM Snooping:

```
configure pim snooping sgrpt-prune drop
```

History

This command was first available in ExtremeXOS 15.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the Feature License Requirements document.

configure pim shutdown-priority

configure pim {**ipv4** | **ipv6**} [{**vlan**} *vlan_name* | **vlan all**] **shutdown-priority** *number*

Description

Configures the priority for out of memory shutdown.

Syntax Description

ipv4	Configures a PIM timer on IPv4 router interfaces.
ipv6	Configures a PIM timer on IPv6 router interfaces.
vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.
number	Priority for VLAN range is [0 - 65535].

Default

IPv4.

Usage Guidelines

None.

Example

The following example configures the shutdown priority for VLAN 36:

```
config pim vlan v36 shutdown-priority 22
```

History

This command was first available in ExtremeXOS 12.4.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim spt-threshold

```
configure pim {ipv4 | ipv6} spt_threshold [infinity | leaf_threshold]
   {rp_threshold}
```

Description

Configures the threshold, in kbps, for switching to SPT. On leaf routers, this setting is based on data packets. On the RP, this setting is based on register packets. When infinity option is configured on First

Hop Routers or Intermediary Routers, SPT switching is disabled. Traffic forwarding will be performed based on RPT paths only.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
infinity	Disables Shortest Path Tree (SPT) switching on Last Hop or Intermediary routers.
leaf-threshold	Specifies the rate of traffic per (s,g,v) group in kbps for the last hop. Range is 0 - 4194303.
rp_threshold	Specifies an RP threshold. Range is 0 - 4194303.

Default

The default setting is 0 for both parameters.

Usage Guidelines

For the best performance, use default value of 0.

Example

The following example changes the threshold for switching to SPT:

```
configure pim spt-threshold 4 16
```

History

This command was first available in ExtremeXOS 10.1.

The **infinity** option was added in ExtremeXOS 15.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim ssm range

```
configure pim {ipv4 | ipv6} ssm range [default | policy policy-name]
```

Description

Configures the range of multicast addresses for PIM SSM.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
default	Specifies the default address range. 232.0.0.0/8 for IPv4 or FF3x::/96 for IPv6.
policy-name	Specifies a policy that defines the SSM address range.

Default

By default, no SSM range is configured. Using this command with the default keyword sets the range to 232.0.0.0/8. To reset the switch to the initial state, use the `unconfigure pim ssm range` command.

Usage Guidelines

Initially, no range is configured for SSM. After a range is configured, you can remove the range with the `unconfigure pim ssm range` command. If you wish to change the PIM SSM range, you must first unconfigure the existing range, and then configure the new range.

SSM requires that hosts use IGMPv3 messages to register to receive multicast group packets. When a range is configured for SSM, any IGMPv2 messages for an address in the range are ignored. Also, any IGMPv3 Exclude messages are ignored.

Note

If a PIM-SSM range is configured, IGMPv2 messages and IGMPv3 exclude messages within the PIM-SSM range are ignored on all IP interfaces, whether or not PIM-SSM is configured on the interfaces.

To specify a range different from the default PIM SSM range, create a policy file. The match statement of the policy file contains the group addresses to be treated as PIM SSM addresses. For example, to specify the PIM SSM address range as 232.0.0.0/8 and 233.0.0.0/8, use the following policy file:

```
Entry extreme1 {
    if match any {
        nlri  232.0.0.0/8 ;
        nlri  233.0.0.0/8 ;
    }
    then {
        permit ;
    }
}
```

Example

The following example sets the PIM SSM range to 232.0.0.0/8 and 233.0.0.0/8, if the policy file ssmrange.pol contains the policy example used above:

```
configure pim ssm range policy ssmrange
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim state-refresh timer origination-interval

```
configure pim {ipv4 | ipv6} state-refresh timer origination-interval
   interval
```

Description

Configures the interval at which state refresh messages are originated.

Syntax Description

interval	Specifies a refresh interval in seconds. The range is 30–90 seconds.

Default

60 seconds.

Usage Guidelines

None.

Example

The following example configures the interval to 45 seconds:

```
configure pim state-refresh timer origination-interval 45
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim state-refresh timer source-active-timer

```
configure pim {ipv4 | ipv6} state-refresh timer source-active-timer
   interval
```

Description

Defines how long a multicast source (S,G) is considered active after a packet is received from the source.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
interval	Specifies a source-active timer interval in seconds. The range is 90–300 seconds.

Default

210 seconds.

Usage Guidelines

None.

Example

The following example configures the interval to 180 seconds:

```
configure pim state-refresh timer source-active-timer 180
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim state-refresh ttl

```
configure pim {ipv4 | ipv6} state-refresh ttl ttlvalue
```

Description

Configures a time-to-live (TTL) value for PIM-DM state refresh messages.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
ttl_value	Specifies a TTL value. The range is 1–64.

Default

16.

Usage Guidelines

None.

Example

The following example configures the TTL value for 24:

```
configure pim state-refresh ttl 24
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim state-refresh

```
configure pim {ipv4 | ipv6} state-refresh {vlan} [vlan_name | all] [on |
   off]
```

Description

Enables or disables the PIM-DM state refresh feature on one or all *VLAN*s.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.

vlan_name	Specifies a VLAN on which to enable or disable the PIM-DM state refresh feature.
on	Enables the PIM-DM state refresh feature on the specified VLANs.
off	Disables the PIM-DM state refresh feature on the specified VLANs.

Default

Disabled.

Usage Guidelines

When this feature is disabled on an interface, the interface behaves as follows:

- State refresh messages are not originated.
- State refresh messages received on the interface are dropped without processing.
- State refresh messages received on other interfaces are not forwarded to the disabled interface.

Example

The following example enables the PIM-DM state refresh feature on VLAN blue:

```
configure pim state-refresh blue on
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim timer vlan

```
configure pim {ipv4 | ipv6} timer hello_interval jp_interval [{vlan}
   vlan_name | vlan all]
```

Description

Configures the global PIM timers on the specified router interfaces.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.

hello_interval	Specifies the amount of time before a hello message is sent out by the PIM router. The range is 1–65,535 seconds.
jp_interval	Specifies the join/prune interval. The range is 1–65,535 seconds.
vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

- hello_interval—30 seconds
- jp_interval—60 seconds

Usage Guidelines

These default timers should only be adjusted when excess PIM control packets are observed on the interface.

Example

The following example configures the PIM timers on the VLAN accounting:

```
configure pim timer 150 300 vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure pim vlan trusted-gateway

```
configure pim {ipv4 | ipv6} [{vlan} vlan_name] trusted-gateway [policy |
   none]
```

Description

Configures a trusted neighbor policy.

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
vlan_name	Specifies a *VLAN* name.

policy	Specifies a policy file name.
none	Specifies no policy file, so all gateways are trusted.

Default

No policy file, so all gateways are trusted.

Usage Guidelines

Because PIM leverages the unicast routing capability that is already present in the switch, the access policy capabilities are, by nature, different. When the PIM protocol is used for routing IP multicast traffic, the switch can be configured to use a policy file to determine trusted PIM router neighbors for the VLAN on the switch running PIM. This is a security feature for the PIM interface.

Example

The following example configures a trusted neighbor policy on the VLAN backbone using the policy "nointernet":

```
configure pim vlan backbone trusted-gateway nointernet
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure policy access-list

```
configure policy access-list [rule-precedence [list_dot_rule [after
   member_rule | before member_rule | first | last ] ] ]
```

Description

Adds rules and configures the rule precedence list for an access-list.

Syntax Description

access-list	Configures access-list rule model.
rule-precedence	Specifies modifying a rule's precedence in the access-list.
list_dot_rule	Specifies the access-list name and rule name in the format *list_name.rule_name*.

after	Moves the rule after an existing entry.
before	Moves the rule before an existing entry.
member_rule	Specifies the access-list name and rule name in format *list_name.rule_name*.
first	Makes the rule the first.
last	Makes the rule the last.

Default

N/A.

Usage Guidelines

An access-list always contains at least one rule and is not active or programmed until it is assigned to a profile. Assigning a different profile ID to an access-list that already has one overwrites the current value. Setting the profile ID to “none” removes the access-list from the active/programmed rules. A profile ID can only be assigned to an access-list, and not per rule, so the *list_name* must only contain an access-list and not a *list_dot_rule* value.

Example

The following example places the access-list "ACL1.ace3" before "ACL1.ace1":

```
# configure policy access-list rule-precedence ACL1.ace3 before ACL1.ace1
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy autoclear

```
configure policy autoclear {interval interval}
```

Description

Sets the interval at which the switch automatically clears rule usage statistics.

Syntax Description

autoclear	Designates setting the parameters for auto-clearing the policy rule usage statistics.
interval	Designates setting the interval when the switch automatically clears rule usage. Default is 0 (statistics are not automatically cleared).
interval	Sets the value for the interval in minutes when the switch automatically clears rule usage. Range is 0 to 65,535.

Default

By default, the **autoclear** interval is 0, which means that statistics are not automatically cleared.

Usage Guidelines

If you have configured Syslog and/or trap actions to notify you when a policy rule is used by using the following command: `configure policy rule` *profile_index* [{**app-signature group** *group* **name** *name*} | **ether** *ether* | **icmp6type** *icmp6type* | **icmptype** *icmptype* | **ip6dest** *ip6dest* |**ipdestsocket** *ipdestsocket* | **ipfrag** | **ipproto** *ipproto* | **ipsourcesocket** *ipsourcesocket* | **iptos** *iptos* | **ipttl** *ipttl* | **macdest** *macdest* | **macsource** *macsource* | **port** *port* | **tcpdestportIP** *tcpdestportIP* | **tcpsourceportIP** *tcpsourceportIP* | **udpdestportIP** *udpdestportIP* | **udpsourceportIP** *udpsourceportIP*] {**mask** *mask* } {**port-string** [*port_string* | **all**]} {**storage-type** [**non-volatile** | **volatile**]} {**drop** | **forward**} {**syslog** *syslog*} {**trap** *trap*} {**cos** *cos* } {**mirror-destination** *control_index*} {**clear-mirror**} , this command allows you to set the interval when these statistics will be cleared.

To view the auto-clear interval, use the following command:

`show policy` **autoclear interval**

Example

The following example sets the interval for automatically clearing rule usage statistics to 1 minute:

```
# configure policy autoclear interval 1
```

History

This command was available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy app-signature group name pattern

```
configure policy app-signature group group name name [add | delete]
   pattern_list
```

Description

Configures a user-defined policy application signature.

Syntax Description

app-signature	Configures application signature specific settings.
group	Configures application signature group-specific settings.
group	Specifies the group name.
name	Configures application signature display name-specific settings.
name	Specifies the display name assigned to the application signature. Maximum of 32 characters. To see name choices, use the `show policy` **app-signature group** {*group* {**name** *name*}} {**built-in** | **custom** {**detail**} | **detail**} command.
add	Adds patterns to the display name.
delete	Removes patterns from the display name.
pattern_list	Specifies a list of strings enclosed in quotes used to identify the application, each separated by a space. Maximum of 255 characters.

Default

N/A.

Usage Guidelines

The application signature groups are built-in and additional ones cannot be created. There are built-in values for application signature names, which cannot be modified or deleted.

Example

The following example for the group name "E-commerce" and application signature name "Warehouse" adds the patterns "bjs.com", "costco.com", and "samsclub.com":

```
# configure policy app-signature group "E-commerce" name  Warehouse add "bjs.com
costco.com samsclub.com"
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy app-signature minimum-ttl

```
configure policy app-signature minimum-ttl [none | 1 | 5 | 10]
```

Description

Configures a minimum time-to-live (TTL) value for Layer 7 policy/application signature.

Syntax Description

app-signature	Specifies configuring application signature settings.
minimum-ttl	Specifies setting override to low DNS-reply TTL values with a minimum value. The default is none, which specifies not overriding the TTL values.
none	Specifies not overriding DNS-reply TTL values (default).
1	Specifies a minimum TTL of 1 minute.
5	Specifies a minimum TTL of 5 minutes.
10	Specifies a minimum TTL of 10 minutes.

Default

By default, the DNS-reply TTL values are not overridden (**none**).

Usage Guidelines

To view the TTL minimum value set by this command, use the `show policy app-signature` command.

Example

The following example sets a minimum TTL of 5 minutes:

```
# configure policy app-signature minimum-ttl 5
```

History

This command was first available in ExtremeXOS 30.5.

Limitations

The ExtremeSwitching 5520 series switch does not support Layer 7 policy (DNS).

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy captive-portal

```
configure policy captive-portal web-redirect redirect_index server
   server_id {url redirect_url} {status}
```

Description

This command configures a captive portal server's HTTP redirect URL and its status.

Syntax Description

web-redirect	Configures web-redirect.
redirect_index	Configures a web redirect index (range = 1–10).
server	Configures a server for the web redirect index.
server_id	Sets the server ID to use (range = 1–2).
url	Configures captive portal server absolute URL.
redirect_url	Sets HTTP/HTTPS URL that users are redirected to `http(s)://<IPv4Address or Hostname>:<L4Port>/<Path>` Where `IPV4Address` or `Hostname` is the IPv4 address or hostname of the captive portal server (DNS server needs to be configured on the device). `L4Port` by default is 80. Should be provided with the value on which the captive portal web-server is running.
status	Captive portal server status: "enable" or "disable" (default is disable).

Default

By default, captive portal server status is disabled.

Example

The following example configures and enables the URL for a particular captive portal server (index 2) in web-redirect (index 1):

```
configure policy captive-portal web-redirect 1 server 2 url http://192.168.1.1:80/static/
index.jsp enable
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy captive-portal listening

```
configure policy captive-portal listening socket_list
```

Description

This command configures which L4 listening ports (sockets) are redirected when a captive portal web-redirect is defined on a policy profile.

Syntax Description

listening	Configures captive portal HTTP listening ports (up to three L4 ports).
socket_list	List of L4 ports on which to listen (1–65,535) separated by commas (for example: 80,8080,2000).

Default

N/A

Usage Guidelines

You can configure a maximum of three L4 listening ports.

Example

The following example configures two L4 listening ports 80 and 8080 to be redirected by captive portal:

```
configure policy captive-portal listening 80,8080
```

The following example add one more L4 listening port 2000:

```
configure policy captive-portal listening 2000
```

The following example tries to apply a fourth listening port 5000. This fails because you can only have three listening ports configured:

```
configure policy captive-portal listening 5000
ERROR: Unable to add 5000. Only 0 remaining socket(s) available.
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy captive-portal rule-use

```
configure policy captive-portal rule-use [reserved | unreserved]
```

Description

Configures whether or not captive portal *ACL* rules are programmed within the reserved space for ONEPolicy.

Syntax Description

captive-portal	Configures captive portal elements.
rule-use	Configures captive portal rule use.
reserved	Configures captive portal to program rules in the space reserved by resource-profile configuration at the expense of IPv4 group rules.
unreserved	Configures captive portal to program rules outside the space reserved by resource-profile configuration (default).

Default

By default, captive portal rules are programmed outside of the reserved space for ONEPolicy.

Usage Guidelines

If not specified to do otherwise, ONEPolicy programs its captive portal-related rules outside of the reserved ACL rule space for ONEPolicy (unreserved). This results in additional ACL slice usage. This command enables you to specify that these rules are programmed within the already reserved ACL rule space at the expense of IPv4 rule capacity (reserved).

To view the selection for this command, use the `show policy captive-portal {web-redirect {redirect_index | all} | listening | rule-use}` command with the **rule-use** option.

Example

The following example confines captive portal ACL rules to the reserved space for ONEPolicy:

```
# configure policy captive-portal rule-use reserved
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy convergence-endpoint

```
configure policy convergence-endpoint [enable | disable]
```

Description

This command globally enables or disables Convergence End Point (CEP) for ONEPolicy.

Syntax Description

enable	Enables CEP for ONEPolicy.
disable	Disables CEP for ONEPolicy.

Default

By default CEP is disabled.

Usage Guidelines

This feature requires that ONEPolicy is enabled on the switch (see enable policy on page 2271).

Example

The following example enables CEP on the switch:

```
# configure policy convergence-endpoint enable
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy convergence-endpoint clear

```
configure policy convergence-endpoint clear ports [port_list | all]
```

Description

This command clears all existing Convergence End Point (CEP) connections per port.

Syntax Description

ports	Specify ports to configure.
port_list	Designates which ports to clear CEP connections from.

Default

N/A

Example

The following example clears CEP connections from port 3:

```
# configure policy convergence-endpoint clear ports 3
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy convergence-endpoint index

```
configure policy convergence-endpoint index index [cisco | lldp-med]
```

Description

This command sets a global default policy index for a Convergence End Point (CEP) detection type. This policy is applied when a phone of the specified type is detected on a port.

Syntax Description

index	The policy index to apply. Use 0 to clear an index. Note: After CEP devices are mapped to a profile, changing the index value to "0" or to some other policy profile name, the existing CEP connections are still be mapped to the old profile that was configured initially when the CEP devices were detected. To force a refresh of existing detected devices, disable, and then enable, CEP (see configure policy convergence-endpoint on page 1113) or disable, and then enable, the port(s) (see disable port on page 1949 and enable port on page 2272).
cisco	Specifies Cisco type CEP.
lldp-med	Specifies *LLDP*-MED type CEP.

Default

N/A

Usage Guidelines

The corresponding policy must be configured using the policy management commands (for example, configure policy profile on page 1118).

Example

The following example applies as default the policy associated with index number "12" to Cisco type CEPs.

```
# configure policy convergence-endpoint index 12 cisco
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy convergence-endpoint ports

```
configure policy convergence-endpoint ports [<port_list> | all] [cisco |
   lldp-med] [enable | disable]
```

Description

This command enables or disables a Convergence End Point (CEP) detection type on one or more ports.

Syntax Description

port_list	Specifies ports to configure for CEP detection.
all	Specifies that all ports are configured for CEP detection.
cisco	Selects Cisco type of CEP detection.
lldp-med	Selects *LLDP*-MED type of CEP detection.
enable	Enables CEP for the provided type.
disable	Disables CEP for the provided type.

Default

By default, CEP detection is disabled on all ports for all types.

Usage Guidelines

This feature requires that ONEPolicy is enabled on the switch (see enable policy on page 2271).

Example

The following example configures CEP detection for Cisco type on port 3:

```
# configure policy convergence-endpoint ports 3 cisco enable
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy invalid action

```
configure policy invalid action [default-policy | drop | forward]
```

Description

This command configures what action is taken for an invalid policy.

Syntax Description

default-policy	Ignore the result and search for the next policy assignment rule.
drop	Block traffic.
forward	Forward traffic as if no policy has been assigned via 802.1D/Q rules.

Default

None.

Example

This example shows how to assign a drop action to invalid policies:

```
X450G2-48t-10G4.4 # configure policy invalid action drop
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy maptable

```
configure policy maptable [response [tunnel | policy | both] | vlan_list
   profile_index]
```

Description

Use this command to add entries to the mapping table and to set the map table response state for the switch.

Syntax Description

vlan_list	*VLAN* ID or range of IDs (1–4,094)
profile_index	Policy ID (1–63).
response	Indicates which attributes to use from RADIUS response.
tunnel	Applies the VLAN-tunnel attribute. VLAN/NSI mappings from RADIUS are used if present. Mappings in policy profile are ignored.
policy	Applies the policy specified in the filter-ID. VLAN/NSI mappings from policy profile are used if present. Mappings in RADIUS response are ignored.
both	An enhanced policy option that applies either all the filter-ID and VLAN tunnel attributes or the policy depending upon whether one or both are present. VLAN/NSI mappings from either RADIUS or policy profile may be used. Mappings in RADIUS response have a higher precedence over policy profile when both contain mappings.

Default

N/A.

Usage Guidelines

The policy response is the default response for the `configure policy maptable` command.

Example

This example adds an entry to the map table that maps VLAN 3 to policy profile 8:

```
configure policy maptable 3 8
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy port

```
configure policy port ports admin-id admin_id
```

Description

This command assigns an administrative rule to a port.

Syntax Description

ports	Port string
admin-id	Policy ID
admin_id	Policy ID (1-63).

Default

N/A.

Usage Guidelines

Use this command to assign an administrative rule to a port.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy profile

```
configure policy profile profile_index {name name} {pvid pvid} {pvid-
   status pvid_status} {cos cos} {cos-status cos_status} {egress-
   vlans egress_vlan_list}{forbidden-vlans forbidden_vlans} {untagged-
   vlans untagged_vlans} {append | clear} {tci-overwrite tci_overwrite}
   {precedence [precedence | default]} {auth-override auth_override}
   {nsi [nsi | none]} {web-redirect web_redir_index} {access-list
   [unassigned | list_name | list_name_placeholder]}
```

Description

Creates a policy profile entry.

Syntax Description

profile_index	Policy ID (1-63).
name	Policy profile name.
name	Profile name string 1-64 characters.
pvid-status	PVID status (enable/disable).
pvid	PVID value (0-4,095). Default is 1, which specifies Default VLAN.
cos-status	*CoS* status (enable/disable).
cos	Class of Service value (0-22).
egress-vlans	Egress *VLAN* list (1-4094).
forbidden-vlan	Forbidden VLAN list (1–4,094).
untagged-vlans	Untagged VLAN list (1-4,094).
append	Append to one of Egress, Forbidden, Untagged VLAN list.
clear	Clear from one of Egress, Forbidden, Untagged VLAN list.
tci_overwrite	TCI-overwrite status (enable/disable). Note: The ExtremeSwitching 5520 platform does not support TCI-overwrite. Note: With tci-overwrite disabled, you can only add a VLAN to incoming packets that are untagged or priority tagged (priority set, but vlan=0).
auth-override	Configures authentication override using a port profile attribute. No further authentication occurs on the port if enabled.
auth_override	Authentication override status: "enable" or "disable". Default is disabled.
precedence	Specifies setting the policy classification rule precedence. Note: You cannot set a precedence if the rule model is set for ACL Style Policy (access-list). To set the rule model, use the command `configure policy` **`rule-model`** [**`access-list`** | **`hierarchical`**].
precedence	Sets the rule precedence (for example: 1–2, 10, 12–18, 20–23, 25, 31). To see the supported rules, use `show policy profile {`**`all`** | *`profile_index`*`}` {**`detail`**} .
default	Sets the default rule precedence, rather than a custom one (1–2, 10, 12–19, 23, 20–22, 25, 31).
web-redirect	Configures web-redirect.
web_redir_index	Configures a web redirect index (range = 1–10). Default is 0, which is disabled.
nsi	Network Service Identifier. For Fabric Attach and VXLAN (VNI = NSI), provides a mechanism to apply the VLAN/NSI mappings in policy using a profile-based attribute.
nsi	NSI 24-bit value ranging from 1 to 16,777,215.

none	No NSI for the VLAN (default).
access-list	Designates assigning an access list to this profile.
unassigned	Removes an assigned access list (default).
list_name	Selects the access list name to assign to this profile. Type the access-list name as shown in the provided list.
list_name_placeholder	Allows you to provide an access-list name that does not currently exist to assign to this profile.

Default

If optional parameters are not specified, none are applied.

Web direct is disabled by default.

The default for NSI is none.

If no PVID value is given, the default is 1 (Default VLAN).

If you do not set a policy classification rule precedence, the default order is used (1–2, 10, 12–19, 23, 20–22, 25, 31).

By default, not access list is assigned to a profile.

Usage Guidelines

Use this command to create a policy profile entry.

Example

This example shows how to create a policy profile 1 named "netadmin" with PVID override enabled for PVID 10, and Class-of-Service override enabled for CoS 5. This profile can use VLAN 10 for untagged egress:

```
# configure policy profile 1 name netadmin pvid-status enable pvid 10 cos-status enable
cos 5 untagged-vlans 10
```

History

This command was first available in ExtremeXOS 16.1.

The authentication override parameter was added in ExtremeXOS 22.2.

The NSI keyword was added in ExtremeXOS 22.5.

Policy classification rule precedence re-ordering was added in ExtremeXOS 30.2.

Access list capability was added in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy resource-profile

```
configure policy resource-profile [default |less-acl [more-ipv4 | more-
   ipv4-no-ipv6 | more-ipv4-no-l2 |more-ipv4-no-mac-no-ipv6] | more-
   ipv4-no-mac-no-ipv6-no-l2 | more-ipv4-no-ipv6 | more-ipv4-no-mac-no-
   ipv6 | more-mac-no-ipv6] {profile-modifier [{no-mac no_mac} {no-ipv4
   no_ipv4} {no-ipv6 no_ipv6} {no-l2 no_l2}]}
```

Description

Configures a profile that controls the policy rule resources available for MAC/IPv4/IPv6/L2.

Syntax Description

default	Configure a profile with the default settings.
less-acl	Configure a profile that removes some access list resources to be used for rules.
more-ipv4	Configure a profile that adds IPv4 rules.
more-ipv4-no-ipv6	Configure a profile that adds IPv4 rules at the expense of IPv6 rules.
more-ipv4-no-l2	Configure a profile that adds IPv4 rules at the expense of L2 rules. L2 ether rules are accounted for in the first available space from IPv4, IPv6, or MAC group.
more-ipv4-no-mac-no-ipv6	Configure a profile that adds IPv4 rules at the expense of MAC and IPv6 rules
more-ipv4-no-mac-no-ipv6-no-l2	Configure a profile that adds IPv4 rules at the expense of MAC, IPv6, and L2 rules. L2 ether rules are accounted for in the IPv4 group.
more-mac-no-ipv6	Configure a profile that adds MAC rules at the expense of IPv6 rules.
profile-modifier	Specifies modifying the current profile settings.
no-mac	Specifies modifying the current profile, which removes all MAC rules.
no_mac	Specifies removing all MAC rules: "enable" or "disable" (default is disabled).
no-ipv4	Specifies modifying the current profile, which removes all IPv4 rules.
no_ipv4	Specifies removing all IPv4 rules: "enable" or "disable" (default is disabled).
no-ipv6	Specifies modifying the current profile, which removes all IPv6 rules.
no_ipv6	Specifies removing all IPv6 rules: "enable" or "disable" (default is disabled).

no-l2	Modify the current profile that removes all L2 rules. L2 ether rules are accounted for in the first available space from IPv4, IPv6, or MAC group.
no_l2	Modifier that removes all L2 rules: enable or disable (default is disabled).

Default

By default, the profile modifier is none.

By default, the profile modifier **no-l2** is disabled.

Usage Guidelines

You cannot configure the system to use a new resource profiles while policy is enabled. You must disable policy first.

You cannot configure the system to use a new resource-profile where the profile does not fit with existing defined rules. An error message similar to the following appears:

```
Current IPv6 rule usage 1 is higher than max value 0 supplied by profile more-mac-no-ipv6
```

Example

The following example configures the system to use the resource settings of more-ipv4-no-ipv6:

```
configure policy resource-profile more-ipv4-no-ipv6
```

History

This command was first available in ExtremeXOS 22.1.

Profile modification ability was added in ExtremeXOS 22.4.

The profiles **more-ipv4-no-mac-no-ipv6** and **less-acl-more-ipv4-no-mac-no-ipv6** were added in ExtremeXOS 22.4.

The profiles **more-ipv4-no-l2** and **more-ipv4-no-mac-no-ipv6-no-l2**, and profile modifier **no-l2** were added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy rule

configure policy rule *profile_index* [{**app-signature group** *group* **name** *name*} | **ether** *ether* | **icmp6type** *icmp6type* | **icmptype** *icmptype* | **ip6dest** *ip6dest* |**ipdestsocket** *ipdestsocket* | **ipfrag** | **ipproto** *ipproto* | **ipsourcesocket** *ipsourcesocket* | **iptos** *iptos* | **ipttl** *ipttl* |

macdest *macdest* | **macsource** *macsource* | **port** *port* | **tcpdestportIP** *tcpdestportIP* | **tcpsourceportIP** *tcpsourceportIP* | **udpdestportIP** *udpdestportIP* | **udpsourceportIP** *udpsourceportIP*] {**mask** *mask* } {**port-string** [*port_string* | **all**]} {**storage-type** [**non-volatile** | **volatile**]} {**drop** | **forward**} {**syslog** *syslog*} {**trap** *trap*} {**cos** *cos* } {**mirror-destination** *control_index*} {**clear-mirror**}

Description

Use this command to assign incoming untagged frames to a specific policy profile and to *VLAN* or *CoS* classification rules.

Syntax Description

port	Port string.
port	Port string - (data: 1; mask: 16).
app-signature	Associates an application signature to a policy profile.
group	Associates an application signature group to a policy profile
group	Specifies the group name.
name	Associates an application signature name to a policy profile.
name	Specifies the display name assigned to the application signature. Maximum of 32 characters. To see name choices, use the `show policy` **app-signature group** {*group* {**name** *name*}} {**built-in**	**custom** {**detail**}	**detail**} command.
macsource	MAC source address.
macsource	MAC source address - (data: a-b-c-d-e-f; mask: 1-48).
macdest	MAC destination address.
macdest	MAC destination address - (data: a-b-c-d-e-f; mask: 1-48).
ip6dest	IPv6 address.
ip6dest	IPv6 address (data: aaaa::bbbb; mask 1-128).
ipsourcesocket	Source IP address / Source IpSocket.
ipsourcesocket	Source IP address (data: a.b.c.d[:ab (0-65535)[-cd (0-65535)]]; mask: 1-48, 64).
ipdestsocket	Destination IP address / Destination IpSocket.
ipdestsocket	Destination IP address (data: a.b.c.d[:ab (0-65535) [-cd (0-65535)]]; mask: 1-48,64).
ipfrag	IP fragmentation flag.
tcpdestportIP	TCP port dst with optional post-fix IPv4 address.
tcpdestportIP	TCP port dst with optional post-fix IPv4 address - (data: ab[-cd] [:c.d.e.f]); mask: 1-64).
udpdestportIP	UDP port dst with optional post-fix IPv4 address.

udpdestportIP	UDP port dst with optional post-fix IPv4 address - (data: ab[-cd] [:c.d.e.f]); mask: 1-64.
tcpsourceportIP	TCP port src with optional post-fix IPv4 address.
tcpsourceportIP	TCP port src with optional post-fix IPv4 address - (data: ab[-cd] [:c.d.e.f]); mask: 1-64.
udpsourceportIP	UDP port src with optional post-fix IPv4 address.
udpsourceportIP	UDP port src with optional post-fix IPv4 address - (data: ab[-cd] [:c.d.e.f]); mask: 1-64.
ipttl	IP time to live.
ipttl	ipttl IP time to live (data: 0-255 or 0x0-0xFF; mask:1-8).
iptos	IPv4 type of service / IPv6 traffic class field.
iptos	ipproto Protocol field in IP packet - (data: 0-255 or 0x0-0xFF; mask: 1-8).
ipproto	Protocol field in IP packet.
ipproto	Protocol field in IP packet - (data: 0-255 or 0-0xFF; mask: 1-8).
ether	Type field in Ethernet II packet.
ether	Type field in Ethernet II packet - (data: 0-65535 or 0x0-0xFFFF; mask: 1-16).
icmp6type	Specifies type code in ICMPv6 packet.
icmp6type	ICMPv6 type code [(data: 123.456 (dotted-decimal) or AB-CD (dashed-hexadecimal)] mask: 1–16).
icmptype	Specifies type code in ICMP packet.
icmptype	ICMP type code (data: a.b; mask: 1–16).
cos	Class of Service [0–255] or -1 for no CoS or forwarding behavior modification is desired
cos	Class of Service [0–255] or -1 for no CoS or forwarding behavior modification is desired.
mirror-destination	Specifies selecting a mirror destination control index.
mirror-destination	Selects the mirror destination control index. Range is 1 to 4.
clear-mirror	Clears mirroring on this rule.
syslog	Specifies setting a Syslog action when rule is used.
syslog	Enable/disable/prohibit Syslog using event Policy.LogRuleHit on first rule use. By default, a Syslog entry only occurs on the first use of the rule. You can change this using the `configure policy` **syslog** [**machine-readable** *machine_readable* | **extended-format** *extended_format* | **every-time** *every_time*] command.
trap	Specifies setting a trap action when rule is first used.
trap	Enable/disable/prohibit trap on first rule use.

Default

- If mask is not specified, all data bits are considered relevant.
- If port-string is not specified, rule is scoped to all ports.
- By default, a Syslog or trap entry only occurs on the first use of the rule.

Usage Guidelines

Classification rules are automatically enabled when created.

Note

ExtremeSwitching X440-G2 and X620 series switches do not support macsource, macdest, or ip6dest classification rule types. Example:

```
# configure policy rule 1 macsource 00-00-00-00-00-01 port-string 3 drop
ERROR: Set failed!
```

Note

The ExtremeSwitching X870 does not support a port-string with the ip6dest classification rule type.

Example

This example shows how to create (and enable) a classification rule to associate with policy number 1. This rule will drop Ethernet II Type 1526 frames:

```
# configure policy rule 1 ether 1526 drop
```

This example shows how to create (and enable) a classification rule to associate with policy profile number 5. This rule specifies that UDP frames from source port 45 will be forwarded:

```
# configure policy rule 5 udpsourceportip 45 forward forward
```

The following example associates the application signature with group "Storage and name "mike1" to policy rule "2" to block traffic:

```
# configure policy rule 2 app-signature group "Storage" name "mike1" drop
```

History

This command was first available in ExtremeXOS 16.1.

ICMP and ICMPv6 rule types added in ExtremeXOS 22.5.

Applying mirrors to policies and Syslog/trap actions on rule use was added in ExtremeXOS 30.2.

Application signature capability was added in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy rule admin-profile

```
configure policy rule admin-profile [ macsource macsource | port port ]
   {mask mask } {port-string [port_string | all] } {storage-type [non-
   volatile | volatile]} {admin-pid admin_pid }
```

Description

Use this command to assign incoming untagged frames to a specific policy profile and to *VLAN* or Class-of-Service classification rules.

Syntax Description

admin-profile	Policy ID of 0.
macsource	MAC source address.
macsource	MAC source address - (data: a-b-c-d-e-f; mask: 1-48).
port	Port string.
port	Port string - (data: 1; mask: 16).
mask	Number of most significant bits to match data value (rule-meaning)
mask	Number of most significant bits to match data value (rule-meaning). Range: 1 - 144.
port-string	Rule port scope.
port-string	Rule port scope.
all	Scope to all ports.
storage-type	Storage type of this rule.
non-volatile	This entry shall be added to non-volatile storage.
volatile	This entry shall be removed from volatile storage.
admin-pid	Policy ID (1-63).
admin-pid	Policy ID (1-63).

Default

- If mask is not specified, all data bits will be considered relevant.
- If port-string is not specified, rule will be scoped to all ports.

Usage Guidelines

Classification rules are automatically enabled when created.

Example

This example shows how to configure classification rule 2 as an administrative profile and assign it to ingress port 1:1:

```
configure policy rule admin-profile port 1:1 port-string 1:1 admin-pid 2
```

History

This command was first available in ExtremeXOS release 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy rule-model

```
configure policy rule-model [access-list | hierarchical]
```

Description

Selects the rule model type for configuring policy rules.

Syntax Description

rule-model	Selects a rule model for configuring and ordering policy-based rules.
access-list	Selects access-list rule model, which allows multiple match criteria per rule along with assignable rule ordering within an access-list.
hierarchical	Selects hierarchical rule model, which allows one match criteria per rule and uses the rule type to assign its precedence (default).

Default

The factory default for rule model is hierarchical.

However, if you are upgrading to ExtremeXOS 30.5 or later, and the switch has an existing policy rules configuration, then the rule model remains hierarchical.

Usage Guidelines

To configure rule models, policy must be disabled.

If you change rule models, the configuration of the other rule model is deleted.

Example

The following example sets the rule model to hierarchical:

```
# configure policy rule-model hierarchical
```

History

This command was first available in ExtremeXOS 30.5.

The default rule model was changed from "access list" to "hierarchical" in ExtremeXOS 30.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy slices shared

```
configure policy slices shared [{ shared } { l7GuaranteedPercentage
   l7GuaranteedPercentage } { dynAclGuaranteedPercentage
   dynAclGuaranteedPercentage}]
```

Description

Configures the number of slices used by shared features, such as Layer 7 policy and dynamic *ACL*.

Syntax Description

slices	Configures look-up stage TCAM resources.
shared	Designates setting the shared lookup stage TCAM resources.
shared	Sets the shared slice value (range is 0–4).
l7GuaranteedPercentage	Designates setting the percentage of shared slice that Layer 7 is guaranteed. Note: The ExtremeSwitching X435 platform does not support Layer 7 policy (DNS).
l7GuaranteedPercentage	Specifies the guaranteed Layer 7 percentage value (range is 0–100).
dynAclGuaranteedPercentage	Designates setting the percentage of shared slice that is dynamic ACL guaranteed.
dynAclGuaranteedPercentage	Specifies the guaranteed dynamic ACL percentage value (range is 0–100).

Default

N/A.

Usage Guidelines

To make changes using this command, you must first disable policy (`disable policy`).

To view selections made by this command, use the `show policy` **`slices`** command.

Example

The following example configures policy to use 2 slices for shared features and allocate a guaranteed 40% to Layer 7 and 40% to dynamic ACLs:

```
# configure policy slices shared 2 l7GuaranteedPercentage 40 dynAclGuaranteedPercentage 40
```

History

This command was first available in ExtremeXOS 30.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy slices tci-overwrite

`configure policy` **`slices`** {**`shared`** *`shared`*} {**`tci-overwrite`** *`slices`*}

Description

Configures the number of slices used by a profile in the look-up stage TCAM resources.

Syntax Description

`slices`	Configures look-up stage TCAM resources.
`tci-overwrite`	Configures look-up Stage TCAM resources used by profile with tci-overwrite enabled. Note: The ExtremeSwitching X435 platform does not support TCI-overwrite.
`slices`	Specifies the number of slices between 0 and 4. The default is 4.
`shared`	Configures look-up stage TCAM resources.
`shared`	Specifies the shared slice value (0–4).

Default

By default, the number of slices is 4.

Usage Guidelines

This command only runs if policy is disabled.

This command enables you to allocate only the slice resources necessary and allow the rest to be used outside of policy. In a stack with slots having differing VCAP slice depths, each slot has the number of rules available as follows: `numSlices * (VCAP slice depth))`.

Example

The following example configures policy to use 3 slices with tci-overwrite enabled:

```
# configure policy slices tci-overwrite 3
```

History

This command was first available in ExtremeXOS 30.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy syslog

```
configure policy syslog [machine-readable machine_readable | extended-
   format extended_format | every-time every_time]
```

Description

Sets Syslog parameters for policy rules.

Syntax Description

syslog	Sets Syslog parameters for policy rules.
machine-readable	Sets whether hexadecimal or decimal format is used for Syslog messages.
machine_readable	Sets whether hexadecimal or decimal format is used for Syslog messages: "enable" (= hexadecimal) or "disable" (= decimal). Default is disabled (decimal).
extended-format	Sets whether extended format is used for Syslog messages.
extended_format	Sets whether extended format is used for Syslog messages: "enable" (= extended) or "disable" (= not extended). Default is disabled (not extended).
every-time	Sets whether Syslog messages are sent every time a rule is used (not just first time).
every_time	Sets whether Syslog messages are sent every time a rule is used (not just first time): "disable" or "enable". Default is disabled.

Default

By default, Syslog messages are only sent on first use of a rule.

By default, **extended-format** and **machine-readable** are disabled (not extended and in decimal format).

Usage Guidelines

This command allows you to set parameters for Syslog messages that are sent when a policy rule is used when set up in the command `configure policy rule` *profile_index* [{**app-signature group** *group* **name** *name*} | **ether** *ether* | **icmp6type** *icmp6type* | **icmptype** *icmptype* | **ip6dest** *ip6dest* |**ipdestsocket** *ipdestsocket* | **ipfrag** | **ipproto** *ipproto* | **ipsourcesocket** *ipsourcesocket* | **iptos** *iptos* | **ipttl** *ipttl* | **macdest** *macdest* | **macsource** *macsource* | **port** *port* | **tcpdestportIP** *tcpdestportIP* | **tcpsourceportIP** *tcpsourceportIP* | **udpdestportIP** *udpdestportIP* | **udpsourceportIP** *udpsourceportIP*] {**mask** *mask* } {**port-string** [*port_string* | **all**]} {**storage-type** [**non-volatile** | **volatile**]} {**drop** | **forward**} {**syslog** *syslog*} {**trap** *trap*} {**cos** *cos* } {**mirror-destination** *control_index*} {**clear-mirror**} .

When Syslog messages are configured to be sent every time a rule is used, messages are sent at a maximum rate of once every five seconds.

To view the parameters configured by this command, use the command `show policy` **syslog** {**machine-readable**} {**extended-format**} {**every-time**}.

Example

The following example sets Syslog messages to be sent every time a rule is used:

```
#configure policy syslog every-time enable
```

History

This command was first available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy vlanauthorization

`configure policy vlanauthorization` [**enable** | **disable**]

Description

This command enables or disables the configuration of *VLAN* Authorization-specific settings.

Syntax Description

enable	Enable VLAN Authorization.
disable	Disabel VLAN Authorization

Default

N/A.

Usage Guidelines

None.

Example

This example shows how to enable VLAN Authorization:

```
X450G2-48t-10G4.4 # configure policy vlanauthorization enable
```

History

This command was first available in ExtremeXOS 16.1

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure policy vlanauthorization port

```
configure policy vlanauthorization port [ port_list | all ] [{enable |
   disable} {tagged | untagged } ]
```

Description

This command configures *VLAN* Authorization for a port, port list, or all ports.

Syntax Description

port_list	List of ports to configure.
all	Configure all ports.
enable	Enable VLAN Authorization on port.
disable	Disable VLAN Authorization on port.
tagged	Add port to egress of the VLAN-ID returned.
untagged	Add port to the untagged egress of the VLAN-ID returned.

Default

N/A.

Usage Guidelines

None.

Example

This example shows how to enable VLAN Authorization for port 1:1 for tagged packets:

```
X450G2-48t-10G4.5 # configure policy vlanauthorization port 1:1 enable tagged
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure port description-string

`configure ports` *`port_list`* **`description-string`** *`string`*

Description

Configures a description string setting up to 255 characters.

Syntax Description

`port_list`	Specifies one or more ports or slots and ports.
`string`	Specifies a port description of up to 255 characters per port. You cannot use the following characters: ‘ “ ‘, “<”, “>”, “:”, “<space>”, “&”

Default

None.

Usage Guidelines

Use this command to configure a port description of up to 255 characters per port.

In case that user configures a string longer than 64 chars, the following warning will be displayed:

```
Port description strings longer than 64 chars are only accessible
through SNMP if the following command is issued: configure snmp ifmib
ifalias size extended
```

Some characters are not permitted as they have special meanings. These are: ‘ “ ‘, “<”, “>”, “:”, “<space>”, “&”. The first character should be alphanumeric. This new field is CLI accessible only via “show port info detail” but is also accessible via the *SNMP* ifAlias object of IfXTable from IF-MIB (RFC 2233) and the XML API. In order to access the value via SNMP the following command should be issued: `configure snmp ifmib ifalias size extended`.

Example

The following command configures the port:

```
configure ports 1:3 description-string CorporatePort_123
```

History

This command was available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure port ethertype

```
configure port port_list ethertype {primary | secondary}
```

Description

Assigns the primary or secondary ethertype value to the specified ports.

Syntax Description

port_list	Specifies the list of ports to be configured.
primary	Assigns the primary ethertype value to the specified ports.
secondary	Assigns the secondary ethertype value to the specified ports.

Default

N/A.

Usage Guidelines

None.

Example

The following example configures port 2:1 to use the secondary ethertype:

```
configure port 2:1 ethertype secondary
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure port reflective-relay

```
configure port port reflective-relay [on | off]
```

Description

Enables the direct attach feature on the specified port.

Syntax Description

port	Specifies a single port on which to enable the direct attach feature.

Default

Off.

Usage Guidelines

You should only enable the direct attach feature on ports that directly connect to a VM server running VEPA software.

This feature requires installation of the Direct Attach feature pack. For more information, see the *Switch Engine 32.2 Feature License Requirements* document..

Example

The following command enables the direct attach feature on port 2:1:

```
# configure port 2:1 reflective-relay on
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure port shared-packet-buffer

```
configure port port_list shared-packet-buffer [percent | default]
```

Description

Configures the maximum amount of the shared packet buffer to be used by the specified ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
percent	Specifies the maximum portion of the shared packet buffer to allot. The range is 0 to 100 percent.

Note

On some platforms, the hardware provides a limited number of settings. In these cases, ranges of percentage values achieve the same setting.

Note

You can view the configured percentage value using the `show ports` *`port-list`* `info detail` command.

Note

You can view the effect of this command using the `show ports` *`port-list`* `buffer` command.

Default

None.

Usage Guidelines

It is possible to overcommit the shared packet buffer using this command.

Example

The following command sets the shared packet buffer for port 1:1 to 50%:

```
configure port 1:1 shared-packet-buffer 50
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports

`configure ports {`**`group`**`}` *`port_group`* `[[` **`add`** `|` **`delete`** `]` *`port_list`* `]`

Description

Creates or deletes a generic port-group name that can be associated with a list of ports.

Syntax Description

group	Named list of ports.
port_group	Port group name.
add	Add ports to port group.
delete	Delete ports from port group.
port_list	Specifies a port list.

Default

N/A.

Usage Guidelines

Use this command to add or delete a generic port-group name to a list of ports.

Note

Because port-groups may be configured for multiple applications, no check is done other than that the values entered are ports. Individual applications handle illegal actions on ports as necessary. QoS commands that use port groups are updated automatically if the ports group is removed or if ports are added or removed from the group.

Example

```
configure ports group testGroup add 1-5
configure ports testGroup delete 3
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports auto off

```
configure ports port_list {medium [copper | fiber]} auto off speed speed
   duplex [half | full]
```

Description

Manually configures port speed and duplex setting configuration on one or more ports on a switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
medium	Specifies the medium as either copper or fiber. Note: This parameter applies to combo ports..
speed	Specifies the port speed as either 10, 100, 1,000 (1 Gigabit), 2,500 (2.5 Gigabit), 5,000 (5 Gigabit), 10,000 (10 Gigabit), 25,000 (25 Gibabit), 40,000 (40 Gigabit), 50,000 (50 Gigabit), or 100,000 (100 Gigabit) Mbps ports.
duplex [half]	Specifies half duplex; transmitting and receiving data one direction at a time.
duplex [full]	Specifies full duplex; transmitting and receiving data at the same time.

Default

Auto on for 1G and 10G copper ports.

Auto off for 25G, 40G, 50G, and 10,00G ports.

Usage Guidelines

You can manually configure the duplex setting and the speed on 10/100 and 10/100/1000 Mbps and fiber SFP gigabit Ethernet ports.

In general, SFP gigabit Ethernet ports are statically set to 1 Gbps, and their speed cannot be modified. However, there are SFPs supported by Extreme Networks that can have a configured speed:

- 100 FX SFPs, which must have their speed configured to 100 Mbps.
- 100FX/1000LX SFPs, which can be configured at either speed.
- SFP+ optics, must have their speed configured to 10G auto off.

In certain interoperability situations, it is necessary to turn autonegotiation off on a fiber gigabit Ethernet port. Even though a gigabit Ethernet port runs only at full duplex and gigabit speeds, the command that turns off autonegotiation must still include the duplex setting.

Gigabit Ethernet ports support flow control only when autonegotiation is turned on. When autonegotiation is turned off, flow control is not supported. For more detailed information about flow control on Extreme Networks devices, see the *Switch Engine 32.2 User Guide*.

When configuring combination ports you can specify the medium as copper or fiber. If the medium is not specified for combination ports then the configuration is applied to the current primary

medium. The current primary medium is displayed in the Media Primary column of the `show ports configuration` command output.

Note

The keyword medium is used to select the configuration medium for combination ports. If the port_list contains any non-combination ports, the command is rejected.

When upgrading a switch running ExtremeXOS 12.3 or earlier software to ExtremeXOS 12.4 or later, saved configurations from combo ports (copper or fiber) are applied only to combo ports fiber medium. When downgrading from ExtremeXOS 12.4 or later to ExtremeXOS 12.3 or earlier, saved configurations from combo ports (copper or fiber) are silently ignored. Therefore, you need to reconfigure combo ports during such an upgrade or downgrade.

Example

The following example turns autonegotiation off for port 2 with copper medium and a port speed of 100 Mbps at full duplex:

```
configure ports 2 medium copper auto off speed 100 duplex full
```

History

This command was first available in ExtremeXOS 10.1.

The **medium** parameter was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports auto on

```
configure ports port_list {medium [copper|fiber]} auto on {[{speed
   speed} {duplex [half | full]}] | [{duplex [half | full]} {speed
   speed}]}
```

Description

Enables autonegotiation for the particular port type.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
medium	Specifies the medium as either copper or fiber. Note: This parameter applies to combo ports.
speed	Specifies the port speed as either 10, 100, 1,000 (1 Gigabit), 2,500 (2.5 Gigabit), 5,000 (5 Gigabit), 10,000 (10 Gigabit), 25,000 (25 Gibabit), 40,000 (40 Gigabit), 50,000 (50 Gigabit), or 100,000 (100 Gigabit) Mbps ports.

duplex [half]	Specifies half duplex; transmitting and receiving data one direction at a time.
duplex [full]	Specifies full duplex; transmitting and receiving data at the same time.

Default

Auto on for 1G and 10G copper ports.

Auto off for 25G, 40G, 50G, and 10,00G ports.

Usage Guidelines

The type of ports enabled for autonegotiation are 802.3u for 10/100 Mbps ports or 802.3z for gigabit Ethernet ports.

Flow control on gigabit Ethernet ports is enabled or disabled as part of autonegotiation. If autonegotiation is set to off, flow control is disabled. When autonegotiation is turned on, flow control is enabled. See the *Switch Engine 32.2 User Guide* for more detailed information on flow control on Extreme Networks devices.

When configuring combo ports you can specify the medium as copper or fiber. If the medium is not specified for combination ports then the configuration is applied to the current primary medium. The current primary medium is displayed in the Media Primary column of the `show ports configuration` command output.

Note

The keyword medium is used to select the configuration medium for combination ports. If the port_list contains any non-combination ports, the command is rejected.

When upgrading a switch running ExtremeXOS 12.3 or earlier software to ExtremeXOS 12.4 or later, saved configurations from combo ports (copper or fiber) are applied only to combo ports fiber medium. When downgrading from ExtremeXOS 12.4 or later to ExtremeXOS 12.3 or earlier, saved configurations from combo ports (copper or fiber) are silently ignored. Therefore, you need to reconfigure combo ports during such an upgrade or downgrade.

Release 32.2 supports a 2.5G connection between ExtremeSwitching X435 uplink ports and 5520-24X front panel ports This feature also supports connecting a 5520-24X to another 5520-24X at 2.5G. Use of this feature requires 10G-SR-SFP300M-ET and 10G-LR-SFP10KM-ET 10G transceivers.

Note

For switches that do not support half-duplex (the ExtremeSwitching 5520-12MW-36W multi-rate ports), the copper switch ports must have auto negotiation disabled and full duplex enabled when connecting 10/100/1000 Mbps devices that do not auto negotiate. If the switch attempts and fails to auto negotiate with its partner, it will fail to link up. A non-negotiating connected device must also be manually configured for full duplex or packet loss and port errors will occur each time it detects a collision.

Note

1G auto negotiation is not supported in 5420-YE and 5420-XE ports.

Note
10G auto negotiation is supported in 5420 switches while using SFP+ passive copper cables.

Note
2.5G support for X435 and 5520-24X is only available with auto-negotiation disabled.

Example

The following example configures the switch to auto-negotiate for port 2, with copper medium at a port speed of 100 Mbps at full duplex:

```
# configure ports 2 medium copper auto on speed 100 duplex full
```

History

This command was first available in ExtremeXOS 10.1.

The **speed** and **duplex** parameters were added in ExtremeXOS 11.6.

The **medium** parameter was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports auto-polarity

```
configure ports port_list auto-polarity [off | on]
```

Description

Configures the autopolarity detection feature on the specified Ethernet ports.

Syntax Description

port_list	Specifies one or more ports on the switch.
off	Disables the autopolarity detection feature on the specified ports.
on	Enables the autopolarity detection feature on the specified ports.

Default

Enabled.

Usage Guidelines

This feature applies to only the 10/100/1000 BASE-T ports, and copper medium on combination ports.

When autopolarity is disabled on one or more Ethernet ports, you can verify that status by using the following command:

```
# show ports information detail
```

Example

The following command disables the autopolarity detection feature on ports 5 to 7 on a switch:

```
# configure ports 5-7 auto-polarity off
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports ddmi

```
configure ports [port_list | all] ddmi [on | off]
```

Description

Enables or disables Digital Diagnostic Monitoring Interface (DDMI).

Syntax Description

port_list	Designates the ports to enable or disable DDMI on.
all	Designates enabling or disabling DDMI on all ports.
ddmi	Designates enabling or disabling DDMI on specified ports.
on	Specifies enabling DDMI on the selected ports (default).
off	Specifies disabling DDMI on the selected ports.

Default

By default, DDMI is enabled.

Usage Guidelines

DDMI provides critical system information about the installed optical modules.

Example

The following example disables DDMI on port 1:

```
# configure ports 1 ddmi off
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports display-string

```
configure ports port_list display-string string
```

Description

Configures a user-defined string for a port or group of ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
string	Specifies a user-defined display string.

Default

The null string is the default.

Usage Guidelines

The display string can be up to 15 characters. Display strings do not need to be unique for each port—you can assign the same string to multiple ports. For example, you could give all the ports that connected to a particular department a common display string.

The string is displayed in certain commands such as the `show ports information` command.

Note

Do not use a port number as a display string. For example, do not assign the display string “2” to port2.

Example

The following command configures the user-defined string corporate for port 1 on a stand-alone switch:

```
configure ports 1 display-string corporate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports dot1p

```
configure ports [port_list | all] dot1p dot1p_priority
```

Description

This command configures the default dot1p priority to be used for the internal priority for untagged traffic on the specified port.

Syntax Description

port_list	Specifies a port list.
all	Specifies all ports.
dot1p_priority	Priority number from 0 to 7 to be used for untagged packets.

Default

0.

Usage Guidelines

Use this command to configure the default dot1p priority to be used for the internal priority for untagged traffic on the specified port. This priority is used for untagged frames when dot1p examination is enabled on a port.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports dwdm channel none

```
configure port all | port_list dwdm channel none
```

Description

Configures the default DWDM channel number.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Channel number - 21.

Usage Guidelines

Use this command to configure the default DWDM channel number to the DWDM optical module inserted in the given port. This default channel number of 21 and will be mapped to the appropriate corresponding channel number of the vendor specific channel. If a non-tunable DWDM optic is present, then the DWDM configuration is silently removed from the software.

Example

The following command configures the default DWDM channel 21 on supported port 1:

```
configure port 1 dwdm channel none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports dwdm channel

configure port **all** | *port_list* **dwdm channel** *channel_number*

Description

Selects the DWDM channel frequency for the selected ports.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.
channel_number	Specifies the channel number, which corresponds to one of 102 available channel frequencies.

Default

Channel number – 21.

Usage Guidelines

The following table lists the available frequencies and the channel number you must specify to select each frequency.

Table 16: TX Wavelengths and Channel Assignments for the Tunable DWDM XFP/SPF+

TX Wavelength	Channel	TX Wavelength	Channel	TX Wavelength	Channel	TX Wavelength	Channel
1568.77 nm	11	1558.17 nm	24	1547.72 nm	37	1537.40 nm	50
1568.36 nm	1150	1557.77 nm	2450	1547.32 nm	3750	1537.00 nm	5050
1567.95 nm	12	1557.36 nm	25	1546.92 nm	38	1536.61 nm	51
1567.54 nm	1250	1556.96 nm	2550	1546.52 nm	3850	1536.22 nm	5150
1567.13 nm	13	1556.55 nm	26	1546.12 nm	39	1535.82 nm	52
1566.72 nm	1350	1556.15 nm	2650	1545.72 nm	3950	1535.43 nm	5250
1566.31 nm	14	1555.75 nm	27	1545.32 nm	40	1535.04 nm	53
1565.90 nm	1450	1555.34 nm	2750	1544.92 nm	4050	1534.64 nm	5350
1565.50 nm	15	1554.94 nm	28	1544.53 nm	41	1534.25 nm	54
1565.09 nm	1550	1554.54 nm	2850	1544.13 nm	4150	1533.86 nm	5450
1564.68 nm	16	1554.13 nm	29	1543.73 nm	42	1533.47 nm	55
1564.27 nm	1650	1553.73 nm	2950	1543.33 nm	4250	1533.07 nm	5550
1563.86 nm	17	1553.33 nm	30	1542.94 nm	43	1532.68 nm	56
1563.45 nm	1750	1552.93 nm	3050	1542.54 nm	4350	1532.29 nm	5650
1563.05 nm	18	1552.52 nm	31	1542.14 nm	44	1531.90 nm	57
1562.64 nm	1850	1552.12 nm	3150	1541.75 nm	4450	1531.51 nm	5750
1562.23 nm	19	1551.72 nm	32	1541.35 nm	45	1531.12 nm	58
1561.83 nm	1950	1551.32 nm	3250	1540.95 nm	4550	1530.72 nm	5850
1561.42 nm	20	1550.92 nm	33	1540.56 nm	46	1530.33 nm	59
1561.01 nm	2050	1550.52 nm	3350	1540.16 nm	4650	1529.94 nm	5950
1560.61 nm	21	1550.12 nm	34	1539.77 nm	47	1529.55 nm	60
1560.20 nm	2150	1549.72 nm	3450	1539.37 nm	4750	1529.16 nm	6050
1559.79 nm	22	1549.32 nm	35	1538.98 nm	48	1528.77 nm	61
1559.39 nm	2250	1548.91 nm	3550	1538.58 nm	4850	1528.38 nm	6150
1558.98 nm	23	1548.51 nm	36	1538.19 nm	49		
1558.58 nm	2350	1548.11 nm	3650	1537.79 nm	4950		

The supported channel numbers are not contiguous. If you specify a channel number that is not listed in the preceding table, the following error message appears:

```
Error: DWDM Channel configuration failed. Channel number 100 is out of
configurable range. The channel range for the Optical module in port
<port number> is 11 .. 6150.
```

If the optical module in one of the ports in the specified list does not support DWDM, the following error message is displayed:

```
Error: No TDWDM Optics on port <port number>.
```

If the optical module in one of the ports in the specified port list is not an Extreme supported optical module, the following error message is displayed:

```
Error: DWDM Channel configuration failed. Optical module is not Extreme
Networks certified. For DWDM channel configuration, Extreme Network
Certified DWDM module is required.
```

To display the configuration, use the `show ports configuration` or the `show ports information` detail command.

Example

The following command configures DWDM channel 21 on a modular port 1:1:

```
configure port 1:1 dwdm channel 21
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports eee

```
configure ports port_list eee [on | off]
```

Description

Enables or disables EEE on the physical layer.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
on	Specifies that the port advertises to its link partner that it is EEE capable at certain speeds
off	Specifies that the port advertises to its link partner that it is not EEE capable at certain speeds

Default

Off.

Usage Guidelines

Use this command to enable EEE on the switch. The keyword **on** specifies that the port advertises to its link partner that it is EEE capable at certain speeds. If both sides, during auto-negotiation, determine that they both have EEE on and are compatible speed wise, they will determine other parameters (how long it takes to come out of sleep time, how long it takes to wake up) and the link comes up. During periods of non-activity, the link will shut down parts of the port to save energy. This is called LPI for low power idle. When one side sees it must send something, it wakes up the remote and then transmits.

Example

The following example turns the EEE feature on for port 2:

```
config port 2 eee on
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

EEE is supported on the following Extreme Networks platforms:

- ExtremeSwitching 5320, 5420, 5520, and 5720—copper 10/100/1000 and multi-rate ports

configure ports forward-error-correction

```
configure ports port_list forward-error-correction [off | on [cl74 |
   cl91]]
```

Description

Enables/disables IEEE Forward Error Correction (FEC) Clause 74 or 91 modes.

Syntax Description

port_list	List of ports to enable/disable FEC modes on.
forward-error-correction	Configures port FEC mode.
off	Disables all FEC modes (default).
on	Enables FEC modes.
c174	Enables/disables FEC IEEE Clause 74.
c191	Enables/disables FEC IEEE Clause 91.

Default

FEC is not enabled by default.

Usage Guidelines

This command allows you to enable/disable Clause 91 or Clause 74 (exclusively) on a per-port basis regardless of speed/type.

FEC gives the receiver the ability to correct errors without requiring a reverse channel to request retransmission of data, but at the cost of a fixed, higher forward channel bandwidth. Some devices require this to interoperate.

Example

The following example enables FEC Clause 91 on port 1:

```
# configure ports 1 forward-error-correction on cl91
```

The following example turns off FEC on port 1:

```
# configure ports 1 forward-error-correction off
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports ingress-filtering

`configure ports` *port_list* **mac-based-vlans ingress-filtering** [**on**|**off**]

Description

Allows users to toggle the ingress filtering setting for MAC-based VLANs.

Syntax Description

port_list	Specifies one or more ports, or slots and ports.
mac-based-vlans	Specifies MAC-based VLANs.
ingress-filtering	Specifies the configuration of ingress filtering when MAC-based VLANs are enabled.
on	Turns on ingress filtering. Enabling ingress filtering prevents VLANs other than those with egress membership from being forwarded.
off	Turns off ingress filtering. Disabling ingress filtering allows the forwarding of packets sourced from any VLAN. This is the default setting.

Default

The default is off.

Usage Guidelines

If the command is executed on a port that does not have MAC-based VLANs enabled, the command will be accepted, but it will not be applied until MAC-Based VLANs are enabled.

Example

The following command enables ingress filtering for ports 1:2:

```
# configure ports 1:2 mac-based-vlans ingress-filtering on
```

History

This command was first available in ExtremeXOS 31.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports isolation

`configure ports` *port_list* **isolation**[**on**|**off**]

Description

Enables isolation mode on a per-port basis.

Syntax Description

port_list	Specifies one or more ports, or slots and ports.
isolation	Specifies that Isolated ports are not allowed to inter-communicate.
on	Turns on isolation. Isolated ports are not allowed to inter-communicate.
off	Turns off isolation. This is the default setting.

Default

Isolation is off by default.

Usage Guidelines

Use this command to enable isolation mode on a per-port basis. You can issue the command on a single port or on a master port of a load share group. If you issue the command on a non-master port of a load share group the command will fail. When a port load share group is formed, all of the member ports assume the same isolation setting as the master port.

Example

The following command enables isolation mode on ports 2 and 4 on a switch:

```
configure ports 1, 4 isolation on
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports l2pt profile

```
configure [vlan | vman] vlan_name ports port_list l2pt profile [none |
   profile_name]
```

Description

Configures L2PT profiles on service interfaces.

Syntax Description

vlan	Specifies the *VLAN* configuration.
vman	Specifies the VMAN configuration.

vlan_name	Specifies the VLAN name.
ports *port_list*	Specifies the port and port list separated by a comma (,) or dash (-).
profile	Specifies the L2PT profile for the ports.
none	Specifies that no L2PT profile should be bound to the ports (default).
profile_name	Specifies the L2PT profile to be bound to the ports.

Default

Disabled.

Usage Guidelines

Use this command to configure L2PT profiles on service interfaces.

Example

The following example binds *my_l2pt_prof* with ports 2 and 5 of VMAN cust1:

```
configure vman cust1 ports 2,5 l2pt profile my_l2pt_prof
```

The following example binds *my_l2pt_prof* with ports 2 and 5 of VMAN cust1. Port 5 is not a part of VMAN cust1:

```
configure vman cust1 ports 2,5 l2pt profile my_l2pt_prof
Error: Port 5 is not part of the service.
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports link-flap-detection action

```
configure ports [port_list | all] link-flap-detection action [add |
   delete] [{{disable-port} {log} {trap}} | all-actions]
```

Description

Add or deletes actions (disabling ports, logging events, generating *SNMP* traps) to be taken when excessive link flapping is detected.

Syntax Description

ports	Physical ports.
port_list	List of ports to set link-flap detection actions upon.
all	Sets the configured action for link-flap detection upon all ports in the system.
action	Sets actions to be taken when excessive link flapping is detected.
add	Adds action(s).
delete	Deletes action(s).
disable-port	Disables selected ports if link-flap threshold is exceeded. After a port is disabled, the port either stays down for the configured disable time value (set in the `configure ports link-flap-detection interval threshold disable-time` command) or can be re-enabled manually using the `clear ports link-flap-detection status` command.
log	Generates a log event if link-flap threshold is exceeded.
trap	Generates an SNMP trap if link-flap threshold is exceeded.
all-actions	Adds or deletes all the actions.

Default

By default, all actions are turned off.

Example

The following example adds all link-flap actions (disabling ports, logging events, generating SNMP traps) on ports 3–10:

```
configure ports 3-10 link-flap-detection action add all-actions
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports link-flap-detection interval threshold disable-time

```
configure ports [port_list | all] link-flap-detection [{interval
   [interval | indefinitely]} {threshold threshold} {disable-time
   [disable_time | until-cleared]}]
```

Description

Sets interval, threshold (maximum number of link down events), and disable time values for link-flap detection.

Syntax Description

ports	Physical ports.
port_list	List of ports to activate link-flap detection upon.
all	Sets link-flap detection characteristics on all ports in the system.
interval	Sets time interval for collecting link-flap events.
interval	Interval value in seconds. Default is 5 seconds. Range is 1 second to indefinitely.
indefinitely	Accumulate link-flap instances forever.
threshold	Sets number of link-flap events tolerated before action is taken.
threshold	Threshold value. Default is 10. Minimum threshold is 1; maximum threshold value depends on the link-flap detection configured link-flap interval and the link scan interval.
disable-time	Sets time period a port remains disabled after detecting excessive link flapping.
disable_time	Disable time in seconds. Default is 300 seconds. Range is 1 seconds to until enabled by user.
until-cleared	Port remains down until you issue `clear ports [`*port_list* `|` **all**`] link-flap-detection status` command.

Default

These options have the following default values:

Option	Default Value
Interval	5 seconds
Threshold	10 link flaps
Disable time	300 seconds

Usage

If the default link-scan interval is 50 ms, then in 1 second, a maximum of 20 link state transitions (up or down) and 10 link down transitions can be detected. Assuming the link-flap interval is set to 5, the maximum link-flap threshold is 10 * 5 = 50. Maximum threshold for interval of 10 seconds appears in the output of the `show ports all link-flap configuration` command.

For example, the following sequence of commands generates an error message:

```
configure ports 7 link-flap-detection interval 5
configure ports 7 link-flap-detection threshold 200
Error: Maximum threshold is 100 for port 7 for current
configuration of link-flap interval of 5 seconds.
```

Similarly, if the current threshold is 50, default link-scan interval is 50 ms, and the interval is changed to 4 seconds, then an error message appears:

```
configure ports 7 link-flap-detection threshold 100
configure ports 7 link-flap-detection interval 2
Error: Current threshold of 100 for port 7 is invalid with
new interval value of 2 seconds. Threshold must be less
than 40 for interval to be 2 seconds.
```

Example

The following example sets the threshold value to 15 link flaps that can be accumulated in an infinite interval for all ports.

```
configure ports all link-flap-detection interval indefinitely threshold 15
```

History

This command was first available in ExtremeXOS release 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports link-flap-detection

configure **ports** [*port_list* | **all**] **link-flap-detection** [**on** | **off**]

Description

Turns on or off link-flap detection.

Syntax Description

ports	Physical ports.
port_list	List of ports to activate link-flap detection upon.
all	Activates link-flap detection on all port in the system.
on	Link-flap detection is on.
off	Link-flap detection is off.

Default

Link-flap detection is disabled by default.

Example

The following example turns off link-flap detection on ports 1–15:

```
Configure ports 1-15 link-flap-detection off
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports link-scan interval

```
configure ports link-scan interval [ milliseconds | default ] { slot
   [ slot | all ] }
```

Description

Configures the link-scan interval. The configure command allows the user to set the interval in a range between the default for the platform and 500 ms. A higher interval can free up CPU cycles when fast link detection is not a requirement.

Syntax Description

ports	Ports.
link-scan	Configure link scan attributes for polling port status.
interval	Configure amount of time between polling port status
milliseconds	Interval in milliseconds. Range is 50 to 500 for most platforms. The minimum interval depends on the default for the platform."; type="int"; range="[50,500]
default	Default interval (50 ms for most platforms).
slot	Slot number (default all slots)"; capability="slot_available"
all	All slots.

Default

50 ms.

Usage Guidelines

Use this command to configure the link-scan interval.

Example

```
# sh ports link-scan
Slot   Interval (ms)
-----  ---------------
    1     50 (default)
    2    300
    3     50 (default)
    4     50 (default)
```

```
    5
    6
    7
    8    200
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports monitor vlan

```
configure ports [port_list|all] monitor vlan [vlan_name | vlan_list]
   {rx-only | tx-only}
```

Description

Starts counting *VLAN* statistics on a port or a group of ports.

Syntax Description

port_list	Specifies one or more ports. May be in the form: 1, 2, 3-5, 2:5, 2:6-2:8.
all	Specifies all ports.
vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
rx-only	Specifies receive statistics.
tx-only	Specifies transmit statistics.

Default

N/A.

Usage Guidelines

Use this command to configure access to VLAN statistics per port.

The rx-only and tx-only parameters are intended for, but not restricted to, use on ports that support both receive and transmit statistics. Ports on slots that do not support transmit statistics do not require explicit use of the rx-only keyword. In the absence of specifying either rx-only or tx-only, both RX and TX VLAN statistics are gathered if both are supported on the configured port.

When both receive and transmit statistics are configured and resources for either receive or transmit are not available, neither receive nor transmit statistics will be configured.

The number of VLANs that can be monitored is dependent on filtering resources on the involved switch.

When per-port monitoring is configured, the following commands display the latest statistics directly from the hardware in real time. This information is not logged.

To display VLAN statistics at the port level, use the following command:

```
show ports {port_list} vlan statistics {no-refresh | refresh}
```

To display VLAN statistics at the VLAN level, use the following command:

```
show vlan {vlan_name | vlan_list} statistics
```

Example

The following example configures per-port monitoring of transmit statistics for a set of ports for the VLAN named finance on a switch:

```
configure ports 2,3 monitor vlan finance tx-only
```

History

This command was first available in ExtremeXOS 12.0.

Support for ExtremeSwitching switches was added in ExtremeXOS 12.5.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports partition

```
configure ports [port_list | all] partition [1x100G | 1x40G | 2x50G |
   4x10G | 4x25G]
```

Description

Partitions 100G and 40G ports into multiple partition speeds, and partitions 25G ports into a single 10G port for the ExtremeSwitching 5520 platform.

Syntax Description

port_list	Specifies one or more ports.
all	Specifies all ports.
1x100G	Specifies partitioning a 100G port into a single 100G port (applies only to switches with 100G port(s)). This option is not available on the ExtremeSwitching 5520 platform.

1x40G	Specifies partitioning a 40G port into a single 40G port (applies only to switches with 40G port(s)).
2x50G	Specifies partitioning a 100G port into a two 50G port (applies only to switches with 100G port(s)).
3x1G	Specifies partitioning a 5720-VIM-6YE into a three consecutive 1G ports. Apply **3x1G** option on the first VIM port (port 27 or 30 for 24-port models and ports 51 or 55 for 48-port models). All three ports (ports 27-29 or 30-32 for 24-port models and ports 51-53 and 54-56 on 48-port models) on the VIM become 1G ports when applying this option.
3x10G	Specifies partitioning a 5720-VIM-6YE into a three consecutive 10G ports. Apply **3x10G** option on the first VIM port (port 27 or 30 for 24-port models and ports 51 or 55 for 48-port models). All three ports (ports 27-29 or 30-32 for 24-port models and ports 51-53 and 54-56 on 48-port models) on the VIM become 10G ports when applying this option.
3x25G	Specifies partitioning a 5720-VIM-6YE into a three consecutive 25G ports. Apply **3x25G** option on the first VIM port (port 27 or 30 for 24-port models and ports 51 or 55 for 48-port models). All three ports (ports 27-29 or 30-32 for 24-port models and ports 51-53 and 54-56 on 48-port models) on the VIM become 25G ports when applying this option.
4x10G	Specifies partitioning a 40G port into a four 10G port (applies only to switches with 40G port(s)). Specifies partitioning a 25G port into a single 10G port. Apply **4x10G** option on the first 5520 VIM port (port 33 for 24-port models and port 57 for 48-port models). All four ports on the 5520 VIM become 10G ports when applying this option.
4x25G	Specifies partitioning a 100G port into a four 25G port. Also specifies changing a 25G port that was partitioned to a 10G port to back to 25G. Apply **4x25G** option on the first 5520 VIM port (port 33 for 24-port models and port 57 for 48-port models). All four ports on the 5520 VIM become 25G ports when applying this option.

Default

For 5520-VIM-4YE, 25G ports default to 1x25G.

For 5520 QSFP28 ports the default partition is 40G.

For 5720-VIM-2CE ports default to 1x100G.

For 5720-VIM-6YE ports default to 3x25G.

Usage Guidelines

For the ExtremeSwitching 5520 platform, the QSFP28 ports in Ethernet mode can be configured for 40G (default), 2x50G, 4x25G or 4x10G. These ports are normally configured for stacking. To use these for Ethernet, you must disable stacking support.

For the ExtremeSwitching 5520-VIM-4YE module you can switch all four ports on the VIM from 25G to 10G using the **4x25G** option.

Example

The following example partitions port 6:1 into four 10G ports:

```
# configure ports 6:1 partition 4x10G
```

History

This command was available in ExtremeXOS 12.6.

This command was expanded to include partitioning 100G ports in ExtremeXOS 22.2

Dynamic partitioning (no reboot required) was added in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5520 and 5720 switch models:

Table 17: QSFP28 Port Partitioning

Switch model	Port bandwidth	Port partitions
5520 (all models) QSFP28	100 Gb	One QSFP28 port with one of the following: • Two 50 Gb ports • One 40 Gb port (default) • Four 25 Gb ports • Four 10 Gb ports Note: These ports do not support 1x100Gb
5720 (all models) U1 and U2 ports	100Gb	One U1 or U2 port with one of the following: • One 40 Gb port • One 100 Gb port (default) • Two 50 Gb ports • Four 10 Gb ports • Four 25 Gb ports
5720-VIM-6YE	25G	The 5720-VIM-6YE has two speed groups, each with three ports that can be partitioned with the following: • Three 1 Gb ports • Three 10 Gb ports • Three 25 Gb ports (default)
5720-VIM-2CE	100G	The 5720-VIM-2CE has two ports, each of which can be partitioned with the following: • One 100 Gb port (default) • One 40 Gb port • Four 10 Gb ports • Four 25 Gb ports

configure ports protocol filter

```
configure ports [port_list | all] protocol filter [none | filter_name]
```

Description

Configures protocol filtering on a port.

Syntax Description

port_list	Specifies the port list separated by a comma (,) or dash (-).
all	Specifies all ports.
protocol filter	Specifies the protocol filter.
none	Specifies to not perform protocol filtering on specified ports.
filter_name	Specifies the protocol filter name.

Default

Disabled.

Usage Guidelines

Use this command to configure protocol filtering on a port.

Example

The following example unbinds the L2PT profile from peer 1.1.1.1 of VPLS cust2:

```
configure l2vpn vpls cust2 peer 1.1.1.1 l2pt profile none
```

The following example enables filtering of protocols in *my_list* on port 1:

```
configure ports 1 protocol filter "my_list"
```

The following example disables protocol filtering on port 7:

```
configure ports 7 protocol filter none
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports qosprofile

```
configure ports port_list {qosprofile} qosprofile
```

Description

Creates a port-based traffic group, which configures one or more ingress ports to use a particular egress QoS profile.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
qosprofile	Specifies a QoS profile.

Default

All ingress ports have the default qosprofile of QP1.

Usage Guidelines

This command assigns traffic ingressing the specified port to a specified egress QoS profile. Extreme switches support eight egress QoS profiles (QP1 to QP8) for each port. SummitStack does not permit configuration of QP7.

Example

The following command configures port 5 to use QoS profile QP3:

```
configure ports 5 qosprofile QP3
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports rate-limit egress

```
configure ports port_list rate-limit egress [no-limit | cir-rate [Kbps |
   Mbps | Gbps] {max-burst-size burst-size [Kb | Mb]}]
```

Description

Configures an egress traffic rate limit for a port or groups of ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
no-limit	Specifies traffic be transmitted without limit; use to reconfigure or unconfigure previous rate-limiting parameters.
cir-rate	Specifies the desired rate limit in Kbps, Mbps, or Gbps.
max-burst-size	Specifies the maximum burst size or peak burst size in kilobits (Kb) or megabits (Mb).

Default

No-limit.

Usage Guidelines

Port speed limits the egress traffic, as follows:

- 1 Gbps port—64 Kbps increments.
- 10 Gbps port—1 Mbps increments.

If the specified egress limit (cir-rate) is not a multiple of 64 Kbps for a 1 Gbps port or 1 Mbps for a 10Gbps port, the specified value is rounded down to the nearest appropriate multiple based on the port type.

Use the **no-limit** parameter to:

- Unconfigure egress rate limiting on the port(s).
- Reconfigure existing egress rate limiting on the port(s).

The max-burst-size parameter is the amount of traffic above the value in the cir-rate parameter that is allowed to burst from the port(s) for a short duration. If max-burst-size has been configured as "0", then it will use maximum available burst value.

Example

The following command configures egress rate-limiting on port 1 a switch for 3 Mbps and a maximum burst size or 5 M bits:

```
configure port 1 rate-limit egress 3 Mbps max-burst-size 5 Mb
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports rate-limit flood

```
configure ports [port_list | port_group]rate-limit flood [broadcast |
   multicast | unknown-destmac] [no-limit | pps {out-actions [{log}
   {trap} {disable-port}]}]]
```

Description

Limits the amount of ingress flooded traffic; minimizes network impact of broadcast loops.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a SummitStack, this value is the slot and port number.
port_group	Port group name.
broadcast	Specifies all broadcast packets.
multicast	Specifies all flooded multicast packets (known IP multicast caches are still forwarded at line rate).
unknown-destmac	Specifies all packets with unknown MAC DAs.
no-limit	Specifies unlimited rate.
pps	Packets per second allowed; range is from 0 to 262,144.
out-actions	Out-of-profile action.
log	Generate log event if traffic exceeds configured rate.
trap	Generate *SNMP* trap if traffic exceeds configured rate.
disable-port	Disable the underlying port when traffic exceeds configured rate.

Default

No limit.

Usage Guidelines

Use this command to limit the amount of ingress flooding traffic and to minimize the network impact of broadcast loops.

Note

When the **multicast** keyword is used, both known and unknown multicast traffic will be rate limited.

To display results, use the `show ports rate-limit flood` command.

Example

The following example rate limits broadcast packets on port 3 on a stand-alone switch to 500 pps:

```
configure ports 3 rate-limit flood broadcast 500
```

History

This command was available in ExtremeXOS 11.1.

The **out-actions**, **log**, **trap**, **disable-port**, and *port_group* options were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports redundant

configure ports *primaryPort* **redundant** *secondaryPort* {**link** [**on** | **off**]}

Description

Configures a software-controlled redundant port.

Syntax Description

primaryPort	Specifies one primary port or slot and port.
redundantPort *secondaryPort*	Specifies one or redundant port or slot and port.
link	Specifies state of link: on—Specifies keeping the redundant port active, but block trafficoff—Specifies forcing the link down on the redundant port Note: The default value is off.

Default

N/A.

Usage Guidelines

The first port specifies the primary port. The second port specifies the redundant port.

A software-controlled redundant port is configured to back up a specified primary port; both ports are on the same device. The redundant port tracks the link state of the associated primary port, and if the link on the primary port fails, the redundant port establishes a link and becomes active. You can back up a specified Ethernet port with a redundant, dedicated Ethernet port.

You configure the redundant link to be always physically up but logically blocked or to be always physically down. The default is off, or the redundant link is down.

The following criteria must be considered when configuring a software-controlled redundant port:

- You can configure only one redundant port for each primary port.
- You cannot have any Layer 2 protocols configured on any of the *VLAN*s that are present on the ports. (You will see an error message if you attempt to configure software redundant ports on ports with VLANs running Layer 2 protocols.)
- The primary and redundant port must have identical VLAN memberships.
- The master port is the only port of a load-sharing group that can be configured as either a primary or redundant port. (The entire trunk must go down before the software-controlled redundant port takes effect.)
- Only one side of the link should be configured as redundant.

Example

The following command configures a software-controlled redundant port:

```
configure ports 1:3 redundant 2:3
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ports vlan

```
configure ports port_list [ {tagged tag} vlan vlan_name | {tagged}
   vlan vlan_list ] [limit-learning number {action [blackhole | stop-
   learning]} | lock-learning | unlimited-learning | unlock-learning]
```

Description

Configures virtual ports for limited or locked MAC address learning.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
tagged *tag*	Specifies the port-specific *VLAN* tag. When there are multiple ports specified in the *port_list*, the same tag is used for all of them.
vlan_name	Specifies the name of the VLAN.
vlan_list	Specifies a VLAN list of IDs.

limit-learning *number*	Specifies a limit on the number of MAC addresses that can be dynamically learned on the specified ports.
blackhole	Specifies that blackhole entries are created for MAC addresses that exceed the limit-learning limit. This is the default setting.
stop-learning	Specifies that the learning be halted to protect the switch from exhausting *FDB* resources by not creating blackhole entries.
lock-learning	Specifies that the current FDB entries for the specified ports should be made permanent static, and no additional learning should be allowed.
unlimited-learning	Specifies that there should not be a limit on MAC addresses that can be learned.
unlock-learning	Specifies that the port should be unlocked (allow unlimited, dynamic learning).

Default

Unlimited, unlocked learning.

Usage Guidelines

If you have enabled *ESRP*, see the appropriate volume of the *Switch Engine 32.2 User Guide* for information about using this feature with ESRP.

Limited learning

The limited learning feature allows you to limit the number of dynamically-learned MAC addresses per VLAN. When the learned limit is reached, all new source MAC addresses are blackholed at both the ingress and egress points. This prevent these MAC addresses from learning and responding to *ICMP* and address resolution protocol (ARP) packets.

If the limit you configure is greater than the current number of learned entries, all the current learned entries are purged.

Dynamically learned entries still get aged, and can be cleared. If entries are cleared or aged out after the learning limit has been reached, new entries will then be able to be learned until the limit is reached again.

Permanent static and permanent dynamic entries can still be added and deleted using the `create fdb` and `delete fdb` commands. These override any dynamically learned entries.

For ports that have a learning limit in place, the following traffic still flows to the port:

- Packets destined for permanent MACs and other non-blackholed MACs.
- Broadcast traffic.
- *EDP* traffic.

Traffic from the permanent MAC and any other non-blackholed MACs will still flow from the virtual port.

If you configure a MAC address limit on VLANS that participate in an Extreme Standby Router Protocol (ESRP) domain, you should add an additional back-to-back link (that has no MAC address limit on these ports) between the ESRP-enabled switches. Doing so prevents ESRP protocol data units (PDUs) from being dropped due to MAC address limit settings.

Stop learning

When stop-learning is enabled with learning-limit configured, the switch is protected from exhausting FDB resources by not creating blackhole entries. Any additional learning and forwarding is prevented, but packet forwarding from FDB entries is not impacted.

Port lockdown

The port lockdown feature allows you to prevent any additional learning on the virtual port, keeping existing learned entries intact. This is equivalent to making the dynamically-learned entries permanent static, and setting the learning limit to zero. All new source MAC addresses are blackholed.

Locked entries do not get aged, but can be deleted like any other permanent FDB entries. The maximum number of permanent lockdown entries is 1024. Any FDB entries above will be flushed and blackholed during lockdown.

For ports that have lockdown in effect, the following traffic still flows to the port:

- Packets destined for the permanent MAC and other non-blackholed MACs.
- Broadcast traffic.
- EDP traffic.

Traffic from the permanent MAC will still flow from the virtual port.

Once the port is locked down, all the entries become permanent and will be saved across reboot.

When you remove the lockdown using the unlock-learning option, the learning-limit is reset to unlimited, and all associated entries in the FDB are flushed.

To display the locked entries on the switch, use the following command:

```
show fdb
```

Locked MAC address entries have the “l” flag.

To verify the MAC security configuration for the specified VLAN or ports, use the following commands:

```
show vlan vlan name security show ports port_list info detail
```

Example

The following example limits the number of MAC addresses that can be learned on ports 1, 2, 3, and 6 in a VLAN named accounting, to 128 addresses:

```
configure ports 1, 2, 3, 6 vlan accounting learning-limit 128
```

The following example locks ports 4 and 5 of VLAN accounting, converting any FDB entries to static entries, and prevents any additional address learning on these ports:

```
configure ports 4,5 vlan accounting lock-learning
```

The following example removes the learning limit from the specified ports:

```
configure ports 1, 2, vlan accounting unlimited-learning
```

The following example unlocks the FDB entries for the specified ports:

```
configure ports 4,5 vlan accounting unlock-learning
```

The following example illustrates use of the **tagged** keyword:

```
configure ports 1 tag 10 vlan accounting learning-limit 128
configure ports 1 vlan accounting learning-limit 128
configure ports 4 tag 10 vlan accounting lock-learning
configure ports 4 vlan accounting lock-learning
```

History

This command was first available in ExtremeXOS 11.1.

The *vlan_list* option was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure power monitor

```
configure power monitor poll-interval [off | seconds] change-action
   [none | [log | log-and-trap | trap] change-threshold watts]
```

Description

Configures the power visualization, which periodically polls for input power usage.

Syntax Description

seconds	Input power usage poll interval in seconds. If zero is configured, then the input power measurement is disabled.
change-action	The action to be taken whenever the power is increased or decreased by the configured threshold power value (none, log, log-and-trap, or trap).
watts	The power value in watts for the change threshold. The default value is 2 watts.

Default

The default poll interval is 60 seconds.

The default change action is none.

The default change threshold is 2 watts.

Usage Guidelines

Use this command to configure change actions to be taken when input power usage is increased or decreased by the configured threshold power value. The polling interval is also configurable, with a default value of 60 seconds.

Note

Input power usage values are only estimates.

Example

The following command configures a polling interval of 10 seconds, a change action of log-and-trap, and a change threshold of 3 watts:

```
configure power monitor poll-interval 10 change-action log-and-trap change-threshold 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure private-vlan add network

`configure private-vlan` *`name`* **`add network`** *`vlan_name`*

Description

Adds the specified *VLAN* as the network VLAN on the specified PVLAN.

Syntax Description

`name`	Specifies the name of the PVLAN to which the VLAN is added.
`vlan_name`	Specifies a VLAN to add to the PVLAN.

Default

N/A.

Usage Guidelines

The VLAN must be created and configured with a tag before it is added to the PVLAN.

Example

The following example adds VLAN "sharednet" as the network VLAN for the PVLAN named "companyx":

```
configure private-vlan companyx add network sharednet
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in the *Switch Engine 32.2 Feature License Requirements* document.

configure private-vlan add subscriber

```
configure private-vlan name add subscriber vlan_name {non-isolated}
   {loopback-port port}
```

Description

Adds the specified *VLAN* as a subscriber VLAN on the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN to which the VLAN is added.
vlan_name	Specifies a VLAN to add to the PVLAN.
non-isolated	Configures the subscriber VLAN as a non-isolated subscriber VLAN.
port	Specifies the port that serves as the loopback port.

Default

If the **non-isolated** option is omitted, this command adds the specified VLAN as an isolated subscriber VLAN.

Usage Guidelines

The VLAN must be created and configured with a tag before it is added to the PVLAN. If the non-isolated option is omitted, the VLAN is added as an isolated subscriber VLAN. If the non-isolated option is included, the VLAN is added as an non-isolated subscriber VLAN.

If two or more subscriber VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the subscriber VLANs with overlapping ports must have a dedicated loopback port.

Example

The following example adds VLAN "restricted" as a subscriber VLAN for the PVLAN named "companyx":

```
configure private-vlan companyx add subscriber restricted isolated
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure private-vlan delete

```
configure private-vlan name delete [network | subscriber] vlan_name
```

Description

Deletes the specified *VLAN* from the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN from which the VLAN is deleted.
network	Specifies that the VLAN to be deleted is a network VLAN.
subscriber	Specifies that the VLAN to be deleted is a subscriber VLAN.
vlan_name	Specifies the VLAN to delete from the PVLAN.

Default

N/A.

Usage Guidelines

This command deletes a VLAN from a PVLAN, but it does not delete the VLAN from the system—it just breaks the link between the VLAN and the PVLAN. You can use this command to delete both network and subscriber VLANs.

Example

The following example deletes network VLAN "sharednet "from the PVLAN named "companyx":

```
configure private-vlan companyx delete network sharednet
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. For features and the platforms that support them, see the *Switch Engine 32.2 Feature License Requirements* document.

configure protocol add

```
configure protocol {filter} filter_name add [etype | llc | snap] hex
   {[etype | llc | snap] hex}
```

Description

Configures a user-defined protocol filter.

Syntax Description

filter	Configures a protocol filter.
filter_name	Specifies a protocol filter name.
add	Specifies that you add a protocol.
delete	Specifies that you delete a protocol.
etype	Specifies an ethertype protocol.
llc	Specifies LLC protocol.
snap	Specifies SNAP protocol.
hex	Specifies a four-digit hexadecimal number between 0 and FFFF that represents: • The Ethernet protocol type taken from a list maintained by the IEEE. • The DSAP/SSAP combination created by concatenating a two-digit LLC Destination SAP (DSAP) and a two-digit LLC Source SAP (SSAP). • The SNAP-encoded Ethernet protocol type.

Default

N/A.

Usage Guidelines

Supported protocol types include:

- etype—IEEE Ethertype.
- llc—LLC Service Advertising Protocol.
- snap—Ethertype inside an IEEE SNAP packet encapsulation.

A maximum of 16 customized protocol filters can be active at a time.

The protocol filter must already exist before you can use this command. Use the `create protocol` command to create the protocol filter.

Note

Protocol-based *VLAN* for Etype from 0x0000 to 0x05ff are not classifying as per filter. When traffic arrive with these Etypes, it is classifed to native VLAN rather protocol-based VLAN.

Example

The following example adds *MPLS* to "my_filter":

```
configure protocol "my_filter" add etype 0x8847
configure protocol  filter "my_filter" add etype 0x8847
```

The following example deletes MPLS from "my_other_filter":

```
configure protocol "my_other_filter" delete etype 0x8847
configure protocol  filter "my_other_filter" delete etype 0x8847
```

History

This command was first available in ExtremeXOS 10.1.

The **`filter`** keyword and options were added in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure process group other cpu-limit

`configure process group` **`other cpu-limit`** *`cpu_limit`*

Description

This command changes the CPU limit for the "Other" (non-vital) process group.

Syntax Description

other	Designates "Other" (non-vital) process group.
cpu-limit	Designates changing the maximum amount of CPU that the "Other" process group can use during resource contention.
cpu-limit	Sets the value for the CPU limit value as a percentage. The valid range is 5% to 50%; default is 10%.

Default

By default, the CPU limit of "Other" group is 10%. With the default configuration, the "Vital" group CPU limit is 90%.

Usage Guidelines

This command allows you to configure CPU limits for the “Other” group. The configured CPU percentage is guaranteed for the "Other" group, unless a real-time kernel task needs CPU.

When this command is issued, the CPU limit for the "Vital" group is changed as well. For example, if you change the CPU limit value to 30, the new values are: 70% for "Vital", and 30% for "Other".

If you try to configure a limit that is greater than the current configured value, a warning message appears:

```
Warning: Increasing CPU limit of the “Other” group may degrade EXOS performance and lead
to network instability. The CPU limit for the “Other” group has been increased from 10% to
30%.
```

To see the status of the process groups, use the command show process group on page 3128.

Example

The following example changes the "Other" process group CPU limit to 30%. Additionally, the "Vital" group is changed to 70%:

```
# configure process group other cpu-limit 30
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure process group other memory-limit

`configure process group` **`other memory-limit`** *`memory_limit`*

Description

This command changes the memory limit for the "Other" (non-vital) process group.

Syntax Description

other	Designates "Other" (non-vital) process group.
memory-limit	Designates changing the memory limit for the "Other" process group.
memory-limit	Sets the value, as a percentage, for the "Other" process group memory limit. The valid range is 5% to 50%; default is 5% of total system memory.

Default

Default memory limit for the "Other" group is 5% of total system memory. With the default configuration, the memory limit of the "Vital" group is 95%.

Usage Guidelines

This command allows you to increase or decrease the memory limit assigned to the “Other” (non-vital) process group. The configured limit is used as the new upper bound for the "Other" group. When this command is issued, the memory limit for the "Vital" group is changed as well. For example, if the current value is 95% for "software application", and 5% for “Other”, if you change the memory limit value to 30, the new values are: 70% for "Vital", and 30% for “Other”.

When you issue this command, a warning message appears:

```
Warning: Increasing memory-limit of the “Other” group will reduce the available memory for
“EXOS”.
```

If you try to set a memory limit below the value that is already consumed by the "Other" group, an error message appears. For example, when you change the memory limit to 5% when it is already consuming 8.7%, the following error message appears.

```
Error: Desired memory-limit (5%) must be greater than or equal to the current memory
consumption (8.7%) of the group “Other”.
```

You also cannot increase the memory limit on a process group beyond the available memory for the process group. For example, if you try increasing the memory limit on the “Other” (non-vital) group to 40% when the group is already consuming 70%, the following error message appears:

```
Error: Desired memory-limit (40%) must be less than or equal to the available memory of
(30%) for the “Other” group. “EXOS” is currently consuming 70% of system memory.
```

To see the status of the process groups, use the command show process group on page 3128.

Example

The following example sets the "other" process group memory limit to 25%. This also sets the memory limit to 75% for the "Vital" group:

```
# configure process group other memory-limit 25
```

History

This command was first available in ExtremeXOS 22.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure protocol delete

```
configure protocol name delete [etype | llc | snap] hex {[etype | llc |
   snap] hex} ...
```

Description

Deletes the specified protocol type from a protocol filter.

Syntax Description

name	Specifies a protocol filter name.
hex	Specifies a four-digit hexadecimal number between 0 and FFFF that represents: • The Ethernet protocol type taken from a list maintained by the IEEE. • The DSAP/SSAP combination created by concatenating a two-digit LLC Destination SAP (DSAP) and a two-digit LLC Source SAP (SSAP). • The SNAP-encoded Ethernet protocol type.

Default

N/A.

Usage Guidelines

Supported protocol types include:

- etype—IEEE Ethertype.
- llc—LLC Service Advertising Protocol.
- snap—Ethertype inside an IEEE SNAP packet encapsulation.

Example

The following example deletes protocol type LLC SAP with a value of FEFF from protocol "fred":

```
configure protocol fred delete llc feff
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure protocol filter

```
configure protocol filter filter_name [add | delete] dest-mac
   mac_address {[etype | llc | snap] hex} {field offset offset value
   value {mask mask}} {tagged}
```

Description

Configures the destination address as well as an arbitrary field of the protocol.

Syntax Description

filter_name	Specifies a protocol filter name.
add	Specifies that you add a protocol.
delete	Specifies that you delete a protocol.
dest-mac	Specifies the destination MAC address used by PDUs of the protocol.
mac_address	Specifies the MAC address.
etype	Specifies the EtherType used by PDUs of the protocol.
llc	Specifies the LLC DSAP and SSAP used by PDUs of the protocol.
snap	Specifies the SNAP protocol identifier used by PDUs of the protocol.
hex	Specifies a four-digit hexadecimal number between 0 and FFFF that represents: • The Ethernet protocol type taken from a list maintained by the IEEE. • The DSAP/SSAP combination created by concatenating a two-digit LLC Destination SAP (DSAP) and a two-digit LLC Source SAP (SSAP). • The SNAP-encoded Ethernet protocol type.
field	Specifies a field used by PDUs of the protocol.
offset	Specifies the offset of the field from the start of the PDU.
value *value*	Specifies the value of the field in hexadecimal (for example, A1:B2:0C. Maximum 16 bytes).
mask *mask*	Specifies the mask for the field in hexadecimal (for example, FF:FF:0F. Maximum 16 bytes).
tagged	Specifies if the protocol is a tagged protocol. Default is not tagged.

Default

N/A.

Usage Guidelines

Supported protocol types include:

- etype—IEEE Ethertype.
- llc—LLC Service Advertising Protocol.
- snap—Ethertype inside an IEEE SNAP packet encapsulation.

A maximum of 15 protocol filters, each containing a maximum of six protocols, can be defined.

The protocol filter must already exist before you can use this command. Use the `create protocol` command to create the protocol filter.

No more than seven protocols can be active and configured for use.

Note

Protocol-based *VLAN* for Etype from 0x0000 to 0x05ff are not classifying as per filter. When traffic arrive with these Etypes, it is classifed to native VLAN rather than protocol-based VLAN.

Example

The following example LACP to the protocol list "mylist":

```
configure protocol “mylist” add dest-mac 01:80:C2:00:00:02 etype 0x8809 field offset 14
value
01 mask FF
```

The following example removes EFM OAM from the protocol list "mylist":

```
configure protocol filter “mylist” delete dest-mac 01:80:C2:00:00:02 etype 0x8809 field
offset
14 value 03 mask FF
```

The following example configures a mismatched mask and value:

```
configure protocol “mylist” delete dest-mac 01:80:C2:00:00:02 etype 0x8809 field offset
14 value 03 mask FF:FF
Error: The length of the field value is not the same as the field mask.
```

History

This command was first available in ExtremeXOS 15.5.

The **tagged** keyword was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure qosprofile

```
configure qosprofile egress qosprofile [{minbw minbw_number} {maxbw
   maxbw_number} | {peak_rate peak_bps [K | M]}] [ports [port_list |
   port_group |all]]

configure qosprofile qosprofile [{minbw minbw_number} {maxbw
   maxbw_number} | {{committed_rate committed_bps [K | M]} {peak_rate
   peak_bps [K | M]} | [ports [port_list | all]]

configure {qosprofile} qosprofile [{maxbuffer buffer_percentage} {weight
   weight_value | use-strict-priority} {ports [port_list | port_group |
   all]}]
```

Description

Modifies the default egress *QoS* profile parameters.

Syntax Description

minbw	The minimum bandwidth (minbw) option specifies the committed information rate as a percentage of the maximum port speed. The range is 0 to 100%, and the default value is 0. When autonegotiation is off, the CIR is the specified percentage of the configured port speed. When autonegotiation is on, the CIR is the specified percentage of the maximum port speed.
maxbw	The maximum bandwidth (maxbw) option specifies the peak rate as a percentage of the maximum port speed. The range is 0 to 100%, and the default value is 100. When autonegotiation is off, the peak rate is the specified percentage of the configured port speed. When autonegotiation is on, the peak rate is the specified percentage of the maximum port speed (the switch does not detect the negotiated port speed).
peak_rate	Specifies a peak rate in Kbps (k) bits or Mbps (m).
committed_rate	Specifies a committed information rate in Kbps (k) bits or Mbps (m).
port_list	Specifies a list of slots and ports to which the parameters apply. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
buffer_percentage	When used without a port-list, specifies the percentage of the total buffer you are reserving for this QoS profile on all ports for which an override has not been configured. The range is 1 to 100; the default setting is 100. When used with a port-list, specifies a percentage override of the maxbuffer setting for the QoS profile specified. The range is 1-10000; the default is 100 (i.e., no override). Setting 100% is equivalent to unconfiguring the maxbuffer override.
qosprofile	Specifies a QoS profile name.
use-strict-priority	When the global qosscheduler configuration (configure qosscheduler command) is set to weighted-round-robin, this option overrides the global configuration for the specified QoS profile, so that it operates in strict-priority-mode. This enables hybrid strict-priority and weighted-round-robin scheduling operation.

weight-value	Specifies the weight value used for queue service weighting in the weighted-round-robin scheduler for this QoS profile. Range is 1-15 or 1-127 depending on hardware type. 0=strict-priority. Default is 1. This command enables the user to input a weight for queues in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler. The weight of both WRR and WDRR algorithms have been extended to 1-127.
ports	Port list for maxbuffer and per-port weight override.
port_list	Port list.
port_group	Port group name.
all	Specifies this applies to all ports on the device.

Default

- QoS profiles—QP1 and QP8 on SummitStack and ExtremeXOS series switches
- Minimum bandwidth—0%
- Maximum bandwidth—100%
- Maximum buffer—100%
- Maxbuffer override—100% (no override)
- Weight—1
- Priority—By default, each qosprofile is assigned a different priority level:
  - QP1 - 1, Low (the lowest priority)
  - QP2 - 2, LowHi
  - QP3 - 3, Normal
  - QP4 - 4, NormalHi
  - QP5 - 5, Medium
  - QP6 - 6, MediumHi
  - QP7 - 7, High
  - QP8 - 8, HighHi (highest priority)

Usage Guidelines

Note

You can view the effect of setting the buffer-percentage using the `show ports` *`port-list`* `buffer` command.

Note

You can view the configured buffer-percentage value using the `show qosprofile` or `show qosprofile ports` *`port-list`* commands, respectively.

The maximum bandwidth value can be configured as either:

- An absolute percentage of the total maximum link speed, regardless of the currently configured or negotiated speed, OR
- An absolute peak rate in Mbps or Kbps.

QoS profiles QP1 and QP8 are preconfigured. If you want to use a QoS profile in the range of QP2 through QP7, you must first create the QoS profile. QoS profile QP7 is reserved on SummitStack for stack management and cannot be created or modified.

When specified without a port-list, the maxbuffer parameter can configure a reduction in the maximum amount of packet buffer space allotted to the specified QoS profile. If you reduce the allotment below the default value of 100%, the reduction releases packet buffer space to the shared packet buffer. Regardless of the setting for this parameter, the system does not drop any packets as long as reserved packet buffer memory for the port and QOS profile or shared packet memory for the port remains available.

Note

The configuration defined by the maxbuffer attribute in this command can be overridden on a per-port basis if the port is specified along with the maxbuffer parameter.

When specified with a port-list, the maxbuffer setting overrides the system-wide reduction of packet buffer reservation set with the configure qosprofile maxbuffer command for the specified QoS profile. If the packet buffer reservation is reduced to 75 percent for the entire QoS profile, the specified ports are allotted 75% of the allotment for the specified QoS profile. If for specified ports the maxbuffer is set to 200 percent, the packet buffer reservation will be set to 200 percent of the normal packet buffer reservation for those ports, thus overriding the maxbuffer percentage set for the QoS profile.

Note

The packet buffer configuration feature is provided for expert users who fully understand the impact of buffer configuration changes. Improper buffer configuration can stop traffic flow through QoS profiles and ports for which no direct configuration change was made.

A range of ports has its own packet buffer pool. The maxbuffer override capability allows you to overcommit the packet buffer pool for the port range. When a packet buffer pool is overcommitted by more than 20%, the following message appears in the system log:

```
Warning: Packet memory is overcommitted by <percentage> for ports in range <port-range>
```

It is also possible to configure maxbuffer overrides such that the size of the shared portion of the buffer pool is reduced to zero. If some port and QoS profile in the port range for that buffer pool does not have sufficient reserved packet memory to accommodate larger packets, it will be impossible for that port and QoS profile to transmit any packets of the larger size. In this case, the following message appears in the system log:

```
Warning: At least one port and QoS profile in port range <port-range> cannot transmit
packets larger than <packet-size> because of packet memory configuration.
```

The weight-value parameter does not apply when the switch is configured for strict priority scheduling, which is the default configuration. To configure the type of scheduling you want to use for the entire switch, use the `configure qosscheduler` command.

The weight-value parameter configures the relative weighting for each QoS profile. Because each QoS profile has a default weight of 1, all QoS profiles have equal weighting. If you configure a QoS profile with a weight of 4, that specified QoS profile is serviced 4 times as frequently as the remaining QoS profiles, which still have a weight of 1. If you configure all QoS profiles with a weight of 16, each QoS profile is serviced equally but for a longer period.

When the switch is configured for weighted-round-robin mode, the use-strict-priority option overrides the switch configuration for the specified QoS profile on all ports. Among QoS profiles configured with the use-strict-priority-option, QoS profile QP8 has the highest priority and QP1 has the lowest priority. All strict-priority QoS profiles are serviced first according to their priority level, and then all other QoS profiles are serviced based on their configured weight.

Note

If you specify use-strict-priority, lower-priority queues and weighted-round-robin queues are not serviced at all as long as higher-priority queues have any remaining packets.

Example

The following example overrides the maximum buffer setting configured on QoS profile qp1 for port1:1:

```
# configure qosprofile qp1 maxbuffer 75 port 1:1
```

History

This command was first available in ExtremeXOS 10.1.

Committed and peak rates were added in ExtremeXOS 11.0. Also in ExtremeXOS 11.0, ports were made mandatory.

Support for all platforms was added in the respective platform introduction releases.

The use-strict-priority option was added in ExtremeXOS 12.3.

The ability to configure a maxbuffer override was added in ExtremeXOS 12.5.

The *port_group* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on all platforms with specific parameter exceptions as noted in the Syntax Description above.

configure qosprofile weight

```
configure qosprofile qp8 weight weight_value
```

Description

This command enables the user to input a weight value for queue service weighting in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler for this *QoS* profile. The weight value of both WRR and WDRR algorithms have been extended to 1-127 on this supported hardware (refer to the *Switch Engine 32.2 User Guide* for supported hardware).

Syntax Description

weight_value	Range is 1-15 or 1-127 depending on hardware type.

Default

Strict priority.

Usage Guidelines

Use this command to input a weight value for queue service weighting in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler for this QoS profile. The weight value of both WRR and WDRR algorithms have been extended to 1-127 on this supported hardware (refer to the *ExtremeXOS 22.6 User Guide* for supported hardware).

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure qosprofile wred

```
configure {qosprofile} {egress} qosprofile [wred [{color [tcp [green
   | red] | non-tcp [any|red]] [{min-threshold min_thresh} {max-
   threshold } {max-drop-rate max_drop_rate}]} | avg-weight avg_weight]]
   ports [port_list |all]
```

Description

Configures WRED on the specified *QoS* profile for the specified port.

Syntax Description

egress	This optional parameter specifies an egress QoS profile.
qosprofile	Specifies a QoS profile name. Valid names are QP1 to QP8.
color	Specifies the WRED color to be configured.
green	Specifies that the WRED configuration applies to TCP traffic that is marked green.
non-tcp any	Specifies that the WRED configuration applies to any non-TCP traffic.
red	Specifies that the WRED configuration applies to TCP traffic that is marked red.
min_thresh	Specifies the minimum threshold for the specified WRED color. The range is 1 to 100 percent.

max_threshold	Specifies the maximum threshold for the specified WRED color. The range is 1 to 100 percent.
max_drop_rate	Specifies the maximum drop rate for the specified WRED color. The range is 1 to 100 percent.
port_list	Specifies a list of slots and ports to which the parameters apply. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
non-tcp red	Specifies that the WRED configuration applies to non-TCP traffic that is marked red.
avg_weight	Specifies the weight constant for calculating the average queue size for the specified QoS profile. The range is 1 to 15.
all	Specifies that this command applies to all ports on the device.

Default

- Minimum threshold—100%
- Maximum threshold—100%
- Maximum drop rate—100%
- Average weight—4

Usage Guidelines

The *max_drop_rate*, *min_threshold*, and *max_threshold* parameters apply to the specified color. The **avg_weight** parameter applies to all colors on the specified QoS profile. Increasing the avg_weight value reduces the probability that traffic is dropped. Conversely, decreasing the avg_weight value increases the probability that traffic is dropped.

Example

The following example configures WRED settings for port 2:1, QoS profile qp3, color green:

```
configure qosprofile qp3 wred color tcp green min-threshold 80 max-threshold 95 max-drop-rate 75 ports 2:1
```

The following example configures the average weight for port 2:1, QoS profile qp2:

```
configure qosprofile qp2 wred avg-weight 4 ports 2:1
```

The following example configures WRED settings for non-TCP traffic on port 4, QoS profile qp3:

```
configure qosprofile qp3 wred color non-tcp any min-threshold 10 ports 4
```

The following example configures WRED settings using "wredGroup" as the *port_group* variable:

```
configure qosprofile qp8 wred color tcp red min-threshold 25 max-streshold 75 max-drop-rate 30 ports wredGroup
```

History

This command was first available in ExtremeXOS 12.7.

The *port_group* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

configure qosprofile egress wred ecn

```
configure qosprofile egress qp_num wred ecn [on | off] ports [port_list
   | all]
```

Description

This command turns Explicit Congestion Notification (ECN) on or off for the corresponding QoS profile for the given port(s).

Syntax Description

qp_num	QoS profile (qp1, qp2, qp3, qp3, qp4, qp5, qp6, qp7, qp8)
wred	Designates weighted random early detection (WRED).
ecn	Designates ECN.
on	Enables ECN.
off	Disables ECN.
ports	Selects ports.
port_list	Selects specific ports to apply the ECN setting for the designated QoS profile.
all	Selects all ports to apply the ECN setting for the designated QoS profile.

Default

N/A.

Usage Guidelines

Weighted Random Early Detection (WRED) drops the packets, based on the average length exceeding a specific threshold value to indicate congestion. Explicit Congestion Notification (ECN) is an extension to WRED that marks the drop-eligible packets, instead of dropping, using the same criteria of minimum threshold, maximum threshold, and drop probability

Example

The following example enables ECN for QoS profile 5 on port 2:

```
# configure qosprofile egress qp5 wred ecn on ports 2
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on the ExtremeSwitching 5520 platform.

configure qosscheduler weighted-deficit-round-robin

```
configure qosscheduler [strict-priority | weighted-round-robin |
   weighted-deficit-round-robin ] {ports [port_list | port_group |
   all ]}
```

Description

This command specifies the scheduling algorithm that the switch uses to service *QoS* profiles.

Syntax Description

strict-priority	Specifies the switch services the higher-priority QoS profiles first.
weighted-round-robin	Specifies the switch services all QoS profiles based on the configured weighting for each QoS profile.
weighted-deficit-round-robin	Allows you to use a credit-based algorithm in order to sample the size of the packet while scheduling various queues.
ports	Ports to display.
port_list	Port list.
port_group	Port group name
all	Al portsl.

Default

Strict-priority.

Usage Guidelines

When issued without a port_list or port_group, this command configures the global scheduling algorithm that will be applied to all ports that have not been configured with per-port scheduling. When issued with a port_list or port_group, this command configures the scheduling algorithm for specific ports.

The scheduling algorithm for a qosprofile can be overridden either globally or on a per-port basis with the command:

`configure qosprofile` *qosprofile* **use-strict-priority**

In strict-priority mode, QoS profile QP8 has the highest priority and QP1 has the lowest priority.

Note
Queues are serviced using the configured scheduling algorithm until all of the minBws are satisfied, then all queues are serviced using the configured scheduling algorithm until all of the maxBws are satisfied.

Example

The following example configures the switch for weighted-round-robin servicing:

```
configure qosscheduler weighted-round-robin
```

The following example configures the switch for weighted-deficit-round-robin servicing:

```
configure qosscheduler weighted-deficit-round-robin
```

This command specifies the scheduling algorithm the switch uses to service QoS profiles. Weighted-deficit-round-robin mode of scheduling allows you to use a credit based algorithm in order to sample in the size of the packet while scheduling various queues.

History

This command was first available in ExtremeXOS 15.1.

The **ports** and **all** keywords, and *port_list* and *port_group* variables were added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius algorithm

```
configure radius algorithm [standard | round-robin]
```

Description

This command is used to configure the algorithm used to determine the rotation of *RADIUS* servers.

Syntax Description

standard	Standard Extreme retransmission algorithm.
round-robin	Simple Round Robin retransmission algorithm.

Default

Standard.

Usage Guidelines

Use this command to configure the algorithm to determine rotation of RADIUS servers.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius retries

```
configure radius {mgmt-access [primary | secondary] | netlogin [primary
    | secondary] | index} retries retries
```

Description

This command is used to set the number of retries the switch will attempt. This value may be global or on a per server basis.

Syntax Description

mgmt-access	*RADIUS* authentication for management access.
netlogin	RADIUS authentication for netlogin access.
primary	Primary server.
secondary	Secondary server.
index	RADIUS server index.
retries	RADIUS server retries.
retries	RADIUS sever retries. Range 1-20.

Default

The default value is 3, with a range of 0-10.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius server client-ip

```
configure radius {mgmt-access | netlogin} [primary | secondary | index]
   server [host_ipaddr | host_ipV6addr | hostname] {udp_port | tls
   {tls_port}} client-ip [client_ipaddr | client_ipV6addr] {vr vr_name}
   {shared-secret {encrypted} secret}
```

Description

This command configures up to eight *RADIUS* authentication servers.

Note

It is recommended to enable loopback mode on the *VLAN* associated with radius if the radius connectivity is established via a front panel port on a SummitStack.

Syntax Description

mgmt-access	Specifies the RADIUS authentication server for switch management.
netlogin	Specifies the RADIUS authentication server for network login.
primary	Configures the primary RADIUS authentication server.
secondary	Configures the secondary RADIUS authentication server.
index	RADIUS server index. Range: 1 - 2147483641.
ipaddress	The IP address of the server being configured.
host_ipV6addr	Server IPv6 address.
hostname	The host name of the server being configured.
udp_port	The UDP port to use to contact the RADIUS authentication server.
tls	Specifies using Transfer Layer Security (TLS).
tls_port	The TLS port to use to contact the RADIUS authentication server.
ipaddress	The IP address used by the switch to identify itself when communicating with the RADIUS authentication server.
client_ipV6addr	Client IPv6 address.
vr_name	Specifies the virtual router on which the client IP is located. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
shared-secret	Shared secret

secret	Secret string. Important: Use quotes to enclose the string. Failure to do so causes the CLI to treat the string as a comment, since the string starts with a"#" symbol.
encrypted	Password is encrypted.

Default

The following lists the default behavior of this command:

- The UDP port setting is 1812.
- The TLS port setting is 2083.
- The virtual router used is *VR-Mgmt*, the management virtual router.
- Switch management and network login use the same primary and secondary RADIUS servers for authentication (only if the realm is not specified in the command).,

Usage Guidelines

Use this command to specify RADIUS server information.

Use of the *hostname* parameter requires that DNS be enabled.

The RADIUS server defined by this command is used for user name authentication and CLI command authentication.

Beginning with ExtremeXOS 11.2, you can specify one pair of RADIUS authentication servers for switch management and another pair for network login. To specify RADIUS authentication servers for switch management (Telnet, SSH, and console sessions), use the **mgmt-access** keyword. To specify RADIUS authentication servers for network login, use the **netlogin** keyword. If you do not specify a keyword, switch management and network login use the same pair of RADIUS authentication servers.

If you are running ExtremeXOS 11.1 or earlier and upgrade to ExtremeXOS 11.2, you do not lose your existing RADIUS server configuration. Both switch management and network login use the RADIUS authentication server specified in the older configuration.

Specifying **mgmt-access** or **netlogin** before the index will create a RADIUS entry with only that realm specified, if neither are specified both realms will be enabled.

Note
You cannot use a stacking alternate IP address as the RADIUS client in primary RADIUS server configuration.

Example

The following example configures the primary RADIUS server on host radius1 using the default UDP port (1812) for use by the RADIUS client on switch 10.10.20.30 using a virtual router interface of *VR-Default*:

```
configure radius primary server radius1 client-ip 10.10.20.30 vr vr-Default
```

The following example configures the primary RADIUS server for network login authentication on host netlog1 using the default UDP port for use by the RADIUS client on switch 10.10.20.31 using, by default, the management virtual router interface:

```
configure radius netlogin primary server netlog1 client-ip 10.10.20.31
```

History

This command was first available in ExtremeXOS 10.1.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

The *index*, *host_ipV6addr*, *client_ipV6addr*, **shared-secret**, and **encrypted** keywords were added in ExtremeXOS 16.1.

The **tls** keyword with *tls_port* variable was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius shared-secret

```
configure radius [primary | secondary index] shared-secret
   {encryptedencrypted_secret | secret}
```

Description

Configures the authentication string used to communicate with the *RADIUS* authentication server.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
primary	Configures the authentication string for the primary RADIUS server.
secondary	Configures the authentication string for the secondary RADIUS server.
index	RADIUS server index.
encrypted	Indicates that the string is already encrypted.
secret	The string to be used for authentication.

Default

Unconfigured.

Usage Guidelines

The secret must be the same between the client switch and the RADIUS server.

The RADIUS server must first be configured for use with the switch as a RADIUS client.

The **mgmt-access** keyword specifies the RADIUS server used for switch management authentication.

The **netlogin** keyword specifies the RADIUS server used for network login authentication.

If you do not specify the **mgmt-access** or **netlogin** keywords, the secret applies to both the primary or secondary switch management and netlogin RADIUS servers.

The **encrypted** keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following example configures the shared secret as "purplegreen" on the primary RADIUS server for both switch management and network login:

```
configure radius primary shared-secret purplegreen
```

The following example configures the shared secret as "redblue" on the primary switch management RADIUS server:

```
configure radius mgmt-access primary shared-secret redblue
```

History

This command was first available in ExtremeXOS 10.1.

The **encrypted** keyword was added in ExtremeXOS 11.0.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

The *index* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius timeout

```
configure radius {mgmt-access {primary | secondary} | netlogin {primary
    | secondary} | index } timeout sec
```

Description

Configures the timeout interval for *RADIUS* authentication requests.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
primary	Primary server.
secondary	Secondary server.
index	RADIUS server index.
seconds	Specifies the number of seconds for authentication requests. Range is 1 to 240 seconds.

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for RADIUS authentication requests. When the timeout has expired, another authentication attempt will be made. After three failed attempts to authenticate, the alternate server will be used. This only refers to the default configuration. After six failed attempts, local user authentication will be used.

The mgmt-access keyword specifies the RADIUS server used for switch management authentication.

The netlogin keyword specifies the RADIUS server used for network login authentication.

If you do not specify the mgmt-access or netlogin keywords, the timeout interval applies to both switch management and netlogin RADIUS servers.

Example

The following example configures the timeout interval for RADIUS authentication to 10 seconds. After 30 seconds (three attempts), the alternate RADIUS server will be used. After 60 seconds (six attempts) local user authentication is used.

Note
This example assumes the default number of retries.

```
configure radius timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius-accounting retries

```
configure radius-accounting {mgmt-access [primary | secondary] |
   netlogin [primary | secondary] | index} retries retries
```

Description

This command is used to set the number of retries the switch will attempt. This value may be global or on a per server basis.

Syntax Description

mgmt-access	*RADIUS* authentication for management access
netlogin	RADIUS authentication for netlogin access.
primary	Primary server.
secondary	Secondary server.
index	RADIUS server index.
retries	RADIUS server retries.
retries	RADIUS sever retries. Range 1-20.

Default

The default value is 3, with a range of 0-10.

Usage Guidelines

None.

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius-accounting server client-ip

```
configure radius-accounting { mgmt-access | netlogin } [ primary
   | secondary | index ] server [ host_ipaddr | host_ipV6addr |
   hostname] {udp_port | tls {tls_port}} client-ip [ client_ipaddr |
   client_ipV6addr] {vr vr_name} {shared-secret {encrypted} secret}
```

Description

Configures the *RADIUS* accounting server.

Syntax Description

mgmt-access	Specifies the RADIUS authentication server for switch management.
netlogin	Specifies the RADIUS authentication server for network login.
primary	Configures the primary RADIUS authentication server.
secondary	Configures the secondary RADIUS authentication server.
index	RADIUS server index. Range: 1 - 2147483641.
ipaddress	The IP address of the server being configured.
host_ipV6addr	Server IPv6 address.
hostname	The host name of the server being configured.
udp_port	The UDP port to use to contact the RADIUS authentication server.
tls	Specifies using Transfer Layer Security (TLS).
tls_port	The TLS port to use to contact the RADIUS accounting server.
ipaddress	The IP address used by the switch to identify itself when communicating with the RADIUS authentication server.
client_ipV6addr	Client IPv6 address.
vr_name	Specifies the virtual router on which the client IP is located. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
shared-secret	Shared secret
secret	Secret string.
encrypted	Password is encrypted.

Default

The following lists the default behavior of this command:

- The UDP port setting is 1813.
- The TLS port setting is 2083.
- The virtual router used is *VR-Mgmt*, the management virtual router.
- Switch management and network login use the same RADIUS accounting server.

Usage Guidelines

Use this command to specify the radius accounting server.

The accounting server and the RADIUS authentication server can be the same.

Use of the *hostname* parameter requires that DNS be enabled.

Beginning with ExtremeXOS 11.2, you can specify one pair of RADIUS accounting servers for switch management and another pair for network login. To specify RADIUS accounting servers for switch management (Telnet, SSH, and console sessions), use the **mgmt-access** keyword. To specify RADIUS accounting servers for network login, use the **netlogin** keyword. If you do not specify a keyword, switch management and network login use the same pair of RADIUS accounting servers.

If you are running ExtremeXOS 11.1 or earlier and upgrade to ExtremeXOS 11.2, you do not lose your existing RADIUS accounting server configuration. Both switch management and network login use the RADIUS accounting server specified in the older configuration.

Example

The following example configures RADIUS accounting on host radius1 using the default UDP port (1813) for use by the RADIUS client on switch 10.10.20.30 using a virtual router interface of *VR-Default* for both management and network login:

```
configure radius-accounting primary server radius1 client-ip 10.10.20.30 vr vr-Default
```

The following example configures RADIUS accounting for network login on host netlog1 using the default UDP port for use by the RADIUS client on switch 10.10.20.31 using the default virtual router interface:

```
configure radius-accounting netlogin primary server netlog1 client-ip 10.10.20.31
```

History

This command was first available in ExtremeXOS 10.1.

The **mgmt-access** and **netlogin** keywords were added in ExtremeXOS 11.2.

The *index*, *host_ipV6addr*, *client_ipV6addr*, **shared-secret**, and **encrypted** keywords were added in ExtremeXOS 16.1.

The **tls** keyword with *tls_port* variable was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius-accounting shared-secret

```
configure radius-accounting [primary | secondary index] shared-secret
   {encrypted encrypted_secret | secret }
```

Description

Configures the authentication string used to communicate with the *RADIUS* accounting server.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.
primary	Configures the authentication string for the primary RADIUS accounting server.
secondary	Configures the authentication string for the secondary RADIUS accounting server.
encrypted	Indicates that the string is already encrypted.
secret	The string to be used for authentication. Maximum length of 32 characters.

Default

Unconfigured.

Usage Guidelines

The secret must be the same between the client switch and the RADIUS accounting server.

The mgmt-access keyword specifies the RADIUS accounting server used for switch management.

The netlogin keyword specifies the RADIUS accounting server used for network login.

If you do not specify the mgmt-access or netlogin keywords, the secret applies to both the primary or secondary switch management and netlogin RADIUS accounting servers.

The encrypted keyword is primarily for the output of the `show configuration` command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “purpleaccount” on the primary RADIUS accounting server for both management and network login:

```
configure radius primary shared-secret purpleaccount
```

The following command configures the shared secret as “greenaccount” on the primary management RADIUS accounting server:

```
configure radius mgmt-access primary shared-secret greenaccount
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius-accounting timeout

```
configure radius-accounting {mgmt-access {primary | secondary} |
   netlogin {primary | secondary} | index } timeout sec
```

Description

Configures the timeout interval for *RADIUS*-Accounting authentication requests.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
primary	Primary server.
secondary	Secondary server.
index	RADIUS server index.
seconds	Specifies the number of seconds for authentication requests. Range is 1 to 240 seconds.

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for RADIUS-Accounting authentication requests. When the timeout has expired, another authentication attempt will be made. After three failed attempts to authenticate, the alternate server will be used.

The mgmt-access keyword specifies the RADIUS accounting server used for switch management.

The netlogin keyword specifies the RADIUS accounting server used for network login.

If you do not specify the mgmt-access or netlogin keywords, the timeout interval applies to both switch management and netlogin RADIUS accounting servers.

Example

This example configures the timeout interval for RADIUS-Accounting authentication to 10 seconds. After 30 seconds (three attempts), the alternate RADIUS server will be used:

Note
This example assumes the default number of retries of 3.

```
configure radius-accounting timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius dynamic-authorization server client-ip

```
configure radius dynamic-authorization index [nas-ip [ignore | require]
   | server [host_ipaddr | host_ipV6addr | hostname] {tls {tls_port}}
   client-ip [client_ipaddr | client_ipV6addr] {vr vr_name} {shared-
   secret {encrypted} secret}
```

Description

This command configures up to eight *RADIUS* servers with dynamic authorization.

Note
It is recommended to enable loopback mode on the *VLAN* associated with RADIUS if the RADIUS connectivity is established using a front panel port on a SummitStack.

Syntax Description

dynamic-authorization	Specifies RADIUS dynamic authorization.
index	RADIUS server index. Range: 1–2147483641.
nas-ip	Specifies configuring the Network Access Server (NAS) IP Address requirement.
ignore	Specifies to ignore the NAS-IP Address requirement.
require	Specifies to require the NAS-IP Address (default).
server *host_ipaddr* *host_ipV6addr*	Server IPv4 address in either IPv4 (*host_ipaddr*) or IPv6 (*host_ipV6addr*) format.
hostname	The host name of the server being configured.

tls	Specifies using Transmission Control Protocol (TCP).
tls_port	The TLS port to use to contact the RADIUS authentication server.
client-ip *client_ipaddr* *client_ipV6addr*	Client address in either IPv4 (*client_ipaddr*) or IPv6 format (*client_ipV6addr*).
vr *vr_name*	Specifies the virtual router on which the client IP is located. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
shared-secret	Shared secret.
secret	Secret string.
encrypted	Password is encrypted.

Default

The virtual router used is *VR-Mgmt*, the management virtual router.

Usage Guidelines

Use this command to specify RADIUS server information.

Use of the *hostname* parameter requires that DNS be enabled.

The RADIUS server defined by this command is used for user name authentication and CLI command authentication.

Example

The following example configures a RADIUS dynamic authorization server with server index 100 on host "radius1" using the default UDP port (1812) for use by the RADIUS client on switch 10.10.20.30 using a virtual router interface of *VR-Default*:

```
configure radius dynamic-authorization 100 server radius1 client-ip 10.10.20.30 vr vr-
Default
```

History

This command was first available in ExtremeXOS 22.1.

The **nas-ip** option with *ignore* and *require* variables were introducted in ExtremeXOS 31.3.

The **tls** keyword with *tls_port* variable was added in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius tls ocsp

```
configure radius tls ocsp [ on | off]
```

Description

This command configures Online Certificate Status Protocol (OCSP) globally for all RADIUS TLS servers.

Syntax Description

tls	Specifies Transport Layer Security (TLS).
ocsp	Specifies the OCSP attribute.
on	Specifies turning ON OCSP for all RADIUS TLS servers.
off	Specifies turning OFF OCSP for all RADIUS TLS servers.

Default

ON.

Usage Guidelines

This is not configurable per server.

Example

The following example turns off OCSP for all RADIUS TLS servers:

```
# configure radius tls ocsp off
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure radius tls ocsp nonce

```
configure radius tls ocsp nonce [on | off]
```

Description

Enables or disables Online Certificate Status Protocol (OCSP) nonce for RADIUS TLS servers.

Syntax Description

tls	Specifies Transport Layer Security (TLS).
ocsp	Specifies the OCSP attribute.
nonce	Specifies to cryptographically bind an OCSP request and an OCSP response with the extension `id-pkix-ocsp-nonce` to prevent replay attacks.
on	Specifies to include the `id-pkix-ocsp-nonce` extension in the OCSP request and response.
off	Specifies to exclude the extension (default).

Default

Off.

Usage Guidelines

Example

The following example configures nonce:

```
# configure radius tls ocsp nonce on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure radius tls ocsp override

`configure radius` **`tls ocsp override`** [*url* | **none**]

Description

This command configures one HTTP Online Certificate Status Protocol (OCSP) override URL for RADIUS TLS servers.

Syntax Description

tls	Specifies Transport Layer Security (TLS).
ocsp	Specifies the OCSP attribute.

override	Specifies to override the OCSP server in the AuthorityInformationAccess section of a RADIUS TLS server's certificate.
url	Specifies the URL of the OCSP override server. Default port is 80.
none	Specifies to remove the OCSP override URL configuration (default).

Default

None.

Usage Guidelines

Only HTTP is supported with either FQDN or IP.

Example

The following example configures an override URL of `http://radiusocsp:2021`:

```
# configure radius tls ocsp override http://radiusocsp:2021
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure radius tls ocsp signer

`configure radius` **`tls ocsp signer ocsp-nocheck`** `[`**`on`** | **`off`**`]`

Description

Enables or disables Online Certificate Status Protocol (OCSP) signer's ocsp-nocheck for RADIUS TLS servers.

Syntax Description

tls	Specifies Transport Layer Security (TLS).
ocsp	Specifies the OCSP attribute.
ocsp-nocheck	Specifies the extension `id-pkix-ocsp-nocheck`. If present in the OCSP signer's certificate, then it is trusted for its lifetime.
on	Specifies to override the `id-pkix-ocsp-nocheck` extension in the OCSP signer's certificate and forces the extension as if it is present.

off	Specifies to behave per the extension's presence in the OCSP signer's certificate. If not present and the OCSP signer is not root CA, then the whole OCSP will fail (default).
signer	Specifies the OCSP signer that signs the OCSP response.

Default

Off.

Usage Guidelines

Example

The following example enables OCSP signer's nocheck for a RADIUS TLS server.

```
# configure radius tls ocsp signer ocsp-nocheck on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure radius tls tcp-user-timeout

`configure radius` **`tls tcp-user-timeout`** [*seconds* | **`default`**]

Description

This command configures TCP connection timeout globally for all TLS servers.

Syntax Description

tls	Specifies Transport Layer Security (TLS).
tcp-user-timeout	Specifies the TCP user timeout attribute.
seconds	Specifies the timeout in seconds.
default	Specifies to use the system default timeout.

Default

Use the system's TCP user timeout setting.

Usage Guidelines

This is not configurable per server.

Example

The following example sets the TCP user timout to 60 seconds.

```
configure radius tls tcp-user-timeout 60
```

History

This command was first available in ExtremeXOS 31.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure rip add vlan

```
configure rip add vlan [vlan_name | all]
```

Description

Configures *RIP* on an IP interface.

Syntax Description

vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

When an IP interface is created, RIP configuration is disabled on the interface by default. When the RIP interface is disabled, the parameters are not reset to default automatically.

Example

The following command configures RIP on the VLAN finance:

```
# configure rip add finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip delete vlan

```
configure rip delete vlan [vlan_name | all]
```

Description

Disables *RIP* on an IP interface.

Syntax Description

vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

When an IP interface is created, RIP configuration is disabled on the interface by default. When the RIP interface is disabled by this command, the parameters are not reset to default automatically.

Example

The following command deletes RIP on a VLAN named finance:

```
# configure rip delete finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip garbagetime

```
configure rip garbagetime {seconds}
```

Description

Configures the *RIP* garbage time.

Syntax Description

seconds	Specifies a time in seconds.

Default

120 seconds.

Usage Guidelines

None.

Example

The following command configures the RIP garbage time to have a 60-second delay:

```
# configure rip garbagetime 60
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip import-policy

```
configure rip import-policy [policy-name | none]
```

Description

Configures the import policy for *RIP*.

Syntax Description

policy-name	Specifies the policy.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding RIP routes to the IP route table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove an import policy.

Example

The following example applies the policy campuseast to RIP routes:

```
# configure rip import-policy campuseast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip routetimeout

`configure rip routetimeout` *`seconds`*

Description

Configures the route timeout period.

Syntax Description

seconds	Specifies a time in seconds.

Default

180 seconds.

Usage Guidelines

If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

Example

The following example sets the route timeout period to 120 seconds:

```
# configure rip routetimeout 120
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip updatetime

```
configure rip updatetime seconds
```

Description

Specifies the time interval in seconds within which *RIP* sends update packets.

Syntax Description

seconds	Specifies a time in seconds. The range is 10 to 180.

Default

30 seconds.

Usage Guidelines

The router exchanges an update message with each neighbor every 30 seconds (default value) or if there is a change to the overall routed topology (also called triggered updates). The timer granularity is 10 seconds. Timer minimum is 10 seconds and maximum is 180 seconds.

Example

The following command sets the update timer to 60 seconds:

```
# configure rip updatetime 60
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip vlan cost

```
configure rip vlan [vlan_name | all] cost cost
```

Description

Configures the cost (metric) of the interface.

Syntax Description

vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.
cost	Specifies a cost metric.

Default

The default setting is 1.

Usage Guidelines

The specified interface cost is added to the cost of the route received through this interface.

Example

The following command configures the cost for the VLAN finance to a metric of 3:

```
# configure rip vlan finance cost 3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip vlan route-policy

```
configure rip vlan [vlan_name | all] route-policy [in | out] [policy-
   name | none]
```

Description

Configures *RIP* to ignore certain routes received from its neighbor, or to suppress certain routes when performing route advertisements.

Syntax Description

vlan_name	Specifies a *VLAN* name.
all	Specifies all VLANs.
policy-name	Specifies a policy.
none	Removes any policy from the VLAN.

Default

N/A.

Usage Guidelines

Use the in option to configure an input route policy, which determines which RIP routes are accepted as valid routes. This policy can be combined with the trusted neighbor policy to accept selected routes only from a set of trusted neighbors.

Use the out option to configure an output route policy, which determines which RIP routes are advertised on the VLAN.

Example

The following command configures the VLAN backbone to accept selected routes from the policy nosales:

```
# configure rip vlan backbone route-policy in nosales
```

The following command uses the policy nosales to determine which RIP routes are advertised into the VLAN backbone:

```
# configure rip vlan backbone route-policy out nosales
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip vlan rxmode

```
configure rip [vlan vlan_name | all] rxmode [none | v1only | v2only |
   any]
```

Description

Syntax Description

vlan_name	Specifies to apply settings to specific *VLAN* name.
all	Specifies all VLANs.
none	Specifies to drop all received *RIP* packets.
v1only	Specifies to accept only RIP version 1 format packets.
v2only	Specifies to accept only RIP version 2 format packets.
any	Specifies to accept RIP version 1 and RIP version 2 packets.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the receive mode for the VLAN finance to accept only RIP version 1 format packets:

```
# configure rip finance rxmode v1only
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure rip vlan trusted-gateway

```
configure rip vlan [vlan_name | all] trusted-gateway [policy-name |
   none]
```

Description

Configures a trusted neighbor policy to determine trusted *RIP* router neighbors for the *VLAN* on the switch running RIP.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
policy-name	Specifies a policy.
none	Removes any trusted-gateway policy from the VLAN.

Default

N/A.

Usage Guidelines

Use this command to set a policy to determine trusted neighbors. A neighbor is defined by its IPaddress. Only the RIP control packets from trusted neighbors will be processed.

Example

The following command configures RIP to use the policy nointernet to determine from which RIP neighbor to receive (or reject) the routes to the VLAN backbone:

```
# configure rip vlan backbone trusted-gateway nointernet
```

History

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan txmode

```
configure rip [vlan vlan_name | all] txmode [none | v1only | v1comp |
   v2only]
```

Description

Changes the *RIP* transmission mode for one or all *VLAN*s.

Syntax Description

vlan_name	Specifies to apply settings to a specific VLAN name.
all	Specifies all VLANs.
none	Specifies to not transmit any packets on this interface.
v1only	Specifies to transmit RIP version 1 format packets to the broadcast address.
v1comp	Specifies to transmit RIP version 2 format packets to the broadcast address.
v2only	Specifies to transmit RIP version 2 format packets to the RIP multicast address.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the transmit mode for the VLAN finance to transmit version 2 format packets to the broadcast address:

```
# configure rip finance txmode v1comp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with a Base license or higher as described in the ***Switch Engine 32.2 Feature License Requirements*** document.

configure ripng add

```
configure ripng add [vlan vlan-name | tunnel tunnel-name | [vlan |
   tunnel] all]
```

Description

Configures *RIPng* on an IP interface.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or tunnels.

Default

N/A.

Usage Guidelines

For RIPng to be active on the interface, it must also be globally enabled using the command `disable ripng export [direct | ospfv3 | ospfv3-extern1 | ospfv3-extern2 | ospfv3-inter | ospfv3-intra | static | isis | isis-level-1| isis-level-1-external | isis-level-2| isis-level-2-external | bgp]`. If the keyword **all** is specified, all IPv6 configured VLANs or tunnels will be configured for RIPng.

Example

The following command configures RIPng on the VLAN finance:

```
configure ripng add finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng cost

`configure ripng [vlan vlan-name | tunnel tunnel-name] cost metric`

Description

Configures the cost (metric) of the interface..

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.
metric	Specifies a cost metric. Range is 1 to 15.

Default

The default setting is 1.

Usage Guidelines

The specified interface cost is added to the cost of the route received through this interface.

Example

The following command configures the cost for the VLAN finance to a metric of 3:

```
configure ripng vlan finance cost 3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng delete

```
configure ripng delete [vlan vlan-name | tunnel tunnel-name | [vlan |
   tunnel] all]
```

Default

Removes an interface from *RIPng* routing.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or tunnels.

Default

N/A.

Usage Guidelines

This command removes an interface from RIPng routing. However, the RIPng-specific interface configuration will be preserved, even if RIPng is unconfigured on the interface. The interface

configuration information is removed only when the IPv6 interface itself gets deleted by, for example, by unconfiguring all the IPv6 addresses on the interface.

Example

The following command removes the VLAN finance from RIPng routing:

```
configure ripng delete finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng garbagetime

```
configure ripng garbagetime {seconds}
```

Description

Configures the *RIPng* garbage time.

Syntax Description

seconds	Specifies a time in seconds. Range is 10 to 2400 seconds.

Default

120 seconds.

Usage Guidelines

This command configures the time interval after which a route in the RIPng routing database that has expired will be removed. The value is rounded off to nearest multiple of 10.

Example

The following command configures the RIPng garbage time to have a 60-second delay:

```
configure ripng garbagetime 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng import-policy

```
configure ripng import-policy [policy-name | none]
```

Description

Configures the import policy for *RIPng*.

Syntax Description

policy-name	Specifies the policy.

Default

No policy.

Usage Guidelines

Use this command to configure the policy to be applied to RIPng routes installed into the system routing table from the RIPng routing process. This policy can be used to modify parameters associated with routes installed into the routing table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove the import policy.

The following is a sample policy file that can be used with RIPng. It changes the metric to 12 for any routes from the subnets 2001:db8:2ccc::/64 and 2001:db8:2ccd::/64:

```
entry filter_routes {
        If match any{
            nlri 2001:db8:2ccc:: /64;
            nlri 2001:db8:2ccd:: /64;
        }
        then {
        cost 12;
        }
    }
```

Example

The following example applies the policy campuseast to RIPng routes:

```
configure ripng import-policy campuseast
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng route-policy

```
configure ripng [vlan vlan-name | tunnel tunnel-name] route-policy [in |
   out] [policy-name | none]
```

Description

Configures *RIPng* to ignore or modify certain routes received from its neighbors, or to suppress certain routes when performing route advertisements.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.
policy-name	Specifies a policy.
none	Removes any policy from the VLAN.

Default

N/A.

Usage Guidelines

Use the in option to configure an input route policy, which determines which RIPng routes are accepted as valid routes from RIPng neighbors. This policy can be combined with the trusted neighbor policy to accept selected routes only from a set of trusted neighbors.

Use the out option to configure an output route policy, which determines which RIPng routes are advertised to other RIPng neighbors.

The following is a sample policy file that could be used with RIPng. It will drop any routes from the subnets 2001:db8:2ccc::/64 and 2001:db8:2ccd::/64:

```
entry filter_routes {
    If match any{
        nlri 2001:db8:2ccc:: /64;
        nlri 2001:db8:2ccd:: /64;
    }
    then {
        deny;
    }
}
```

Example

The following command configures the VLAN backbone to accept routes from its neighbor as specified by the policy nosales:

```
configure ripng vlan backbone route-policy in nosales
```

The following command uses the policy nosales to determine which *RIP* routes are advertised into the VLAN backbone:

```
configure rip vlan backbone route-policy out nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng routetimeout

`configure ripng routetimeout` *`seconds`*

Description

Configures the route timeout period for *RIPng*.

Syntax Description

seconds	Specifies a time in seconds. Range is 10 to 3600.

Default

180 seconds.

Usage Guidelines

If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

The configured value is rounded off to the nearest multiple of 10.

Example

The following example sets the route timeout period to 120 seconds:

```
configure ripng routetimeout 120
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng trusted-gateway

```
configure ripng [vlan vlan-name | tunnel tunnel-name] trusted-gateway
   [policy-name | none]
```

Description

Configures a trusted neighbor policy to determine trusted *RIPng* router neighbors for the interfaces on the switch running RIPng.

Syntax Description

vlan-name	Specifies an IPv6 configured *VLAN*.
tunnel-name	Specifies an IPv6 tunnel.
policy-name	Specifies a policy.
none	Removes any trusted-gateway policy from the VLAN.

Default

None. Control packets from all of the neighbors are processed.

Usage Guidelines

Use this command to set a policy to determine trusted neighbors. A neighbor is defined by its IPaddress. Only the RIPng control packets from trusted neighbors will be processed.

The following policy designates neighbors from the fe80:202:b3ff:fe4a:6ada:: /64 subnet and the neighbor at fe80:203::b3ff:fe4a:6ada as trusted gateways:

```
entry filter_gateways {
    If match any{
        nlri fe80:202:b3ff:fe4a:6ada:: /64;
        nlri fe80:203::b3ff:fe4a:6ada:: /64;
    }
    then {
        permit;
    }
}
```

Example

The following command configures RIPng to use the policy nointernet to determine from which RIPng neighbor to receive (or reject) the routes to the VLAN backbone:

```
configure ripng vlan backbone trusted-gateway nointernet
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure ripng updatetime

```
configure ripng updatetime seconds
```

Description

Specifies the time interval in seconds within which *RIPng* sends update packets.

Syntax Description

seconds	Specifies a time in seconds. The range is 10 to 3600.

Default

30 seconds.

Usage Guidelines

The router exchanges an update message with each neighbor every 30 seconds (default value), or if there is a change to the overall routed topology (also called triggered updates). The timer granularity is 10 seconds. Timer minimum is 10 second and maximum is 3600 seconds.

Example

The following command sets the update timer to 60 seconds:

```
configure ripng updatetime 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, see the *Switch Engine 32.2 Feature License Requirements* document.

configure switch safe-default-script

```
configure switch safe-default-script
```

Description

Allows you to change management access to your device and to enhance security.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command runs an interactive script that prompts you to choose to enable or disable *SNMP*, Telnet, and enabled ports.

Refer to "Using Safe Defaults Mode" in the *Switch Engine 32.2 User Guide* for complete information on the safe default mode.

After you issue this command, the system presents you with the following interactive script:

```
 Telnet is enabled by default. Telnet is unencrypted and has been the target of security
exploits in the past. Would you like to disable Telnet? [y/N]: SNMP access is enabled
by default. SNMP uses no encryption, SNMPv3 can be configured to eliminate this problem.
Would you like to disable SNMP? [y/N]: All ports are enabled by default. In some secure
applications, it maybe more desirable for the ports to be turned off. Would you like
unconfigured ports to be turned off by default? [y/N]: Changing the default failsafe
account username and password is highly recommended. If you choose to do so, please
remember the username and password as this information cannot be recovered by Extreme
Networks. Would you like to change the failsafe account username and password now? [y/N]:
Would you like to permit failsafe account access via the management port? [y/N]: Since you
have chosen less secure management methods, please remember to increase the security of
your network by taking the following actions: * change your admin password * change your
```

```
failsafe account username and password * change your SNMP public and private strings *
consider using SNMPv3 to secure network management traffic
```

Example

The following command reruns the interactive script to configure management access:

```
configure switch safe-default-script
```

History

This command was first available in ExtremeXOS 11.2.

The **switch** keyword was added in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure security fips-mode

```
configure security fips-mode [on | off]
```

Description

This command enables you to toggle between the default OpenSSL library (FIPS compatible) and FIPS capable library.

Syntax Description

on	Enables FIPS mode.
off	Disable FIPS mode.

Default

Off.

Usage Guidelines

After enabling/disabling FIPS, EPM will be notified to change the bit dedicated to FIPS Mode. As per requirement, currently SSH and *SNMP* will use this bit to toggle between normal and FIPS mode.

Example

```
# sh security fips-mode
FIPS Mode (current)    : Off
FIPS Mode (configured) : Off

# configure security fips-mode on
```

```
FIPS mode will be enabled only after rebooting the switch.
SNMPv3 users configured with either md5 authentication or DES encryption will be
discarded after reboot.
SSH existing configuration of ciphers/MACs will be lost after reboot.
Python scripting configuration is ignored when FIPS mode is 'on'.

# show security fips-mode
FIPS Mode (current)    : On
FIPS Mode (configured) : On
```

History

This command was first available in ExtremeXOS 21.1.

Current and configured information added in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure security python

```
configure security python [on | off]
```

Description

Turns on or off external Python scripting support when FIPS mode is turned off.

Syntax Description

on	Turns on external Python scripting support (default).
off	Turns off external Python scripting support.

Default

By default, when FIPS mode is off, external Python scripting support is enabled.

Usage Guidelines

To enable external Python scripting support with the command, FIPS mode must be turned off (`configure security fips-mode [on | off]`). Python scripting configuration is ignored when FIPS mode is turned on.

Example

The following example turns off external Python scripting support:

```
# configure security python off
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow agent ipaddress

```
configure sflow agent {ipaddress} ipaddress
```

Description

Configures the sFlow agent's IP address.

Syntax Description

ipaddress	Specifies the IP address from which sFlow data is sent on the switch.

Default

The default configured IP address is 0.0.0.0, but the effective IP address is the management port IP address.

Usage Guidelines

This command allows you to configure the IP address of the sFlow agent. Typically, you would set this to the IP address used to identify the switch in the network management tools that you use. The agent address is stored in the payload of the sFlow data, and is used by the sFlow collector to identify each agent uniquely. The default configured value is 0.0.0.0, but the switch will use the management port IP address if it exists.

Both the commands `unconfigure ports monitor vlan` and `unconfigure sflow agent` will reset the agent parameter to the default.

Example

The following command sets the sFlow agent's IP address to 10.2.0.1:

```
configure sflow agent ipaddress 10.2.0.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow collector ipaddress

```
configure sflow collector {ipaddress} ipaddress {port udp-port-number}
   {vr vr_name}
```

Description

Configures the sFlow collector IP address.

Syntax Description

ipaddress	Specifies the IP address to send the sFlow data.
udp-port-number	Specifies the UDP port to send the sFlow data.
vr_name	Specifies from which virtual router to send the sFlow data. Note: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.

Default

The following values are the defaults for this command:

- UDP port number—6343
- Virtual router—*VR-Mgmt* (previously called VR-0)

Usage Guidelines

This command allows you to configure where to send the sFlow data. You must specify an IP address for the sFlow data collector, and you may specify a particular UDP port, if your collector uses a non-standard port. You may also need to specify from which virtual router to send the data.

You can configure up to four sFlow collectors. Each unique IP address/UDP port/virtual router combination identifies a collector.

Both the commands `unconfigure ports monitor vlan` and `unconfigure sflow collector` will reset the collector parameters to the default.

Example

The following command specifies that sFlow data should be sent to port 6343 at IP address 192.168.57.1 using the virtual router VR-Mgmt:

```
configure sflow collector ipaddress 192.168.57.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow max-cpu-sample-limit

```
configure sflow max-cpu-sample-limit rate
```

Description

Configures the maximum number of sFlow samples handled by the CPU per second.

Syntax Description

rate	Specifies the maximum sFlow samples per second.

Default

The default value is 2000 samples per second.

Usage Guidelines

This command configures the maximum number of samples sent to the CPU per second. If this rate is exceeded, the internal sFlow CPU throttling mechanism kicks in to limit the load on the CPU.

Every time the limit is reached, the sample rate is halved (the value of number in the `configure sflow sample-rate number` or `configure sflow ports port_list sample-rate number` command is doubled) on the slot (SummitStack) or ports (stand-alone switch) on which maximum number of packets were received during the last snapshot.

This effectively halves the sampling frequency of all the ports on that slot or stand-alone switch with a sub-sampling factor of 1. The sampling frequency of ports on that slot or stand-alone switch with a sub-sampling factor greater than 1 will not change; the sub-sampling factor is also halved so the that the same rate of samples are sent from that port.

The maximum CPU sample rate is based on the total number of samples received from all the sources. The valid range is 100 to 200000 samples per second.

Example

The following command specifies that the sFlow maximum CPU sample rate should be set to 4000 samples per second:

```
configure sflow max-cpu-sample-limit 4000
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow poll-interval

```
configure sflow poll-interval seconds
```

Description

Configures the sFlow counter polling interval.

Syntax Description

seconds	Specifies the number of seconds between polling each counter. The value can range from 0 to 3600 seconds.

Default

The default polling interval is 20 seconds.

Usage Guidelines

Each sFlow statistics counter is polled at regular intervals, and this data is then sent to the sFlow collector. This command is used to set the polling interval. To manage CPU load, polling for sFlow enabled ports are distributed over the polling interval, so that all ports are not polled at the same instant. For example, if the polling interval is 20 seconds and there are twenty counters, data is collected successively every second.

Specifying a poll interval of 0 (zero) seconds disables polling.

Example

The following command sets the polling interval to 60 seconds:

```
configure sflow poll-interval 60
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow ports sample-rate

```
configure sflow ports port_list sample-rate number
```

Description

Configures the sFlow per-port sampling rate.

Syntax Description

port_list	Specifies a list of ports.
number	Specifies the fraction (1/number) of packets to be sampled.

Default

The default number is 8192, unless modified by the `configure sflow sample-rate` command.

Usage Guidelines

This command configures the sampling rate on a particular set of ports, and overrides the system-wide value set in the `configure sflow sample-rate` command. The rate is rounded off to the next power of two, so if 400 is specified, the sample rate is configured as 512. The valid range is 256 to 536870912.

All ports on the switch are sampled individually.

Example

The following command sets the sample rate for the ports 4:6 to 4:10 to one packet out of every 16384:

```
configure sflow ports 4:6-4:10 sample-rate 16384
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sflow sample-rate

```
configure sflow sample-rate number
```

Description

Configures the sFlow default sampling rate.

Syntax Description

number	Specifies the fraction (1/number) of packets to be sampled.

Default

The default number is 8192.

Usage Guidelines

This command configures the default sampling rate. This is the rate that newly enabled sFlow ports will have their sample rate set to. Changing this rate will not affect currently enabled sFlow ports. The rate is rounded off to the next power of two, so if 400 is specified, the sample rate is configured as 512. The valid range is 256 to 536870912.

Configuring a lower number for the sample rate means that more samples will be taken, increasing the load on the switch. Do not configure the sample rate to a number lower than the default unless you are sure that the traffic rate on the source is low.

The minimum rate that these platforms sample is 1 out of every 256 packets. If you configure a rate to be less than 256, the switch automatically rounds up the sample rate to 256.

Example

The following example sets the sample rate to one packet out of every 16384:

```
configure sflow sample-rate 16384
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing add ports

```
configure sharing port slot slot distribution-list [port_list | add
   port_list | all]
```

Description

Adds ports to a load-sharing, or link aggregation, group. By using link aggregation, you use multiple ports as a single logical port. Link aggregation also provides redundancy because traffic is redistributed to the remaining ports in the *LAG* if one port in the group goes down.

Syntax Description

port	Specifies the logical port for a load-sharing group or link aggregation group (LAG). This number also functions as the LAG Group ID.
port_list	Specifies one or more ports or slots and ports to be grouped in the LAG.
add	Adds a port list to the existing distribution port list for the given slot.
all	All active members of the group are eligible for distribution for packets received on the given slot. This is the existing behavior and the default. This option effectively deletes any existing configured port list for the slot.

Default

N/A.

Usage Guidelines

Use this command to dynamically add ports to a load-sharing group, or link aggregation group (LAG).

Note
You must create a LAG (or load-sharing group) before you can configure the LAG. To create a LAG, see enable sharing grouping on page 2296.

VMAN ports can belong to LAGs. If any port in the LAG is enabled for VMAN, all ports in the group are automatically enabled to handle jumbo size frames. Also, VMAN is automatically enabled on all ports of the untagged LAG.

To verify your configuration, use the `show ports sharing` command.

Note
All ports that are designated for the LAG must be removed from all VLANs prior to configuring the LAG.

ExtremeSwitching Series Switches

The following guidelines apply to link aggregation on the ExtremeSwitching series switches:

- One static LAG can contain up to 8 ports.
- An LACP LAG can include a maximum of 16 ports; out of these up to 8 can be selected links and the remaining 8 will be standby links.
- A Health Check LAG can contain up to 8 ports.

SummitStack only

The following guidelines apply to link aggregation:

- A static LAG can include a maximum of 8 ports.
- An LACP LAG can include a maximum of 16 ports; out of these up to 8 can be selected links and the remaining 8 will be standby links.

- A Health Check LAG can include a maximum of 8 ports.

Example

The following example adds port 3 to the LAG with the logical port 4 on a switch:

```
configure sharing 3 add port 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing address-based custom

```
configure sharing address-based custom [ipv4 [source-only | destination-
   only | source-and-destination] | hash-algorithm [xor | crc-16 |
   crc-32 [lower | upper]]]
```

Description

This command configures the part of the packet examined by the switch when selecting the egress port for transmitting link aggregation, or load-sharing, data.

Syntax Description

ipv4	IPv4 hash configuration for custom load sharing and L2VPN sharing.
source-only	Indicates that the switch should examine the IP source address only.
destination-only	Indicates that the switch should examine the IP destination address only.
source-and-destination	Indicates that the switch should examine the IP source and destination address.
hash-algorithm	Hash algorithm for custom load sharing and L2VPN sharing.
xor	Use exclusive-OR for load sharing hash computation.
crc-16	Use CRC-16 for load sharing hash computation.
crc-32	Use CRC-32 for load sharing hash computation.
lower	Use lower 16 bits of CRC32 for load sharing hash computation.
upper	Use upper 16 bits of CRC32 for load sharing hash computation.

Default

Algorithm: source-and-destination.

Hash algorithm: xor.

Usage Guidelines

This command specifies the part of the packet header that the switch examines to select the egress port for address-based load-sharing trunks. The address-based load-sharing setting is global and applies to all load-sharing trunks, or LAGs, that are address-based and configured with a custom algorithm. You change this setting by issuing the command again with a different option.

The addressing information examined is based on the packet protocol as follows:

- IPv4 packets—Uses the source and destination IPv4 addresses and Layer4 port numbers as specified with this command.
- IPv6 packets—Uses the source and destination IPv6 addresses and Layer4 port numbers.
- *MPLS* packets—Uses the top, second, and reserved labels and the source and destination IP addresses.
- Non-IP Layer 2—Uses the *VLAN* ID, the source and destination MAC addresses, and the ethertype.

The xor hash algorithm guarantees that the same egress port is selected for traffic distribution based on a pair of IP addresses, Layer4 ports, or both, regardless of which is the source and which is the destination.

For IP-in-IP and GRE tunneled packets, the switch examines the inner header to determine the egress port.

To verify your configuration, use the `show ports sharing` command.

Example

The following example configures the switch to examine the source IP address:

```
# configure sharing address-based custom ipv4 source-only
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is supported on the ExtremeSwitching 5520 platform.

configure sharing address-based custom hash-seed

`configure sharing` **`address-based custom hash-seed`** [*seed* | **`switch-mac-address`**]

Description

Configures the hash seed used in the CRC hashing algorithms of the “custom” load sharing algorithm.

Syntax Description

address-based	Selects address-based sharing.
custom	Configuration for address-based custom load sharing and L2VPN sharing.
hash-seed	Selects configuring hash seed used with CRC hash algorithms.
seed	Sets the hash seed value. Prior to ExtremeXOS22.5, the default value was 0x7F2193EA.
switch-mac-address	Use the last four bytes of the switch's MAC address to create a unique seed value (Default).

Default

The default is **switch-mac-address**.

Usage Guidelines

The default configuration of the hash seed is **switch-mac-address**, which uses the last four bytes of the switch's MAC address as the hash seed to provide a unique seed value on all Extreme Networks switches in the network. Such a configuration prevents hash polarization in MLAG network configurations by default.

Prior to supporting configuring the hash seed (ExtremeXOS 30.1), the default value of the hash seed was 0x7F2193EA. You can restore the legacy default behavior for the hash seed by explicitly configuring this legacy value.

To verify your hash seed configuration, use the `show` **ports** *port_list* **sharing distribution configuration** or `show` {**port** *port_number*} **sharing** {**detail**} commands.

Example

The following example sets the hash seed value to "123456789":

```
configure sharing address-based custom hash-seed 123456789
```

History

This command was first available in ExtremeXOS 30.1.

Platform Availability

This command is supported on the ExtremeSwitching 5520 platform.

configure sharing algorithm

`configure sharing` *master_port* **algorithm** [**address-based** [**L2** | **L3** | **L3_L4** | **custom**] | **port-based**]

Description

Modifies the distribution algorithm of an existing *LAG*.

Syntax Description

master_port	Specifies the master logical port for the load-sharing group or LAG.
algorithm	Specifies modifying the distribution algorithm of an existing LAG.
address-based	Specifies link aggregation by address-based algorithm.
L2	Specifies address-based link aggregation by Layer 2. This is the default.
L3	Specifies address-based link aggregation by Layer 3.
L3_L4	Specifies address-based link aggregation by Layer 3 IP plus Layer 4 port.
custom	Selects the custom link aggregation algorithm configured with the following command: `configure sharing address-based custom [ipv4 [L3-and-L4 | source-only | destination-only | source-and-destination] | hash-algorithm [xor | crc-16]]`. The configuration of the custom option applies to all LAGs on the switch.
port-based	Selects port-based load sharing groups.

Default

Address-based link aggregation by Layer 2 is the default.

Usage Guidelines

This command allows you to modify the distribution algorithm of an existing LAG, created using the command enable sharing grouping on page 2296.

If you select the **custom** option, you configure the customer link aggregation algorithm with the following command: `configure sharing address-based custom [ipv4 [L3-and-L4 | source-only | destination-only | source-and-destination] | hash-algorithm [xor | crc-16]]`

Since the custom and port-based algorithms may not be used at the same time, changing the algorithm on multiple groups between the custom and port-based algorithms requires changing the algorithm on these groups to either L2, L3, or L3_L4 as an intermediate step.

Example

The following example sets the distribution algorithm for the LAG on port 24 to address-based link aggregation by Layer 3 IP plus Layer 4 port:

```
# configure sharing 24 algorithm address-based L3_L4
```

History

This command was first available in ExtremeXOS 22.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing delete ports

```
configure sharing port slot slot distribution-list [port_list | delete
   port_list | all]
```

Description

Deletes ports from a link aggregation, or load-sharing, group.

Syntax Description

port	Specifies the logical port for a load-sharing group or a *LAG*. This number also functions as the LAG Group ID.
port_list	Specifies one or more ports or slots and ports to be grouped in the LAG.

Default

N/A.

Usage Guidelines

Use this command to dynamically delete ports from a load-sharing group, or link aggregation group (LAG). This command applies to static and dynamic link aggregation.

Example

The following example deletes port 3:12 from the LAG with the logical port, or LAG Group ID, 3:9:

```
configure sharing 3:9 delete port 3:12
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing distribution-mode

```
configure sharing master_port distribution-mode [all | local-slot |
   port-lists]
```

Description

This command provides two different configuration options for specifying subsets of active member ports as eligible for distribution. Both of these options specify a subset of the active member ports on a per slot basis. The specific choice of configuration is described in the CLI as a “distribution-mode”. The choice of distribution mode is configurable per *LAG*.

Syntax Description

all	All active members of the group are eligible for distribution on all slots in the switch. This is the existing behavior and the default.
local-slot	If there are one or more active members of the group on the slot where traffic is received, distribution will be restricted to these “local-slot” members.
port-lists	If there are one or more active members of the group in the configured distribution port list for the slot on which traffic is received, distribution will be restricted to these configured ports.

Default

All.

Usage Guidelines

The “local-slot” distribution mode restricts distribution of unicast packets to the active LAG members on the same slot where the packet was received. If no active LAG members are present on the slot where the packet was received, all active LAG member ports are included in the distribution algorithm. The “local-slot” distribution mode may be specified during LAG creation with the “enable sharing” CLI command. It may also be configured dynamically with the “configure sharing” command. This distribution mode is self-configuring in the sense that no configuration is required other than the specification of the “local-slot” distribution mode. Addition or deletion of LAG member ports via the “configure sharing <master_port> [add | delete] <port_list>” command is automatically handled. The “local-slot” distribution mode is useful for reducing the fabric bandwidth load of a switch.

Example

```
# show sharing distribution configuration
Config   Distribution Distribution
Master   Mode         Lists
================================================================================
1:1      Port Lists   Slot 1: 1:1-10, 1:15
                      Slot 5: 1:11-22
1:25     Local Slot   Slot 1: 1:25
                      Slot 5: 1:26
5:1      Port Lists
```

```
5:10     All          Slot 1: 5:11
                      Slot 5: 5:10
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on SummitStack switches.

configure sharing health-check member-port add tcp-tracking

```
configure sharing health-check member-port port add tcp-tracking IP
   Address {tcp-port TC Port frequency sec misses count}
```

Description

Configures monitoring for each member port of a health check *LAG*.

Syntax Description

port	Specifies the member port.
IP Address	Specifies the IP address to monitor.
TCP Port	Specifies the TCP port to watch. The default is port 80.
sec	Specifies the frequency in seconds at which tracking takes place. The default is 10 seconds.
count	Specifies the number of misses before a connection loss is reported. The default is 3 misses.

Default

N/A.

Usage Guidelines

To configure a health check LAG, you first create a health check type of LAG using the `enable sharing grouping` command. Then use this command to configure the monitoring for each member port. You can configure each member port to track a particular IP address, but only one IP address per member port.

To display the monitoring configuration for a health check LAG, use the `show sharing health-check` command.

To display the link aggregation configured on a switch, use the `show ports sharing` command.

Example

The following commands configure four different member ports:

```
# configure sharing health-check member-port 10 add track-tcp 10.1.1.1 tcp-port 23
# configure sharing health-check member-port 11 add track-tcp 10.1.1.2 tcp-port 23
# configure sharing health-check member-port 12 add track-tcp 10.1.1.3
# configure sharing health-check member-port 13 add track-tcp 10.1.1.4
```

When the TCP port, seconds, or counts are not specified, they default to the values described in the Syntax Description.

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing health-check member-port delete tcp-tracking

```
configure sharing health-check member-port port delete tcp-tracking IP
   Address {tcp-port TC Port}
```

Description

Unconfigures monitoring for each member port of a health check *LAG*.

Syntax Description

port	Specifies the member port.
IP Address	Specifies the IP address.
TCP Port	Specifies the TCP port.

Default

N/A.

Usage Guidelines

Use this command to remove the monitoring configuration on the ports of a health check link aggregation group. Each port must be unconfigured separately, specifying the IP address and TCP port.

Example

The following command removes the configuration setting on port 12 that monitors IP address 10.1.1.3:

```
# configure sharing health-check member-port 12 delete track-tcp 10.1.1.3
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing health-check member-port tcp-tracking

```
configure sharing health-check member-port port [disable | enable] tcp-
   tracking
```

Description

Enables or disables configured monitoring on a member port of a health check *LAG*.

Syntax Description

port	Specifies the member port.

Default

N/A.

Usage Guidelines

This disables/enables monitoring on a particular member port. When monitoring is disabled, the member port is added back to the LAG if it has not already been added. This allows a member port to be added back to LAG even though connectivity to the host is down.

Example

The following command disables port 12:

```
configure sharing health-check member-port 12 disable tcp-tracking
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp activity-mode

```
configure sharing port lacp activity-mode [active | passive]
```

Description

Configures whether the switch sends LACPDUs periodically (active) or only in response to LACPDUs sent from the partner on the link (passive).

Syntax Description

port	Specifies the master logical port for the *LAG* you are setting the activity mode for.
active	Enter this value to have the switch periodically sent LACPDUs for this LAG.
passive	Enter this value to have the switch only respond to LACPDUs for this LAG.

Default

Active.

Usage Guidelines

You must enable sharing and create the LAG prior to assigning this LACP activity mode.

Note

One side of the link must be in active mode in order to pass traffic. If you configure your side in the passive mode, ensure that the partner link is in LACP active mode.

To verify the LACP activity mode, use the `show lacp lag group-id detail` command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

In ExtremeXOS version 11.3, the activity mode cannot be changed from active.

Example

The following command changes the activity mode to passive for the specified LAG group ID:

```
configure sharing 5:1 lacp activity-mode passive
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp defaulted-state-action

`configure sharing` *port* **lacp defaulted-state-action** [**add** | **delete**]

Description

Configures a defaulted *LAG* port to be removed from the aggregator.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the default action for.
add	Enter this value to have the switch add defaulted ports to the aggregator for this LAG.
delete	Enter this value to have the switch delete defaulted ports from the aggregator for this LAG.

Default

Delete.

Usage Guidelines

You must enable sharing and create the LAG prior to configuring this LACP parameter.

You can configure whether you want a defaulted LAG port removed from the aggregator or added back into the aggregator. If you configure the LAG to remove ports that move into the default state, those ports are removed from the aggregator and the port state is set to unselected.

Note

In ExtremeXOS version 11.3, defaulted ports in the LAG are always removed from the aggregator; this is not configurable.

If you configure the LAG to add the defaulted port into the aggregator, the system takes inventory of the number of ports currently in the aggregator:

- If there are fewer ports in the aggregator than the maximum number allowed, the system adds the defaulted port to the aggregator (port set to selected and collecting-distributing).
- If the aggregator has the maximum ports, the system adds the defaulted port to the standby list (port set to standby).

Note

If the defaulted port is assigned to standby, that port automatically has a lower priority than any other port in the LAG (including those already in standby).

To verify the LACP default action, use the `show lacp lag group-id detail` command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

To force the LACP trunk to behave like a static sharing trunk, use this command to add ports to the aggregator.

Example

The following command deletes defaulted ports from the aggregator for the specified LAG group ID:

```
configure sharing 5:1 lacp defaulted-state-action delete
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp fallback

`configure sharing port lacp fallback [enable | disable]`

Description

This command provides the ability to configure fallback. If fallback is enabled and LACP PDUs are not received on LACP-configured ports within the timeout period, the port with the lowest priority value will be added to the aggregator. The port stays in this state until fallback is disabled or until LACP PDUs are exchanged between the switch and its link partner, causing *LAG* reconfiguration.

Syntax Description

port	LAG group ID.
fallback	Allow a single member port with lowest value priority to be added to the aggregator is LACP PDUs are not received within timeout.
enable	Enable fallback. Port priority and fallback timeout control port aggregator membership.
disable	Disable fallback. LACP PDUs or defaulted-state-action control port aggregator membership.

Default

Disabled.

Example

```
* # show lacp lag 17 detail
Lag   Actor    Actor  Partner           Partner  Partner Agg   Actor
      Sys-Pri  Key    MAC               Sys-Pri  Key     Count MAC
--------------------------------------------------------------------------------
17          0  0x03f9 00:00:00:00:00:00       0  0x0000      1 00:04:96:6d:55:13
Enabled          : Yes
LAG State        : Up
Unack count      : 0
Wait-for-count   : 0
Current timeout  : Long
Activity mode    : Active
Defaulted Action : Delete
Fallback         : Enabled
Fallback timeout : 40 seconds
Receive state    : Enabled
Transmit state   : Enabled
Minimum active   : 1
Selected count   : 1
Standby count    : 0
LAG Id flag      : Yes
  S.pri:0   , S.id:00:04:96:6d:55:13, K:0x03f9
  T.pri:0   , T.id:00:00:00:00:00:00, L:0x0000

Port list:
Member     Port     Rx           Sel          Mux            Actor     Partner
Port       Priority State        Logic        State          Flags     Port
--------------------------------------------------------------------------------
17         10       Initialize   Unselected   Detached       A-G-----  0
18         5        Initialize   Fallback     Collect-Dist   A-GSCD--  1018
19         5        Idle         Unselected   Detached       --------  0
================================================================================
Actor Flags: A-Activity, T-Timeout, G-Aggregation, S-Synchronization
             C-Collecting, D-Distributing, F-Defaulted, E-Expired
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp fallback timeout

```
configure sharing port lacp fallback timeout seconds
```

Description

This command configures the LACP fallback timeout value in seconds.

Syntax Description

lacp	LACP (Link Aggregation Control Protocol).
fallback	Allow single member port with lowest value priority to be added to the aggregator if LACP PDUs are not received within timeout.
timeout	Timeout used to determine how long to wait for LACP PDUs before entering fallback.
seconds	Fallback timeout in seconds. Range 0-100.

Default

60 seconds.

Example

```
* # show lacp lag 17 detail
Lag   Actor    Actor  Partner           Partner  Partner Agg   Actor
      Sys-Pri  Key    MAC               Sys-Pri  Key     Count MAC
--------------------------------------------------------------------------------
17          0  0x03f9 00:00:00:00:00:00       0  0x0000      1 00:04:96:6d:55:13
Enabled          : Yes
LAG State        : Up
Unack count      : 0
Wait-for-count   : 0
Current timeout  : Long
Activity mode    : Active
Defaulted Action : Delete
Fallback         : Enabled
Fallback timeout : 40 seconds
Receive state    : Enabled
Transmit state   : Enabled
Minimum active   : 1
Selected count   : 1
Standby count    : 0
LAG Id flag      : Yes
  S.pri:0   , S.id:00:04:96:6d:55:13, K:0x03f9
  T.pri:0   , T.id:00:00:00:00:00:00, L:0x0000

Port list:
Member     Port     Rx           Sel          Mux           Actor     Partner
Port       Priority State        Logic        State         Flags     Port
```

```
--------------------------------------------------------------------------------
17         10       Initialize   Unselected   Detached       A-G-----  0
18         5        Initialize   Fallback     Collect-Dist   A-GSCD--  1018
19         5        Idle         Unselected   Detached       --------  0
================================================================================
Actor Flags: A-Activity, T-Timeout, G-Aggregation, S-Synchronization
             C-Collecting, D-Distributing, F-Defaulted, E-Expired
```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp system-priority

`configure sharing` *port* **`lacp system-priority`** *priority*

Description

Configures the system priority used by LACP for each *LAG* to establish the station on which end assumes priority in determining those LAG ports moved to the collecting/distributing state of the protocol. That end of the LAG with the lowest system priority is the one that assumes control of the determination. This is optional; if you do not configure this parameter, LACP uses system MAC values to determine priority. If you choose to configure this parameter, enter a value between 1 and 65535.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the priority for.
priority	Enter the value you want for the priority of the system for the LACP. The range is 0 to 65535; there is no default.

Default

N/A.

Usage Guidelines

The LACP uses the system MAC values to assign priority to one of the systems, and that system then determines which LAG ports move into the collecting/distributing state and exchange traffic. That end of the LAG with the lowest system priority is the one that assumes control of the determination. If you wish to override the default LACP system priority for a specific LAG, use this command to assign that LAG a specific LACP priority. Enter a value between 0 and 65535.

You must enable sharing and create the LAG prior to assigning this LACP priority.

To verify the LACP system priority, use the `show lacp` command.

To change the system priority you previously assigned to a specific LAG, issue the `configure sharing lacp system-priority` command using the new priority you want. To remove the assigned system priority entirely and use the LACP priorities, issue the `configure sharing lacp system-priority` command using a value of 0.

Example

The following command assigns LAG 10 an LACP system priority of 3:

```
configure sharing 10 lacp system-priority 3
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing lacp timeout

`configure sharing` *port* **`lacp timeout`** [**`long`** | **`short`**]

Description

Configures the timeout used by each *LAG* to stop transmitting once LACPDUs are no longer received from the partner link. You can configure this timeout value to be either 90 seconds, long, or 3 seconds, short.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the timeout value for.
long	Enter this value to use 90 seconds as the timeout value.
short	Enter this value to use 3 seconds as the timeout value.

Default

Long.

Usage Guidelines

You must enable sharing and create the LAG prior to assigning this LACP timeout value.

To verify the LACP timeout value, use the `show lacp lag` *group-id* `detail` command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

In ExtremeXOS version 11.3, the timeout value is set to long and cannot be changed.

Example

The following command changes the timeout value for the specified LAG group ID to short:

```
configure sharing 5:1 lacp timeout short
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sharing minimum-active

`configure sharing` *`port`* **`minimum-active`** *`min_links_active`*

Description

This command allows you to configure a value for the minimum number of active links to keep the entire *LAG* up.

Syntax Description

`sharing`	Load sharing.
`port`	Master port.
`minimum-active`	Minimum active links for group to remain in service.
`min_links_active`	Number of active links. Default is 1. Range is 1 – 8.

Default

1

Usage Guidelines

Use this command to configure the value for the minimum number of active links to keep the LAG up.

Example

The following example display output from the `show port port sharing` command using minimum active links:

```
# sh ports 14 sharing
Load Sharing Monitor
Config  Current  Agg       Min    Ld Share   Ld Share   Agg    Link    Link Up
Master  Master   Control   Active Algorithm  Group      Mbr    State   Transitions
================================================================================
    14            Static       2      L2          14       -       R         0
                                      L2          15       Y       A
1
                                      L2          16       -       R         0
================================================================================
Link State: A-Active, D-Disabled, R-Ready, NP-Port not present, L-Loopback
Minimum Active: (<) Group is down. # active links less than configured minimum
Load Sharing Algorithm: (L2) Layer 2 address based, (L3) Layer 3 address based
                        (L3_L4) Layer 3 address and Layer 4 port based
                        (custom) User-selected address-based configuration
Custom Algorithm Configuration: ipv4 L3-and-L4, xor
Number of load sharing trunks: 2 (1 displayed)
```

History

This command was first available in ExtremeXOS 15.7.

Platform Availability

All ExtremeXOS-based platforms that support static LAG and LACP are supported.

configure sharing port-based key

`configure sharing [ load_sharing_key | default] ports port_list`

Description

Sets the *load_sharing_key* for all ports in the *port_list*.

Syntax Description

load_sharing_key	Specifies the load sharing key. Valid load sharing keys are in the range [0-15].
default	Unconfigures and resets the load sharing keys for ports in the *port_list* to default values.
ports	Specifies the logical port for a load-sharing group.
port_list	Specifies one or more ports or slots and ports to be grouped in the *LAG*.

Default

N/A.

Usage Guidelines

This command sets the *load_sharing_key* for all ports in the *port_list*. **default** unconfigures and resets the load sharing keys for ports in *port_list* to default values.

Configured load sharing keys are displayed in the output of the `show configuration hal` command. Both configured and default load sharing keys are displayed in the output of the "show sharing port-based keys" command.

Example

The following example causes all packets received on ports in slot 1 to choose the lowest port number in all aggregators for distribution.:

```
configure sharing port-based key 0 ports 1
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure slot description

`configure` **`slot`** *`slot`* **`description`** [*`slot_description`* | **`none`**]

Description

Adds or removes a descriptive name to a slot.

Syntax Description

`slot`	Specifies a specific port extender by slot number.
`slot`	Specifies a specific port extender by slot number.
`description`	Specifies naming the BPE at the designated slot.
`slot_description`	Name for the BPE at the designated slot (max. of 64 characters long).
`none`	Specifies removing the current name assigned to the BPE at the designated slot.

Default

N/A.

Usage Guidelines

To remove a name from a slot, use the **`none`** option.

The slot name can be up to 64 characters long.

To view a slot's name, use any of the following commands:

- `show slot {slot {detail} | detail }`
- `show vpex bpe`
- `show vpex bpe {slot slot_num} {statistics} {detail}`
- `show vpex bpe {slot slot_num} {environment}`

Example

The following example applies the name "Accounting Dept" to the BPE at slot 100:

```
configure slot 100 description Accounting Dept
```

History

This command was first available in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure slot module

`configure slot slot module module_type`

Description

Configures a slot for a particular type of node.

Syntax Description

slot	Specifies the slot number.
module_type	The particular switch in the SummitStack.

Usage Guidelines

The `configure sharing lacp timeout` command displays different switch parameters depending on the type of switch you are configuring and the version of ExtremeXOS running on the switch.

Upon powering up the stack, ExtremeXOS automatically determines the system power budget and protects the switch from any potential overpower configurations. If power is available, ExtremeXOS powers on and initializes the nodes in the stack. When ExtremeXOS detects that a node will cause an overpower condition, the node remains powered down, and is not initialized. An entry is made to the system log indicating the condition.

The module type must be a switch that supports SummitStack.

Example

The following command configures slot 2 in a stack for a ExtremeSwitching 5520-24T switch:

```
# configure slot 2 module 5520-24T
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure slot restart-limit

`configure slot` *slot_number* **restart-limit** *num_restarts*

Description

Configures the number of times a slot can be restarted on a failure before it is shut down.

Syntax Description

slot_number	Specifies the slot number.
num_restarts	Specifies the number of times the slot can be restarted. The range is from 0 to 10,000.

Default

The default is 5.

Usage Guidelines

This command allows you to configure the number of times a slot can be restarted on a failure before it is shut down. If the number of failures exceeds the restart-limit, the module goes into a “Failed” state. If that occurs, use the `disable slot` and `enable slot` commands to restart the module.

Example

The following command configures slot 2 on the switch to be restarted up to 3 times upon a failure:

```
configure slot 2 restart-limit 3
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on SummitStack.

configure slpp guard ethertype

```
configure slpp guard ethertype hex
```

Description

Configures the Ethertype that the Simple Loop Protection Protocol (SLPP) Guard feature uses to identify SLPP PDUs.

Syntax Description

slpp	Specifies configuring SLPP.
guard	Specifies disabling a port as soon as an SLPP PDU is received.
ethertype	Specifies selecting the Ethertype used by PDUs of the SLPP protocol.
hex	Specifies the Ethertype value in hexadecimal [0x0600-0xffff]. The default is 0x8102.

Default

By default, the Ehtertype is 0x8102.

Usage Guidelines

SLPP is an application that detects loops in a Split Multi-link Trunking (SMLT) network. SLPP Guard is a complementary feature that helps prevent loops in networks by administratively disabling an edge port if a switch receive an SLPP PDU from an SMLT network.

This command configures the Ethernet type field of the packet that SLPP Guard uses to identify SLPP PDUs.

Example

The following example configures the SLPP Guard Ethertype as 0x8110:

```
# configure slpp guard ethertype 0x8110
```

History

This command was available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure slpp guard recovery-timeout

```
configure slpp guard [ports [port_list | all] recovery-timeout [seconds
    | none]
```

Description

Configures the recovery timeout period for the Simple Loop Protection Protocol (SLPP) Guard feature.

Syntax Description

slpp	Specifies configuring SLPP.
guard	Specifies disabling a port as soon as an SLPP PDU is received.
ports	Specifies ports on which to configure the recovery timeout period.
port_list	Selects which ports to configure the recovery timeout period for (list separated by a comma or -).
all	Specifies configuring all ports with the designated recovery timeout period.
recovery-timeout	Specifies configuring the timeout period after which ports are re-enabled.
seconds	Designates the recovery timeout period in seconds after which the ports are re-enabled. Range is 10–65,535. Default is 60 seconds.
none	

Default

By default, the recovery timeout period is 60 seconds.

Usage Guidelines

SLPP is an application that detects loops in a Split Multi-link Trunking (SMLT) network. SLPP Guard is a complementary feature that helps prevent loops in networks by administratively disabling an edge port if a switch receives an SLPP PDU from an SMLT network.

On a port with SLPP Guard enabled, if an SLPP PDU is received, the port is immediately disabled. After the configured timeout value set by this command expires (associated with each port), the port is automatically re-enabled.

Example

The following example configures the recovery timeout period to 600 seconds for port 9:

```
# configure slpp guard ports 9 recovery-timeout 600
```

History

This command was available in ExtremeXOS 30.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp access-profile

```
configure snmp access-profile [ access_profile {readonly | readwrite} |
   [[add rule ] [first | [[before | after] previous_rule]]] | delete
   rule | none ]
```

Description

Configures *SNMP* to use an *ACL* policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
readonly	Specifies that access granted by the specified policy is read only.
readwrite	Specifies that access granted by the specified policy is read/write.
add	Specifies that an ACL rule is to be added to the SNMP application.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that the named rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

SNMP access is enabled by default, with no ACL policies.

Usage Guidelines

You must be logged in as administrator to configure SNMP parameters. You can restrict SNMP access in the following ways:

- Implement an ACL policy. You create an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for SNMP. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

In the ACL policy file for SNMP, the source-address field is the only supported match condition. Any other match conditions are ignored.

Use the none option to remove a previously configured ACL policy.

- Add an ACL rule to the SNMP application through this command. Once an ACL is associated with SNMP, all the packets that reach an SNMP module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly, regardless of whether the ACL is configured to add counters. To display counter statistics, use the `show access-list counters process` snmp command.

Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

Match conditions:

- Source-address—IPv4 and IPv6
- Actions:
  - Permit
  - Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the SNMP traffic does not match any of the rules, the default behavior is deny.

Creating an ACL Policy File

To create an ACL policy file, use the `edit policy` command. For more information about creating and implementing ACL policy files, see the *Policy Manager* and *ACLs* chapters in the *Switch Engine 32.2 User Guide*.

If you attempt to implement a policy that does not exist, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists. To confirm the existence of the policies, use the `ls` command. If the policy does not exist, create the ACL policy file.

Viewing SNMP Information

To display the current management configuration, including SNMP access related information, whether SNMP access is enabled or disabled, and whether any ACL or rules are configured for SNMP, use the following command: `show management`

Example

The following example applies the ACL policy file MyAccessProfile_2 to SNMP:

```
configure snmp access-profile MyAccessProfile_2
```

The following example applies the ACL rule DenyAccess to SNMP as the first rule in the list:

```
configure snmp access-profile add DenyAccess first
```

The following example deletes the ACL rule DenyAccess from the SNMP application:

```
configure snmp access-profile delete DenyAccess
```

To delete the use of all the ACL rules or a policy file by SNMP, use the following command:

```
configure snmp access-profile none
```

History

This command was first available in ExtremeXOS 11.6.

Support for individual ACL rules was added in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp add community

```
configure snmp add community [readonly | readwrite] alphanumeric_string
   [encrypted enc_community_name | community name | hex
   hex_community_name ] store-encrypted
```

Description

Adds a *SNMP* read or read/write community string.

Syntax Description

readonly	Specifies read-only access to the system.
readwrite	Specifies read and write access to the system.
encrypted	Community name is encrypted.
hex	Provide value in hexadecimal.
hex_community_name	Community name in hexadecimal.
store-encrypted	Community name will be stored as encrypted, instead plain text.
alphanumeric_string	Specifies an SNMP community string name. See “Usage Guidelines” for more information.

Default

N/A

Usage Guidelines

Community strings provide a simple method of authentication between a switch and a remote network manager. Read community strings provide read-only access to the switch. The default read-only community string is public. Read-write community strings provide read and write access to the switch. The default read/write community string is private. Sixteen read-only and sixteen read/write community strings can be configured on the switch, including the defaults.

An authorized trap receiver must be configured to use the correct community strings on the switch for the trap receiver to receive switch-generated traps. In some cases, it may be useful to allow multiple community strings so that all switches and trap receivers are not forced to use identical community strings. The `configure snmp add community` command allows you to add multiple community strings in addition to the default community string.

An SNMP community string can contain up to 32 characters.

We recommend that you delete the defaults of the community strings. To delete the value of the default read/write and read-only community strings, use the `configure snmp delete community` command.

Example

The following command adds a read/write community string with the value extreme:

```
configure snmp add community readonly hex 65:01
```

History

This command was first available in ExtremeXOS 10.1.

The **hex** keyword and *hex_community_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp add notification-log

```
configure snmp add notification-log [default | name | hex hex_name ]
   user [snmp_user_name | hex hex_snmp_user_name ] sec-model sec_model
   sec-level sec_level ]
```

Description

Adds a notification log.

Syntax Description

name	Specifies the name of the log.
hex	Provide value in hexadecimal.
hex_name	Name of the log in hexadecimal.
user	Name of the *SNMP* user on whose behalf the log should be created.
snmp_user_name	SNMP user name in ASCII..
hex_snmp_user_name	SNMP user name in hexadecimal.
sec-model	Security framework associated with the user.
sec_model	Security model.
sec-level	Authentication and privacy levels of the user.
sec_level	Security level.

Default

Disabled.

Usage Guidelines

Use this command to add a notification log. All entries in the log and its configuration are removed when this command is successfuly executed.

Example

The following example adds *nmslog1*:

```
configure snmp add notification log nmslog1 user admin sec-model usm sec-level priv
```

History

This command was first available in ExtremeXOS 15.5.

The **hex** keyword, *hex_name* variable, and *hex_snmp_user_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp add trapreceiver

```
configure snmp add trapreceiver [ip_address | ipv6_address] community
   [[hex hex_community_name] | community_name] {port port_number} {from
   [src_ip_address | src_ipv6_address]} {vr vr_name} {mode trap_mode}
```

Description

Adds the IP address of a trap receiver to the trap receiver list and specifies which SNMPv1/v2c traps are to be sent.

Syntax Description

ip_address	Specifies an *SNMP* trap receiver IPv4 address.
ipv6_address	Specifies an SNMP trap receiver IPv6 address
hex_community_name	Specifies that the trap receiver is to be supplied as a colon separated string of hex octets.
community_name	Specifies the community string of the trap receiver to be supplied in ASCII format.
port_number	Specifies a UDP port to which the trap should be sent. Default is 162.
src_ip_address	Specifies the IPv4 address of a *VLAN* to be used as the source address for the trap.
src_ipv6_address	Specifies the IPv6 address of a VLAN to be used as the source address for the trap.
vr_name	Specifies the name of the virtual router.
trap_mode	Specifies the mode of the traps:enhanced—Contains extra varbinds at the end.standard—Does not contain extra varbinds.

Default

Trap receivers are in enhanced mode by default, and the version is SNMPv2c by default.

Usage Guidelines

The IP address can be unicast, multicast, or broadcast.

An authorized trap receiver can be one or more network management stations on your network. Authorized trap receivers must be configured on the switch for the trap receiver to receive switch-generated traps. The switch sends SNMP traps to all trap receivers configured to receive the specific trap group.

To view the SNMP trap receivers configured on the switch, use the `show management` command. The `show management` command displays information about the switch including the destination and community of the SNMP trap receivers configured on the switch.

Example

The following command adds the IP address 10.101.0.100 as a trap receiver with community string purple:

```
configure snmp add trapreceiver 10.101.0.100 community purple
```

The following command adds the IP address 10.101.0.105 as a trap receiver with community string green, using port 3003:

```
configure snmp add trapreceiver 10.101.0.105 community green port 3003
```

The following command adds the IP address 10.101.0.105 as a trap receiver with community string blue, and IP address 10.101.0.25 as the source:

```
configure snmp add trapreceiver 10.101.0.105 community blue from 10.101.0.25
```

History

This command was first available in ExtremeXOS 10.1.

The virtual router parameter was added in ExtremeXOS 12.3.

IPv6 support was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp delete community

```
configure snmp delete community [readonly | readwrite] [all |
   community_name |alphanumeric_string | hex hex_community_name |
   encrypted enc_community_name ]
```

Description

Deletes a *SNMP* read or read/write community string.

Syntax Description

readonly	Specifies read-only access to the system.
readwrite	Specifies read and write access to the system.
all	Specifies all of the SNMP community stings.
alphanumeric_string	Specifies an SNMP community string name. See “Usage Guidelines” for more information.
hex	Provide value in hexadecimal.
hex_community_name	Community name in hexadecimal.

Default

The default read-only community string is public. The default read/write community string is private.

Usage Guidelines

You must have at least one community string for SNMP access. If you delete all of the community strings on your system, you will no longer have SNMP access, even if you have SNMP enabled.

The community strings allow a simple method of authentication between the switch and the remote network manager. There are two types of community strings on the switch. Read community strings provide read-only access to the switch. The default read-only community string is public. read/write community strings provide read and write access to the switch. The default read/write community string is private. Sixteen read-only and sixteen read-write community strings can be configured on the switch, including the defaults. The community string for all authorized trap receivers must be configured on the switch for the trap receiver to receive switch-generated traps. SNMP community strings can contain up to 32 characters.

For increased security, we recommend that you change the defaults of the read/write and read-only community strings.

Use the configure snmp add commands to configure an authorized SNMP management station.

Example

The following command deletes a read/write community string named extreme:

```
configure snmp delete community readonly hex 65:01
```

History

This command was first available in ExtremeXOS 10.1.

The **hex** keyword and *hex_community_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp delete notification-log

```
configure snmp delete notification-log [default | name | hex hex_name ]
```

Description

Deletes a notification log.

Syntax Description

default	The default log.
name	Specifies the name of the log.

hex	Provide value in hexadecimal.
hex_name	Name of the log in hexadecimal.

Default

Disabled.

Usage Guidelines

Use this command to delete a notification log. All entries in the log and its configuration are removed when this command is successfuly executed.

Example

The following example deletes *nmslog1*:

```
configure snmp delete notification-log hex 01:02
```

History

This command was first available in ExtremeXOS 15.5.

The **default** and **hex** keywords and *hex_name* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp delete trapreceiver

```
configure snmp delete trapreceiver [[ip_address | ipv6_address]
   {port_number} | all]
```

Description

Deletes a specified trap receiver or all authorized trap receivers.

Syntax Description

ip_address	Specifies an *SNMP* trap receiver IPv4 address.
ipv6_address	Specifies an SNMP trap receiver IPv6 address.
port_number	Specifies the port associated with the receiver.
all	Specifies all SNMP trap receiver IP addresses.

Default

The default port number is 162.

Usage Guidelines

Use this command to delete a trap receiver of the specified IPv4 or IPv6 address, or all authorized trap receivers.

This command deletes only the first SNMPv1/v2c trap receiver whose IP address and port number match the specified value.

Example

The following command deletes the trap receiver 10.101.0.100 from the trap receiver list:

```
configure snmp delete trapreceiver 10.101.0.100
```

The following command deletes entries in the trap receiver list for 10.101.0.100, port 9990:

```
configure snmp delete trapreceiver 10.101.0.100 9990
```

Any entries for this IP address with a different community string will not be affected.

History

This command was first available in ExtremeXOS 10.1.

IPv6 support was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp ifmibifalias size

```
config snmp ifmib ifalias size [default | extended ]
```

Description

Controls the accessible string size for the *SNMP* ifAlias object.

Syntax Description

default	Specifies read-only access to the system.
extended	Specifies read and write access to the system.

Default

N/A.

Usage Guidelines

Use this command to control the accessible string size for the SNMP ifAlias object.

If you choose the extended size option, the following warning will be displayed:

```
Warning: Changing the size to [extended] requires the use of increased
255 chars long ifAlias object of ifXtable from IF-MIB(RFC 2233)
```

You can always configure a 255 character long string regardless the configured value of ifAlias size. Its value only affects the SNMP behavior.

Example

The following example shows how to configure the accessible string size for the SNMP ifAlias to the default value:

```
config snmp ifmib ifalias size[default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp notification-log filter-profile-name

```
configure snmp notification-log [ default | name | hex
   hex_name ] [ filter-profile-name [ none | filter_profile_name
   | hex hex_filter_profile_name ] | entry-limit [system-managed |
   entry_limit ] ]
```

Description

Changes the configuration of a notification log.

Syntax Description

filter-profile-name	Sets the notification filter profile for this log (default: none).
none	Specifies the global entry limit.
filter_profile_name	Sets the notification filter profile for this log (default: none)
none	Specifies no notification filter profile.

filter_profile_name	Specifies the notification filter profile name.
hex	Provide value in hexadecimal.
hex_name	Name of the log in hexadecimal.
filter-profile-name	Set the notification filter profile for this log. Default = none.
hex_filter_profile_name	Notification filter profile name in hexadecimal.
entry-limit	Sets the maximum number of entries in this log (default: system-managed).
system-managed	Specifies that entries will be removed from this log when the global entry limit is exceeded.
entry_limit	Specifies that entries will be removed from this log when the specified limit is exceeded. The range is 1–16000.

Default

Usage Guidelines

Use this command to change the configuration of a notification log. Use the `configure snmpv3 add filter-profile` command to create notification filter profiles.

Example

The following example sets the filter for the default log to all and its maximum size to 1500:

```
configure snmp notification-log default filter-profile-name all entry-limit 1500
```

History

This command was first available in ExtremeXOS 15.5.

The **hex** keywords and *hex_name* and *hex_filter_profile_name* variables were added in ExtremeXOS 15.6

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp notification-log

```
configure snmp notification-log [global-entry-limit global_entry_limit |
   global-age-out [none | minutes]]
```

Description

Configures notification log settings that affect all logs.

Syntax Description

global-entry-limit	Sets the maximum number of entries in all logs combined (default: 16000)
global_entry_limit	Specifies the global entry limit. Range is 1-16000.
global-age-out	Sets the number of minutes a notification should be kept in a log before it is automatically removed (default: 1440 for one day).
none	Specifies that notifications are not aged out.
minutes	Specifies the global age out in minutes. The range is 1 - 4294967295.

Default

global-entry-limit is 16000.

global-age-out is 1440 for one day.

Usage Guidelines

Use this command to configure notification log settings that affect all logs.

Example

The following example sets the log size to 10000, and disable aging:

```
configure snmp notification-log global-entry-limit 10000 global-age-out none
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp sysContact

`configure snmp` **`syscontact`** *`sysContact`*

Description

Configures the name of the system contact.

Syntax Description

sysContact	An alphanumeric string that specifies a system contact name.

Default

N/A.

Usage Guidelines

The system contact is a text field that enables you to enter the name of the person(s) responsible for managing the switch. A maximum of 255 characters is allowed. The allowed character set is A-Z, a-z, 0-9, +-@_.,:;()/ ".

To view the name of the system contact listed on the switch, use the `show switch` command. The `show switch` command displays switch statistics including the name of the system contact.

Example

The following example defines FredJ as the system contact:

```
configure snmp syscontact FredJ
```

The following output from the `show switch` command displays FredJ as the system contact:

```
SysName:        engineeringlab
SysLocation:    englab
SysContact:     FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp sysLocation

`configure snmp` **`syslocation`** *`sysLocation`*

Description

Configures the location of the switch.

Syntax Description

`sysLocation`	An alphanumeric string that specifies the switch location.

Default

N/A.

Usage Guidelines

Use this command to indicate the location of the switch. A maximum of 255 characters is allowed. The allowed character set is A-Z, a-z, 0-9, +-@_.,:;()/ ".

To view the location of the switch on the switch, use the `show switch` command. The `show switch` command displays switch statistics including the location of the switch.

Example

The following example configures a switch location name on the system:

```
configure snmp syslocation englab
```

The following output from the `show switch` command displays englab as the location of the switch:

```
SysName:        engineeringlab
SysLocation:    englab
SysContact:     FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp sysName

`configure snmp` **`sysname`** *`sysName`*

Description

Configures the name of the switch.

Syntax Description

sysName	An alphanumeric string that specifies a device name.

Default

The default sysName is the model name of the device (for example, ExtremeSwitching X440-G2).

Usage Guidelines

You can use this command to change the name of the switch. A maximum of 255 characters is allowed. The allowed character set is A-Z, a-z, 0-9, +-@_.,:;()/ ".

The sysName appears in the switch prompt. On a SummitStack, the sysName appears in the prompt of all active nodes in the stack when there is a master node present in the stack.

To view the name of the system listed on the switch, use the `show switch` command. The `show switch` command displays switch statistics including the name of the system.

Example

The following example names the switch:

```
configure snmp sysname engineeringlab
```

The following output from the `show switch` command displays engineeringlab as the name of the switch:

```
SysName:          engineeringlab
SysLocation:      englab
SysContact:       FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Beginning in ExtremeXOS 15.7, the maximum number of characters has been changed to 255.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmp traps batch-delay bfd

```
configure snmp traps batch-delay bfd none | delay
```

Description

This command allows you to configure the time during which the set of affected sessions will be collected and a single trap will be set for contiguous session IDs. This means that there is a small delay between event occurrence and trap generation. You have the option to disable this optimization delay using the **none** option.

Syntax Description

snmp	Configure *SNMP* specific settings.
traps	Configure SNMP Trap generation settings.
batch-delay	Maximum delay before trap generation in order to combine multiple traps into a single trap.

none	Disables trap optimization which results in generation of one trap for status change of each session.
delay	Choose delay to balance between number of traps and delay in trap generation. Range is 50 to 65535 ms.

Default

1000 ms.

Usage Guidelines

Use this command to configure the time window during which the set of affected sessions is collected and single trap is set for contiguous sessions IDs.

Example

The following command configures the BFD batch-delay:

```
# configure snmp traps batch-delay bfd 1000
```

History

This command was first available in ExtremeXOS 15.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add access

```
configure snmpv3 add access [[hex hex_group_name] | group_name] {sec-
   model [snmpv1 | snmpv2c | usm]} {sec-level [noauth | authnopriv
   | priv]} {read-view [[hex hex_read_view_name] | read_view_name]}
   {write-view [[hex hex_write_view_name]] | write_view_name]} {notify-
   view [[hex hex_notify_view_nam]] | notify_view_name]} {volatile}
```

Description

Creates (and modifies) a group and its access rights.

Syntax Description

hex_group_name	Specifies the group name to add or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to add or modify. The value is to be supplied in ASCII format.
sec-model	Specifies the security model to use.

snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.
authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.
read-view	Specifies the read view name:hex_read_view_name—Specifies a hex value supplied as a colon separated string of hex octetsread_view_name—Specifies an ASCII value.
write-view	Specifies the write view name:hex_write_view_name—Specifies a hex value supplied as a colon separated string of hex octetswrite_view_name—Specifies an ASCII value.
notify-view	Specifies the notify view name:hex_notify_view_name—Specifies a hex value supplied as a colon separated string of hex octetsnotify_view_name—Specifies an ASCII value.
volatile	Specifies volatile storage.

Default

The default values are:

- sec-model—USM
- sec-level—noauth
- read view name—defaultUserView
- write view name— “”
- notify view name—defaultNotifyView
- non-volatile storage

Usage Guidelines

Use this command to configure access rights for a group. All access groups are created with a unique default context, “”, as that is the only supported context.

Use more than one character when creating unique community strings and access group names.

A number of default groups are already defined. These groups are: admin, initial, v1v2c_ro, v1v2c_rw.

- The default groups defined are v1v2c_ro for security name v1v2c_ro, v1v2c_rw for security name v1v2c_rw, admin for security name admin, and initial for security names initial, initialmd5, initialsha, initialmd5Priv and initialshaPriv.
- The default access defined are admin, initial, v1v2c_ro, v1v2c_rw, and v1v2cNotifyGroup.

Example

In the following command, access for the group defaultROGroup is created with all the default values: security model usm, security level noauth, read view defaultUserView, no write view, notify view defaultNotifyView, and storage nonvolatile.

```
configure snmpv3 add access defaultROGroup
```

In the following command, access for the group defaultROGroup is created with the values: security model USM, security level authnopriv, read view defaultAdminView, write view defaultAdminView, notify view defaultAdminView, and storage nonvolatile.

```
configure snmpv3 add access defaultROGroup sec-model usm sec-level authnopriv read-view
defaultAdminView write-view defaultAdminView notify-view defaultAdminView
```

History

This command was first available in ExtremeXOS 10.1.

The hex_read_view_name, hex_write_view_name, and hex_notify_view_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add community

```
configure snmpv3 add community [[hex hex_community_index] |
   community_index] [encrypted name community_name | name [[hex
   hex_community_name] | community_name] {store-encrypted} ] user
   [[hex hex_user_name] | user_name] {tag [[hex transport_tag] |
   transport_tag]} {volatile}
```

Description

Adds an SNMPv3 community entry.

Syntax Description

hex_community_index	Specifies the row index in the snmpCommunity table as a hex value supplied as a colon separated string of hex octets.
community_index	Specifies the row index in the snmpCommunity Table as an ASCII value.
hex_community_name	Specifies the community name as a hex value supplied as a colon separated string of hex octets.
community_name	Specifies the community name as an ASCII value.

hex_user_name	Specifies the USM user name as a hex value supplied as a colon separated string of hex octets.
user_name	Specifies the USM user name as an ASCII value.
tag	Specifies the tag used to locate transport endpoints in SnmpTargetAddrTable. When this community entry is used to authenticate v1/v2c messages, this tag is used to verify the authenticity of the remote entity.hex_transport_tag—Specifies a hex value supplied as a colon separated string of hex octetstransport_tag —Specifies an ASCII value
volatile	Specifies volatile storage.

Default

N/A.

Usage Guidelines

Use this command to create or modify an SMMPv3 community in the community MIB.

Example

```
switch # configure snmp add community readonly extreme store-encrypted
switch # show snmpv3 community
Community Index  : extreme
Community Name   : hys{fnj (encrypted)
Security Name    : v1v2c_ro
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:63
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
switch # configure snmp add community readwrite extreme123
switch # show snmpv3 community
Community Index  : extreme
Community Name   : hys{fnj (encrypted)
Security Name    : v1v2c_ro
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:63
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
Community Index  : extreme123
Community Name   : extreme123
Security Name    : v1v2c_rw

# Module snmpMaster configuration.
#
configure snmpv3 add community extreme encrypted name hys{fnj user v1v2c_ro
configure snmpv3 add community extreme123 name extreme123 user v1v2c_rw
The following command creates an entry with the community index comm_index, community
```

```
name comm_public, and user (security) name v1v2c_user:
configure snmpv3 add community comm_index name comm_public user v1v2c_user
```

History

This command was first available in ExtremeXOS. 10.1.

The hex_community_index, hex_community_name, hex_user_name, and hex_transport_tag parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add filter

```
configure snmpv3 add filter [[hex hex_profile_name] | profile_name]
   subtree object_identifier {/subtree_mask} type [included | excluded]
   {volatile}
```

Description

Adds a filter to a filter profile.

Syntax Description

hex_profile_name	Specifies the filter profile that the current filter is added to. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile that the current filter is added to in ASCII format.
object identifier	Specifies a MIB subtree.
subtree_mask	Specifies a hex octet string used to mask the subtree. For example, f7a indicates 1.1.1.1.0.1.1.1.1.0.1.0.
included	Specifies that the MIB subtree defined by object identifier/mask is to be included.
excluded	Specifies that the MIB subtree defined by object identifier/mask is to be excluded.
volatile	Specifies volatile storage.

Default

The default values are:

- mask value—empty string (all 1s).
- type—included.
- storage—non-volatile.

Usage Guidelines

Use this command to create a filter entry in the snmpNotifyFilterTable. Each filter includes or excludes a portion of the MIB. Multiple filter entries comprise a filter profile that can eventually be associated with a target address. Other commands are used to associate a filter profile with a parameter name, and the parameter name with a target address.

This command can be used multiple times to configure the exact filter profile desired.

Example

The following command adds a filter to the filter profile prof1 that includes the MIB subtree 1.3.6.1.4.1/f0:

```
configure snmpv3 add filter prof1 subtree 1.3.6.1.4.1/f0 type included
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add filter-profile

```
configure snmpv3 add filter-profile [[hex hex_profile_name] |
   profile_name] param [[hex hex_param_name]] | param_name] {volatile}
```

Description

Associates a filter profile with a parameter name.

Syntax Description

hex_profile_name	Specifies the filter profile name. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile name in ASCII format.
hex_param_name	Specifies a parameter name to associate with the filter profile. The value to follow is to be supplies as a colon separated string of hex octets.
param_name	Specifies a parameter name to associate with the filter profile in ASCII format.
volatile	Specifies volatile storage.

Default

The default storage type is non-volatile.

Usage Guidelines

Use this command to add an entry to the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. The parameter name is associated with target addresses, and the filter profile is associated with a series of filters, so, in effect, you are associating a series of filters with a target address.

Example

The following command associates the filter profile prof1 with the parameter name P1:

```
configure snmpv3 add filter-profile prof1 param P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add group user

```
configure snmpv3 add group [[hex hex_group_name] | group_name] user
   [[hex hex_user_name] | user_name] {sec-model [snmpv1| snmpv2c | usm]}
   {volatile}
```

Description

Adds a user name (security name) to a group.

Syntax Description

hex_group_name	Specifies the group name to add or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to add or modify in ASCII format.
hex_user_name	Specifies the user name to add or modify. The value to follow is to be supplies as a colon separated string of hex octets.
user_name	Specifies the user name to add or modify in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.

snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
volatile	Specifies volatile storage.

Default

The default values are:

- sec-model—USM.
- non-volatile storage.

Usage Guidelines

Use this command to associate a user name with a group.

As per the SNMPv3 RFC, a security name is model independent while a username is model dependent. For simplicity, both are assumed to be same here. User names and security names are handled the same. In other words, if a user is created with the user name username, the security name value is the same, username.

Every group is uniquely identified by a security name and security model. So the same security name can be associated to a group name but with different security models.

Example

The following command associates the user userV1 to the group defaultRoGroup with SNMPv1 security:

```
configure snmpv3 add group defaultRoGroup user userV1 sec-model snmpv1
```

The following command associates the user userv3 with security model USM and storage type volatile to the access group defaultRoGroup:

```
configure snmpv3 add group defaultRoGroup user userV3 volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name and hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add mib-view

```
configure snmpv3 add mib-view [[hex hex_view_name] | view_name]
   subtree object_identifier {subtree_mask} {type [included | excluded]}
   {volatile}
```

Description

Adds (and modifies) a MIB view.

Syntax Description

hex_view_name	Specifies the MIB view name to add or modify. The value is to be supplies as a colon separated string of hex octets.
view_name	Specifies the MIB view name to add or modify in ASCII format.
object_identifier	Specifies a MIB subtree.
subtree_mask	Specifies a hex octet string used to mask the subtree. For example, f7a indicates 1.1.1.1.0.1.1.1.1.0.1.0.
included	Specifies that the MIB subtree defined by subtree/mask is to be included.
excluded	Specifies that the MIB subtree defined by subtree/mask is to be excluded.
volatile	Specifies volatile storage.

Default

The default mask value is an empty string (all 1s). The other default values are included and non-volatile.

Usage Guidelines

Use this command to create a MIB view into a subtree of the MIB. If the view already exists, this command modifies the view to additionally include or exclude the specified subtree.

In addition to the created MIB views, there are three default views. They are: defaultUserView, defaultAdminView, and defaultNotifyView.

Example

The following command creates the MIB view allMIB with the subtree 1.3 included as non-volatile:

```
configure snmpv3 add mib-view allMIB subtree 1.3
```

The following command creates the view extremeMib with the subtree 1.3.6.1.4.1.1916 included as non-volatile:

```
configure snmpv3 add mib-view extremeMib subtree 1.3.6.1.4.1.1916
```

The following command creates a view vrrpTrapNewMaster which excludes *VRRP* notification .1 and the entry is volatile:

```
configure snmpv3 add mib-view vrrpTrapNewMaster 1.3.6.1.2.1.68.0.1/ff8 type excluded
volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_view_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add notify

```
configure snmpv3 add notify [[hex hex_notify_name] | notify_name] tag
   [[hex hex_tag] | tag] {type [trap | inform]}{volatile}
```

Description

Adds an entry to the snmpNotifyTable.

Syntax Description

hex_notify_name	Specifies the notify name to add. The value is to be supplied as a colon separated string of hex octets.
notify_name	Specifies the notify name to add in ASCII format.
hex_tag	Specifies a string identifier for the notifications to be sent to the target. The value is supplied as a colon separated string of octets.
tag	Specifies a string identifier for the notifications to be sent to the target in ASCII format.
trap	Specifies an unconfirmed notification.
inform	Specifies a confirmed notification.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default storage type is non-volatile.

The default type is trap.

Usage Guidelines

Use this command to add an entry to the snmpNotifyTable. When a notification is to be sent, this table is examined. For the target addresses that have been associated with the tags present in the table, notifications are sent based on the filters also associated with the target addresses.

Example

The following command sends notifications to addresses associated with the tag type1:

```
configure snmpv3 add notify N1 tag type1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_notify_name and hex_tag parameters were added in ExtremeXOS 11.0.

The INFORM option was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add target-addr

```
configure snmpv3 add target-addr [[hex hex_addr_name] | addr_name]
   param [[hex hex_param_name] |param_name ] ipaddress [ ip_address
   | ipv4-with-mask ip_and_tmask ] | [ ipv6_address | ipv6-with-mask
   ipv6_and_tmask ]] {transport-port port_number} {from [src_ip_address
   | src_ipv6_address]} {vr vr_name} {tag-list [tag_list | hex
   hex_tag_list]} {volatile}
```

Description

Adds and configures an SNMPv3 target address and associates filtering, security, and notifications with that address.

Syntax Description

hex_addr_name	Specifies a string identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address in ASCII format.
hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.
ip_address	Specifies an SNMPv3 target IPv4 address.

ipv4-with-mask	Specify IPv4 address with hexadecimal mask.
ip_and_tmask	Specifies the IPv4 address and hexadecimal mask in form A.B.C.D/NN...
ipv6_address	Specifies an SNMPv3 target IPv6 address.
ipv6-with-mask	Specify IPv6 address with hexadecimal mask.
ipv6_and_tmask	Specifies an IPv6 address and hexadecimal mask in form A:B:C:D:E:F:G:H/NN...
port_number	Specifies a UDP port. Default is 162.
src_ip_address	Specifies the IPv4 address of a *VLAN* to be used as the source address for the trap.
src_ipv6_address	Specifies the IPv6 address of a VLAN to be used as the source address for the trap.
vr_name	Specifies the name of the virtual router.
tag-list	Specifies a list of comma separated string identifiers for the notifications to be sent to the target.
hex_tag_list	Tag list in RFC 3413 format (in hexadecimal).
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- transport-port—port 162.
- non-volatile storage.

If you do not specify tag-list the single tag defaultNotify, a pre-defined value in the snmpNotifyTable is used.

Usage Guidelines

Use this command to create an entry in the SNMPv3 snmpTargetAddressTable. The **param** parameter associates the target address with an entry in the snmpTargetParamsTable, which specifies security and storage parameters for messages to the target address, and an entry in the snmpNotifyFilterProfileTable, which specifies filter profiles to use for notifications to the target address. The filter profiles are associated with the filters in the snmpNotifyFilterTable.

The list of tag-lists must match one or more of the tags in the snmpNotifyTable for the trap to be sent out.

Example

The following command specifies a target address of 10.203.0.22 with the name A1, and associates it with the security parameters and target address parameter P1:

```
configure snmpv3 add target-addr A1 param P1 ipaddress 10.203.0.22
```

The following command specifies a target address of 10.203.0.22 with the name A1, and associates it with the security parameters and target address parameter P1, and the notification tags type1 and type2:

```
configure snmpv3 add target-addr A1 param P1 ipaddress 10.203.0.22 from 10.203.0.23 tag-
list type1,type2
```

History

This command was first available in ExtremeXOS 10.1.

The virtual router, IP address and hexadecimal mask parameters were added in ExtremeXOS 12.3.

IPv6 support was added in ExtremeXOS 12.4.

The **IPv4-with-mask** and **IPv6-with-mask** keywords were added in ExtremeXOS 15.3.2.

The **hex** keyword and *hex_tag_list* variable were added in ExtremeXOS 15.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add target-params

```
configure snmpv3 add target-params [[hex hex_param_name] |
   param_name ]user [[hex hex_user_name] | user_name] mp-model [snmpv1
   |snmpv2c | snmpv3] sec-model [snmpv1 | snmpv2c | usm] {sec-level
   [noauth | authnopriv | priv]} {volatile}
```

Description

Adds and configures SNMPv3 target parameters.

Syntax Description

hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.
hex_user_name	Specifies a user name. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies a user name in ASCII format.
mp-model	Specifies a message processing model; choose from SNMPv1, SNMPv2, or SNMPv3.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.

snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.
authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- sec-level—noauth.
- non-volatile storage.

Usage Guidelines

Use this command to create an entry in the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

To associate a target address with a parameter name, see the command `configure snmpv3 add target-addr`.

Example

The following command specifies a target parameters entry named P1, a user name of guest, message processing and security model of SNMPv2c, and a security level of no authentication:

```
configure snmpv3 add target-params P1 user guest mp-model snmpv2c sec-model snmpv2c sec-level noauth
```

History

This command was first available in ExtremeXOS 10.1.

The hex_param_name and hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add user

```
configure snmpv3 add user [ hex hex_user_name | user_name ]
   {engine-id engine_id} {authentication [md5 | sha] {localized-key
   auth_localized_key | hex hex_auth_password | auth_password} {privacy
   {des |3des |aes {128 |192 | 256}} {localized-key priv_localized_key |
   hex hex_priv_password | priv_password} }} {volatile}
```

Description

Adds (and modifies) an SNMPv3 user.

Syntax Description

hex_user_name	Specifies the user name to add or modify. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to add or modify in ASCII format.
engine-id	*SNMP* engine id. If not specified, the user is created with the local engine id.
engine_id	Engine id (in hexadecimal)"; type="ostring_t
authentication	Specifies the authentication password or hex string to use for generating the authentication key for this user.
md5	Specifies RSA Data Security, Inc. *MD5* Message-Digest Algorithm authentication.
sha	Specifies SHA authentication.
localized-key	Following value is a MD5 or SHA digest of the engine-id and user's password.
auth_localized_key	Authentication localized key (in hexadecimal)) ;type="ostring_t"
privacy	Specifies the privacy password or hex string to use for generating the privacy key for this user.
des	Specifies the use of the 56-bit DES algorithm for encryption. This is the default.
3des	Specifies the use of the 168-bit 3DES algorithm for encryption.
aes	Specifies the use of the AES algorithm for encryption.
128	Specifies the use of the 128-bit AES algorithm for encryption.
192	Specifies the use of the 192-bit AES algorithm for encryption.
256	Specifies the use of the 256-bit AES algorithm for encryption.
priv_localized_key	Privacy localized key (in hexadecimal)"; type="ostring_t"
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- authentication—no authentication.
- privacy—no privacy.
- non-volatile storage.

Usage Guidelines

Use this command to create or modify an SNMPv3 user configuration.

The default user names are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv. The initial password for admin is password. For the other default users, the initial password is the user name.

If hex is specified, supply a 16 octet hex string for RSA Data Security, Inc. MD5 Message-Digest Algorithm, or a 20 octet hex string for SHA.

You must specify authentication if you want to specify privacy. There is no support for privacy without authentication.

Note

3DES, AES 192, and AES 256 bit encryptions are proprietary implementations and may not work with some SNMP managers.

SNMPv3 password and localized-key are saved to the configuration file using AES256-CBC encryption.

Example

The following command configures the user guest on the local SNMP Engine with security level noauth (no authentication and no privacy):

```
configure snmpv3 add user guest
```

The following command configures the user authMD5 to use RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication with the password palertyu:

```
configure snmpv3 add user authMD5 authentication md5  palertyu
```

The following command configures the user authShapriv to use SHA authentication with the hex key shown below, the privacy password palertyu, and volatile storage:

```
configure snmpv3 add user authShapriv authentication sha hex
01:03:04:05:01:05:02:ff:ef:cd:12:99:34:23:ed:ad:ff:ea:cb:11 privacy palertyu volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Support for 3DES and AES was added in ExtremeXOS 12.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 add user clone-from

```
configure snmpv3 add user [[hex hex_user_name] | user_name] {engine-
   id engine_id}clone-from [[hex hex_user_name] | user_name] {engine-id
   clone_from_engine_id}
```

Description

Creates a new user by cloning from an existing SNMPv3 user.

Syntax Description

hex_user_name	Specifies the user name to add or to clone from. The value is to be supplies as a colon separated string of hex octets.
user_name	Specifies the user name to add or to clone from in ASCII format.
engine-id	*SNMP* engine ID
engine_id	Engine ID of the user to be added in hexadecimal format. Default: local engine ID)"; type="ostring_t
clone_from_engine_id	Engine ID of the user to be cloned in hexadecimal (Default: local engine ID)"; type="ostring_t

Default

N/A.

Usage Guidelines

Use this command to create a new user by cloning an existing one. After you have successfully cloned the new user, you can modify its parameters using the following command:

```
configure snmpv3 add user [[hex hex_user_name] |user_name]
{authentication [md5 | sha] [hexhex_auth_password |auth_password]}
{privacy {des | 3des | aes {128 | 192 | 256}} [[hexhex_priv_password]
| priv_password]} }{volatile}
```

Users cloned from the default users will have the storage type of non-volatile. The default names are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command creates a user cloneMD5 with same properties as the default user initalmd5. All authorization and privacy keys will initially be the same as with the default user initialmd5.

```
configure snmpv3 add user cloneMD5 clone-from initialmd5
```

The following command adds a remote user named nmsuser2 belonging to the SNMP engine with engine-id 11:22:33 by cloning another remote user named nmsuser1 belonging to the SNMP engine with engine id AA:BB::CC:

```
conf snmpv3 add user nmsuser2 engine-id 11:22:33 clone-from nmsuser1 engine-id AA:BB:CC
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete access

```
configure snmpv3 delete access [all-non-defaults | {[[hex
   hex_group_name] | group_name] {sec-model [snmpv1 | snmpv2c | usm]
   sec-level [noauth | authnopriv | priv]}}]
```

Description

Deletes access rights for a group.

Syntax Description

all-non-defaults	Specifies that all non-default (non-permanent) security groups are to be deleted.
hex_group_name	Specifies the group name to be deleted. The value is to be supplies as a colon separated string of hex octets.
group_name	Specifies the group name to be deleted in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.

authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.

Default

The default values are:

- sec-model—USM.
- sec-level—noauth.

Usage Guidelines

Use this command to remove access rights for a group. Use the all-non-defaults keyword to delete all the security groups, except for the default groups. The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

Deleting an access will not implicitly remove the related group to user association from the VACMSecurityToGroupTable. To remove the association, use the following command:

```
configure snmpv3 delete group {[[hex hex_group_name] |group_name]} user
[all-non-defaults | {[[hexhex_user_name] |user_name] {sec-model [snmpv1|
snmpv2c|usm]}}]
```

Example

The following command deletes all entries with the group name userGroup:

```
configure snmpv3 delete access userGroup
```

The following command deletes the group userGroup with the security model snmpv1 and security level of authentication and no privacy (authnopriv):

```
configure snmpv3 delete access userGroup sec-model snmpv1 sec-level authnopriv
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete community

```
configure snmpv3 delete community [all | {[[hex hex_community_index] |
   community_index} | {name [[hex hex_community_name] | community_name}]
```

Description

Deletes an SNMPv3 community entry.

Syntax Description

all	Specifies that all community entries are to be removed.
hex_community_index	Specifies the row index in the snmpCommunityTable. The value is to be supplied as a colon separated string of hex octets.
community_index	Specifies the row index in the snmpCommunityTable in ASCII format.
hex_community_name	Specifies the community name. The value is to be supplied as a colon separated string of hex octets.
community_name	Specifies the community name in ASCII format.

Default

The default entries are public and private.

Usage Guidelines

Use this command to delete an SMMPv3 community in the community MIB.

Example

The following command deletes an entry with the community index comm_index:

```
configure snmpv3 delete community comm_index
```

The following command creates an entry with the community name (hex) of EA:12:CD:CF:AB:11:3C:

```
configure snmpv3 delete community name hex EA:12:CD:CF:AB:11:3C
```

History

This command was first available in ExtremeXOS 10.1.

The hex_community_index and hex_community_name parameters were added in ExtremeXOS 11.0.

The **all-non-defaults** keyword was replaced with the **all** keyword in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete filter

```
configure snmpv3 delete filter [all | [[hex hex_profile_name] |
   profile_name] {subtree object_identifier}]]
```

Description

Deletes a filter from a filter profile.

Syntax Description

all	Specifies all filters.
hex_profile_name	Specifies the filter profile of the filter to delete. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile of the filter to delete in ASCII format.
object_identifier	Specifies the MIB subtree of the filter to delete.

Default

N/A.

Usage Guidelines

Use this command to delete a filter entry from the snmpNotifyFilterTable. Specify all to remove all entries. Specify a profile name to delete all entries for that profile name. Specify a profile name and a subtree to delete just those entries for that filter profile and subtree.

Example

The following command deletes the filters from the filter profile prof1 that reference the MIB subtree 1.3.6.1.4.1:

```
configure snmpv3 delete filter prof1 subtree 1.3.6.1.4.1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete filter-profile

```
configure snmpv3 delete filter-profile [all |[hex hex_profile_name |
   profile_name] {param [hex hex_param_name | param_name}]]
```

Description

Removes the association of a filter profile with a parameter name.

Syntax Description

all	Specifies all filter profiles.
hex_profile_name	Specifies the filter profile name to delete. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile name to delete in ASCII format.
hex_param_name	Specifies to delete the filter profile with the specified profile name and parameter name. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies to delete the filter profile with the specified profile name and parameter name in ASCII format.

Default

The default storage type is non-volatile.

Usage Guidelines

Use this command to delete entries from the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. Specify all to remove all entries. Specify a profile name to delete all entries for that profile name. Specify a profile name and a parameter name to delete just those entries for that filter profile and parameter name.

Example

The following example deletes the filter profile prof1 with the parameter name P1:

```
configure snmpv3 delete filter-profile prof1 param P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete group user

```
configure snmpv3 delete group {[[hex hex_group_name] | group_name]} user
   [all-non-defaults | {[[hex hex_user_name] | user_name] {sec-model
   [snmpv1|snmpv2c|usm]}}]
```

Description

Deletes a user name (security name) from a group.

Syntax Description

hex_group_name	Specifies the group name to delete or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to delete or modify in ASCII format.
all-non-defaults	Specifies that all non-default (non-permanent) users are to be deleted from the group.
hex_user_name	Specifies the user name to delete or modify. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to delete or modify in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).

Default

The default value for sec-model is USM.

Usage Guidelines

Use this command to remove the associate of a user name with a group.

As per the SNMPv3 RFC, a security name is model independent while a username is model dependent. For simplicity, both are assumed to be same here. User names and security names are handled the same. In other words, if a user is created with the user name username, the security name value is the same, username.

Every group is uniquely identified by a security name and security model. So the same security name can be associated to a group name but with different security models.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

The default users are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command deletes the user guest from the group UserGroup for the security model snmpv2c:

```
configure snmpv3 delete group UserGroup user guest sec-model snmpv2c
```

The following command deletes the user guest from the group userGroup with the security model USM:

```
configure snmpv3 delete group userGroup user guest
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name and the hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete mib-view

```
configure snmpv3 delete mib-view [all-non-defaults | {[[hex
   hex_view_name] | view_name] {subtree object_identifier}}]
```

Description

Deletes a MIB view.

Syntax Description

all-non-defaults	Specifies that all non-default (non-permanent) MIB views are to be deleted.
hex_view_name	Specifies the MIB view to delete. The value is to be supplied as a colon separated string of hex octets.
view_name	Specifies the MIB view name to delete in ASCII format.
object_identifier	Specifies a MIB subtree.

Default

N/A.

Usage Guidelines

Use this command to delete a MIB view. Views which are being used by security groups cannot be deleted. Use the all-non-defaults keyword to delete all the MIB views (not being used by security

groups) except for the default views. The default views are: defaultUserView, defaultAdminView, and defaultNotifyView.

Use the `configure snmpv3 add mib-view` command to remove a MIB view from its security group, by specifying a different view.

Example

The following command deletes all views (only the permanent views will not be deleted):

```
configure snmpv3 delete mib-view all-non-defaults
```

The following command deletes all subtrees with the view name AdminView:

```
configure snmpv3 delete mib-view AdminView
```

The following command deletes the view AdminView with subtree 1.3.6.1.2.1.2

```
configure snmpv3 delete  mib-view AdminView subtree 1.3.6.1.2.1.2
```

History

This command was first available in ExtremeXOS 10.1.

The hex_view_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete notify

```
configure snmpv3 delete notify [{[[hex hex_notify_name] | notify_name]}
   | all-non-defaults]
```

Description

Deletes an entry from the snmpNotifyTable.

Syntax Description

hex_notify_name	Specifies the notify name to add. The value is to be supplied as a colon separated string of hex octets.
notify_name	Specifies the notify name to add in ASCII format.
all-non-defaults	Specifies that all non-default (non-permanent) notifications are to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete an entry from the snmpNotifyTable. When a notification is to be sent, this table is examined. For the target addresses that have been associated with the tags present in the table, notifications will be sent, based on the filters also associated with the target addresses.

Example

The following command removes the N1 entry from the table:

```
configure snmpv3 delete notify N1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_notify_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete target-addr

```
configure snmpv3 delete target-addr [{[[hex hex_addr_name] | addr_name]}
   | all]
```

Description

Deletes SNMPv3 target addresses.

Syntax Description

hex_addr_name	Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address.
all	Specifies all target addresses.

Default

N/A.

Usage Guidelines

Use this command to delete an entry in the SNMPv3 snmpTargetAddressTable.

Example

The following command deletes target address named A1:

```
configure snmpv3 delete target-addr A1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_addr_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete target-params

```
configure snmpv3 delete target-params [{[[hex hex_param_name] |
   param_name]} | all]
```

Description

Deletes SNMPv3 target parameters.

Syntax Description

hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to delete an entry in the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

Example

The following command deletes a target parameters entry named P1:

```
configure snmpv3 delete target-params P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_param_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 delete user

```
configure snmpv3 delete user [all | [[hex hex_user_name] | user_name]
   {engine-id engine_id}]
```

Description

Deletes an existing SNMPv3 user.

Syntax Description

all	Specifies that all users are to be deleted.
hex_user_name	Specifies the user name to delete. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to delete.
engine-id	*SNMP* engine ID
engine-id	Engine ID in hexadecimal (Default: local engine ID)"; type="ostring_t

Default

N/A.

Usage Guidelines

Use this command to delete an existing user.

Deleting users does not implicitly remove the related group-to-user association from the VACMSecurityToGroupTable. To remove the association, use the following command:

```
configure snmpv3 delete group {[[hex hex_group_name] | group_name]}
user [all-non-defaults | {[[hex hex_user_name] | user_name] {sec-model
[snmpv1|snmpv2c|usm]}}]
```

Example

The following command deletes all users:

```
configure snmpv3 delete user all
```

The following command deletes the user "guest":

```
configure snmpv3 delete user guest
```

The following command deletes a remote user named "ambiguoususer" with engine id 11:22:33:

```
configure snmpv3 delete user ambiguoususer engine-id 11:22:33
```

History

This command was first available in ExtremeXOS 10.1.

The **hex_user_name** parameter was added in ExtremeXOS 11.0.

The **engine_id** keyword was added in ExtremeXOS 15.4.

The **all-non-default** keyword was replaced with the **all** keyword in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 engine-boots

`configure snmpv3 engine-boots` *(1-2147483647)*

Description

Configures the SNMPv3 Engine Boots value.

Syntax Description

(1-2147483647)	Specifies the value of engine boots.

Default

N/A.

Usage Guidelines

Use this command if the Engine Boots value needs to be explicitly configured. Engine Boots and Engine Time will be reset to one (1) if the Engine ID is changed. Engine Boots can be set to any desired value, but will latch on its maximum, 2147483647.

Example

The following command configures Engine Boots to 4096:

```
configure snmpv3 engine-boots 4096
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 engine-id

```
configure snmpv3 engine-id hex_engine_id
```

Decription

Configures the SNMPv3 snmpEngineID.

Syntax Description

hex_engine_id	Specifies the colon delimited hex octet that serves as part of the snmpEngineID (5-32 octets).

Default

The default snmpEngineID is the device MAC address.

Usage Guidelines

Use this command if the snmpEngineID needs to be explicitly configured. The first four octets of the ID are fixed to 80:00:07:7C,which represents Extreme Networks Vendor ID. Once the snmpEngineID is changed, default users are reverted back to their original passwords/keys, while non-default users are removed from the device.

Example

The following command configures the snmpEngineID to be 80:00:07:7C:00:0a:1c:3e:11:

```
configure snmpv3 engine-id 00:0a:1c:3e:11
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 target-addr retry

```
configure snmpv3 target-addr [[hex hex_addr_name] | addr_name] retry
   retry_count
```

Description

Configures SNMPv3 INFORM notification retries.

Syntax Description

hex_addr_name	Specifies a address name in hexadecimal format.
addr_name	Specifies the address name in ASCII format.
retry_count	Specifies the maximum number of times to resend an SNMPv3 inform.

Default

The retry default is 3.

Usage Guidelines

Use this command to configure the number of times an SNMPv3 INFORM message is to be resent to the (notification responder) manager when a response has not been received.

Example

The following command configures a retry count of 5 for the target address A1:

```
configure snmpv3 target-addr A1 retry 5
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure snmpv3 target-addr timeout

```
configure snmpv3 target-addr [[hex hex_addr_name] | addr_name] timeout
   timeout_val
```

Description

Configures the SNMPv3 INFORM notification timeout.

Syntax Description

hex_addr_name	Specifies the address name in hexadecimal format.
addr_name	Specifies the address name in ASCII format.
timeout_val	Specifies the number of seconds.

Default

The timeout value default is 15 seconds.

Usage Guidelines

Use this command to configure how many seconds to wait for a response before resending an SNMPv3 INFORM.

Example

The following command configures a timeout value of 20 seconds for the target address A1:

```
configure snmpv3 target-addr A1 timeout 20
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sntp-client

`configure sntp-client [`**`primary`**` | `**`secondary`**`] `*`host-name-or-ip`*` {`**`vr`**` `*`vr_name`*`}`

Description

Configures an NTP server for the switch to obtain time information.

Syntax Description

primary	Specifies a primary server name.
secondary	Specifies a secondary server name.
host-name-or-ip	Specifies a host name or IPv4 address or IPv6 address.

vr	Specifies use of a virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the *Switch Engine 32.2 Feature License Requirements* document.
vr_name	Specifies the name of a virtual router.

Default

N/A.

Usage Guidelines

Queries are first sent to the primary server. If the primary server does not respond within 1 second, or if it is not synchronized, the switch queries the second server. If the switch cannot obtain the time, it restarts the query process. Otherwise, the switch waits for the sntp-client update interval before querying again.

Example

The following example configures a primary NTP server:

```
configure sntp-client primary 10.1.2.2
```

The following example configures the primary NTP server to use the management virtual router *VR-Mgmt*:

```
configure sntp-client primary 10.1.2.2 vr VR-Mgmt
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vr_name* option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5420, 5520, 5720 series switches.

configure sntp-client update-interval

```
configure sntp-client update-interval update-interval
```

Description

Configures the interval between polls for time information from *SNTP* servers.

Syntax Description

update-interval	Specifies an interval in seconds.

Default

64 seconds.

Usage Guidelines

None.

Example

The following command configures the interval timer:

```
configure sntp-client update-interval 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 access-profile

```
configure ssh2 access-profile [ access_profile | [[add rule] [first |
   [[before | after] previous_rule]]] | delete rule | none]
```

Description

Configures SSH2 to use an *ACL* policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
add	Specifies that an ACL rule is to be added to the SSH2 port.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

N/A.

Usage Guidelines

You must be logged in as administrator to configure SSH2 parameters.

- Implement an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for the SSH2 port. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

  In the ACL policy file for SSH2, the “source-address” field is the only supported match condition. Any other match conditions are ignored.

  Use the none option to remove a previously configured ACL.

  Policy files can also be configured using the `enable ssh2` command.
- Add an ACL rule to the SSH2 application through this command. Once an ACL is associated with SSH2, all the packets that reach an SSH2 module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the `show access-list counters process` command.

  Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

  Match conditions:
  - Source-address—IPv4 and IPv6
  - Actions—Permit or Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the SSH2 traffic does not match any of the rules, the default behavior is deny. To permit SSH2 traffic that does not match any of the rules, add a permit all rule at the end of the rule list.

Creating an ACL Policy File

To create an ACL policy file, use the `edit policy` command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs in the *Switch Engine 32.2 User Guide*.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the `ls` command. If the policy does not exist, create the ACL policy file.

Example

The following example applies the ACL MyAccessProfile_2 to SSH2:

```
configure ssh2 access-profile MyAccessProfile_2
```

The following example copies the ACL rule, DenyAccess to the SSH2 application in first place:

```
 configure ssh2 access-profile add DenyAccess first
```

The following example removes the association of a single rule from the SSH2 application:

```
configure ssh2 access-profile delete DenyAccess
```

The following example removes the association of all ACL policies and rules from the SSH2 application:

```
configure ssh2 access-profile none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 dh-group

```
configure ssh2 dh-group minimum [1 | 14 | 16 | 18]
```

Description

Configures the minimal supported Diffie-Hellman group.

Syntax Description

dh-group	Configures the Diffie-Hellman group. Used for cryptographic key exchange. Higher groups are stronger.
minimum	Configures minimal supported Diffie-Hellman group to avoid using weaker groups.
1	Supports Diffie-Hellman group 1 (1,024 bit), 14 (2,048 bit), 16 (4,096 bit), and 18 (8,192 bit).
14	Supports group 14 (2,048 bit), 16 (4,096 bit), and 18 (8,192 bit). Default.
16	Supports Diffie-Hellman group 16 (4,096 bits) and 18 (8,192 bits).
18	Supports only Diffie-Hellman group 18 (8,192 bits).

Default

The minimal supported Diffie-Hellman group is 14. This means that Diffie-Hellman groups 14, 16, and 18 are supported by default.

Usage Guidelines

Openssh-7.5p1 supports Diffie-Hellman group 1, 14, 16, and 18 as part of the key exchange algorithms. By default, Diffie-Hellman group 14, 16, and 18 are supported.

To revert back to using Diffie-Hellman group 1 (in addition to Diffie-Hellman group 14, 16, and 18), set the minimal support group to Diffie-Hellman group1.

The server picks the first entry from the client proposal and matches it with its own proposal. If there is no match, the server picks the next entry from the client proposal and so on. If no match is found, the connection is rejected.

Example

The following example configures Diffie-Hellman group 16 as the minimum supported Diffie-Hellman group.

```
configure ssh2 dh-group minimum 16
```

History

This command was first available in ExtremeXOS 22.1.

Support for Diffie-Hellman groups 16 and 18 was added in ExtremeXOS 22.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 disable cipher mac

```
configure ssh2 disable [cipher [cipher |all] |mac [ mac |all]]
```

Description

Disables ciphers/Message Authentication Codes (MACs) for use with SSHv2.

Syntax Description

cipher	Specifies cipher to disable for the encrypting session.
cipher	Specific cipher name to disable.
all	Specifies all ciphers/MACs available in current mode.
mac	Specifies MACs to disable for the encrypting session.
mac	Specific MAC name to disable.

Default

None.

Example

The following example disables cipher "aes256-ctr":

```
configure ssh2 disable cipher "aes256-ctr"
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 disable pk-alg

```
configure ssh2 disable {pk-alg [pkalg_name | all]}
```

Description

Disables DSA/RSA X509v3 public key algorithms.

Syntax Description

pk-alg	Specifies disabling DSA/RSA X509v3 public key algorithms.
pkalg_name	Specifies which algorithm to disable: "ssh-dss" "ssh-rsa" "x509v3-sign-dss" "x509v3-sign-rsa"
all	Specifies disabling all public key algorithms available.

Default

By default all the algorithms are enabled.

Example

The following example disables the ssh-dss algorithm:

```
configure ssh2 disable pk-alg ssh-dss
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 enable cipher mac

```
configure ssh2 enable [cipher [cipher |all] |mac [ mac |all]]
```

Description

Configures the required ciphers/Message Authentication Codes (MACs) with SSHv2.

Syntax Description

cipher	Specifies cipher to use for encrypting the session.
cipher	Cipher name for encrypting session.
all	Specifies all ciphers/MACs available in current mode.
mac	Specifies MACs to use for encrypting the session.
mac	MAC name for encrypting session.

Default

In Default mode, the following ciphers/MACs are *disabled* by default:

- Ciphers: 3des-cbc, aes128-cbc, aes192-cbc, aes256-cbc, rijndael-cbc@lysator.liu.se
- MACs: hmac-md5, hmac-md5-96, hmac-md5-etm@openssh.com, hmac-md5-96-etm@openssh.com, hmac-sha1-96, hmac-sha1-96-etm@openssh.com

In Default mode, the following ciphers/MACs are *enabled* by default:

- Ciphers: aes128-ctr, aes192-ctr, aes256-ctr, chacha20-poly1305@openssh.com
- MACs: hmac-sha1-etm@openssh.com, hmac-sha2-256-etm@openssh.com, hmac-sha2-512-etm@openssh.com, hmac-sha1, hmac-sha2-256, hmac-sha2-512.

Note
The following ciphers and MAC are no longer supported: arcfour, arcfour128, arcfour256, blowfish-cbc, cast128-cbc, hmac-ripemd160.

Example

The following example enables cipher "aes256-ctr" for the encrypting the session:

```
# configure ssh2 enable cipher "aes256-ctr"
```

History

This command was first available in ExtremeXOS 22.1.

Unsupported ciphers/macs removed due to SSH2 upgrade in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 enable pk-alg

```
configure ssh2 enable {pk-alg [pkalg_name | all]}
```

Description

Enables DSA/RSA X509v3 public key algorithms.

Syntax Description

pk-alg	Specifies enabling DSA/RSA X509v3 public key algorithms.
pkalg_name	Specifies which algorithm to enable: "ssh-dss" "ssh-rsa" "x509v3-sign-dss" "x509v3-sign-rsa"
all	Specifies enabling all public key algorithms available.

Default

ssh-dss is *disabled* by default.

ssh-rsa, x509v3-sign-rsa, x509v3-sign-dss are *enabled* by default.

Usage Guidelines

This public key algorithm configuration is used for the user key only—not for the host key. For a user key, ssh-dss algorithm is supported, but disabled by default. However, for host key, ssh-dss algorithm is not supported for both server and client. For backward compatibility it is supported in the server only during a switch image upgrade if this algorithm is present in earlier release.

Example

The following example enables the ssh-dss algorithm:

```
configure ssh2 enables pk-alg ssh-dss
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 idletimeout

```
configure ssh2 idletimeout [none | minutes]
```

Description

This command configures idle-timeout for SSH/SFTP connections.

Syntax Description

none	Idle timeout disabled.
minutes	Timeout value in minutes. Range is 1 to 240.

Default

60 minutes.

Usage Guidelines

If you enable the idle timer using the enable idletimeout command, the SSH2 connection times out after 20 minutes of inactivity by default. If you disable the idle timer using the disable idletimeout command, the SSH2 connection times out after 60 minutes of inactivity by default. This timeout value can be modified using the command “configure ssh2 idletimeout <minutes> wherein <minutes> can be from 1 to 240 ”. This ssh idle timer is applicable for SFTP connections as well.

Example

Configured ssh idle timeout is displayed in “show management” output:

```
# show management
CLI idle timeout                  : Enabled (2 minutes)
CLI max number of login attempts :        3
CLI max number of sessions       :        8
CLI paging                        : Enabled (this session only)
CLI space-completion              : Disabled (this session only)
CLI configuration logging         : Disabled
CLI journal size                  : 100
CLI password prompting only       : Disabled
CLI scripting                     : Disabled (this session only)
CLI scripting error mode          : Ignore-Error (this session only)

```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 key

```
configure ssh2 key {pregenerated}
```

Description

Generates the Secure Shell 2 (SSH2) host key. This command is used to regenerate a host key, if there is already one existing.

Syntax Description

pregenerated	indicates that the SSH2 host key is already available with the user.

Default

The switch generates a key for each SSH2 session.

Usage Guidelines

Secure Shell 2 (SSH2) is a feature of ExtremeXOS that allows you to encrypt session data between a network administrator using SSH2 client software and the switch or to send encrypted data from the switch to an SSH2 client on a remote system. Configuration, policy, image, and public key files may also be transferred to the switch using the Secure Copy Program (SCP2).

To enable SSH2, use the `enable ssh2` command.

A host key must be generated before the switch can accept incoming ssh connections. This can be done by the switch using the commands "enable ssh2" (if ssh is not enabled previously) or "configure ssh2 key pregenerated" (if you wish to use a pregenerated key as the host key).

If you elect to have the key generated, the key generation process can take up to one minute, and cannot be canceled after it has started. For the switch to use the newly generated key the exsshd process needs to be restarted using the command `restart process [class` *cname* `|` *name* `{msm` *slot*`}]` with "exsshd" as the *name*.

To use a key that has been previously created, use the **pregenerated** keyword. Use the `show ssh2 private-key` command to list and copy the previously generated key. Then use the `configure ssh2 key {pregenerated}` command where "pregenerated" represents the key that you paste.

Note

In ExtremeXOS 22.5 and later, ssh-dss (DSA) host key is not supported in both server and client. For backward compatibility, it is supported in server only during a switch image upgrade if this algorithm is present in earlier release.

The key generation process generates the SSH2 private host key. The SSH2 public host key is derived from the private host key, and is automatically transmitted to the SSH2 client at the beginning of an SSH2 session.

To view the status of SSH2 on the switch, use the `show management` command. The `show management` command displays information about the switch including the enable/disable state for SSH2 sessions, whether a valid key is present, and the TCP port and virtual router that is being used.

Example

The following command generates an authentication key for the SSH2 session:

```
configure ssh2 key
```

The command responds with the following messages:

```
WARNING: Generating new server host key This will take approximately 10
minutes and cannot be canceled. Continue? (y/n)
```

If you respond yes, the command begins the process.

To configure an SSH2 session using a previously generated key, use the following command:

```
configure ssh2 key pregenerated <pre-generated key>
```

Enter the previously-generated key (you can copy and paste it from the saved configuration file; a part of the key pattern is similar to 2d:2d:2d:2d:20:42:45:47:).

History

This command was first available in the ExtremeXOS 11.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 login-grace-timeout

`configure` **`ssh2 login-grace-timeout`** *seconds*

Description

For the SSH server, configures a timeout period for a login attempt.

Syntax Description

ssh2	Designates changing SSHv2 configuration.
login-grace-timeout	Designates having the SSHv2 server disconnects after this time if the user has not completed login attempt.
seconds	Sets the time in seconds for the disconnect timeout period. The default is 120 seconds, and the range is 60–120 seconds.

Default

By default, the timeout period is 120 seconds.

Usage Guidelines

To view the current timeout period setting , use the command `show ssh2`.

Example

The following example sets the timeout period ot 100 seconds:

```
# configure ssh2 login-grace-timeout 100
```

History

This command was first available in ExtremeXOS 30.7.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 rekey

```
configure ssh2 rekey [time-interval [time_interval |none] |data-limit
   [data_size |default]]
```

Description

Sets SSHv2 session rekeying interval by specifying a time interval value and/or amount of transferred data.

Syntax Description

ssh2	Specifies setting SSHv2 behavior.
rekey	Specifies rekey request interval for SSH connection.
time-interval	Sets rekey time interval.
time_interval	Specifies rekey time interval value in minutes. Valid range 1 to 1,440.
none	Specifies no time limit for rekey interval (default).
data-limit	Specifies rekey interval in terms of amount of data transferred.
data_size	Sets data transfer limit in MB. Valid range is 1 to 4,096 MB.
default	Sets the data limit to the default specified by the cipher. Values range between 1GB and 4GB. This is the default setting.

Default

If nothing is specified, the rekey time interval is set to none, and the data limit is specified by the cipher in use.

Usage Guidelines

You can set both a time limit and a data limit for the rekey interval. Your selections for rekeying appear in the output of the `show ssh2` command.

Example

The following example sets the SSHv2 rekey time interval to one hour (60 mins):

```
configure ssh2 rekey time-interval 60
```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssh2 secure-mode

```
configure ssh2 secure-mode [on | off]
```

Description

This command (secure-mode on) disables the weak ciphers and macs in SSH server and client.

Syntax Description

on	Enable all supported algorithms.
off	Enable only compliance algorithms.

Default

Off.

Usage Guidelines

After enabling secure-mode:

- For communication, SSH server uses a new secure-mode list made each for ciphers and macs.
- For SSH client, EPM is notified to change the bit dedicated to SSH secure-mode, which hides the weak ciphers and macs from SSH client CLI commands.

Example

```
configure ssh2 secure-mode on

show management
CLI idle timeout                  : Disabled
CLI max number of login attempts  : 3
CLI max number of sessions        : 8

```

History

This command was first available in ExtremeXOS 21.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 ocsp

```
configure ssh2 x509v3 ocsp [on | off]
```

Description

Enables or disables Online Certificate Status Protocol (OCSP) check for SSH2 x509v3 authentication.

Syntax Description

x509v3	Specifies x509v3 certificate-based authentication.
ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
on	Enables OCSP (default).
off	Disables OCSP.

Default

By default, OCSP is enabled.

Usage Guidelines

While you can disable OCSP, it is not recommended because no certificate revocation status check is performed.

Example

The following example enables OCSP check for SSH2 x509v3 servers.

```
# configure ssh2 x509v3 ocsp on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 ocsp nonce

```
configure ssh2 x509v3 ocsp nonce [on | off]
```

Description

Enables or disables the Online Certificate Status Protocol (OCSP) nonce for SSH2 x509v3 authentication.

Syntax Description

x509v3	Specifies x509v3 certificate-based authentication.
ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
nonce	Specifies to cryptographically bind an OCSP request and an OCSP response with the extension `id-pkix-ocsp-nonce` to prevent replay attacks.
on	Specifies to include the `id-pkix-ocsp-nonce` extension in the OCSP request and response.
off	Specifies to exclude the extension (default).

Default

Off.

Usage Guidelines

Example

The following example configures nonce:

```
# configure ssh2 x509v3 ocsp nonce on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 ocsp override

```
configure ssh2 x509v3 ocsp override [url | none]
```

Description

This command configures one HTTP Online Certificate Status Protocol (OCSP) override URL for an SSH2 x509v3 authentication.

Syntax Description

x509v3	Specifies x509v3 certificate-based authentication.
ocsp	Specifies the OCSP attribute.
override	Specifies to override the OCSP server in the AuthorityInformationAccess section of a syslog server's certificate.
url	Specifies the URL of the OCSP override server. Default port is 80.
none	Specifies to remove the OCSP override URL configuration (default).

Default

None.

Usage Guidelines

Only HTTP is supported with either FQDN or IP.

Example

The following example configures an override URL of `http://sshocsp:2023`:

```
# configure ssh2 x509v3 ocsp override http://sshocsp:2023
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW!

configure ssh2 x509v3 ocsp signer

`configure ssh2` **`x509v3 ocsp signer ocsp-nocheck`** `[`**`on`** `|` **`off`**`]`

Description

Enables or disables Online Certificate Status Protocol (OCSP) signer's ocsp-nocheck for SSH2 x509v3 authentication.

Syntax Description

x509v3	Specifies x509v3 certificate-based authentication.
ocsp	Specifies configuring OCSP for real-time certificate revocation status checking.
ocsp-nocheck	Specifies the extension `id-pkix-ocsp-nocheck`. If present in the OCSP signer's certificate, then it is trusted for its lifetime.
on	Specifies to override the `id-pkix-ocsp-nocheck` extension in the OCSP signer's certificate and forces the extension as if it is present.
off	Specifies to behave per the extension's presence in the OCSP signer's certificate. If not present and the OCSP signer is not root CA, then the whole OCSP will fail (default).
signer	Specifies the OCSP signer that signs the OCSP response.

Default

Off.

Usage Guidelines

Example

The following example enables OCSP signer's ocsp-nocheck for a SSH2 x509v3 server.

```
# configure ssh2 x509v3 ocsp signer ocsp-nocheck on
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 radius-password-auth

`configure ssh2` **`x509v3 radius-password-auth`** `[`**`on`** | **`off`**`]`

Description

Enables or disables password authentication using RADIUS for SSH2 x509v3 publication-key authentication.

Syntax Description

x509v3	Specifies x509v3 public-key authentication.
radius-password-auth	Specifies to obtain the password from the user and authenticate it using RADIUS server for X509v3 public-key authentication.
on	Specifies to enable password authentication using RADIUS for X509v3 public-key authentication.
off	Specifies to disable password authentication using RADIUS for X509v3 public-key authentication. (Default).

Default

Off.

Usage Guidelines

Example

The following example enables password authentication using RADIUS for X509v3 public-key authentication.

```
# configure ssh2 x509v3 radius-password-auth on
Note: When turned on, user provides password for RADIUS authentication.

If RADIUS is not configured, local authentication is used.
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 username overwrite

`configure ssh2` **`x509v3 username overwrite`** `[`**`on`** `|` **`off`**`]`

Description

Enables or disables authentication username configuration to use the Principal Name in the certificate as the username.

Syntax Description

x509v3	Specifies x509v3 public-key authentication.
username	Specifies X509v3 authentication username configuration.

overwrite	Specifies that when **radius-password-auth** is turned on, to use the Principal Name in the certificate as the username.
on	Specifies to enable X509v3 authentication username configuration.
off	Specifies to disable X509v3 authentication username configuration. (Default).

Default

Off.

Usage Guidelines

Example

The following example enable using the Principal Name in the certificate as the username.

```
# configure ssh2 x509v3 username overwrite on

Note: This command is applicable only if X509v3 'radius-password-auth' command is turned
on.
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 username strip-domain

`configure ssh2` **`x509v3 username strip-domain`** `[`**`on`** `|` **`off`**`]`

Description

Enables or disables authentication username configuration to strip the domain name for SSH2 x509v3 publication-key authentication.

Syntax Description

x509v3	Specifies x509v3 public-key authentication.
username	Specifies X509v3 authentication username configuration.
strip-domain	Specifies that when **radius-password-auth** and username **overwrite** are turned on, to strip the domain name from the username.

on	Specifies to enable X509v3 authentication username configuration.
off	Specifies to disable X509v3 authentication username configuration. (Default).

Default

Off.

Usage Guidelines

Example

The following example enables X509v3 authentication username configuration to strip the domain name from the username:

```
# configure ssh2 x509v3 username strip-domain on

Note: This command is applicable only if X509v3 'radius-password-auth' and username
'overwrite' commands are turned on.
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

NEW! configure ssh2 x509v3 username use-domain

`configure ssh2` **`x509v3 username use-domain`** [*domain_name* | **`none`**]

Description

Enables or disables authentication username configuration with a domain name using RADIUS for SSH2 x509v3 publication-key authentication.

Syntax Description

x509v3	Specifies x509v3 public-key authentication.
username	Specifies X509v3 authentication username configuration.
use-domain	Specifies that when **radius-password-auth**, username **overwrite**, and **strip-domain** are turned on, to use the configured domain name as the username.
domain_name	Specifies the domain name to be added to the username.
none	Specifies to remove the **use-domain** configuration. (Default).

Default

None.

Usage Guidelines

Example

The following example enable authentication username configuration with a domain name of 'abcdef.com':

```
# configure ssh2 x509v3 username use-domain abcdef.com

Note: This command is applicable only if X509v3 'radius-password-auth', username
'overwrite' and 'strip-domain' commands are turned on.
```

History

This command was first available in ExtremeXOS 32.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sshd2 user-key add user

`configure sshd2 user-key` *`key_name`* **`add user`** *`user_name`*

Description

Associates a user to a key.

Syntax Description

`key_name`	Specifies the name of the public key.
`user_name`	Specifies the name of the user.

Default

N/A.

Usage Guidelines

This command associates (or binds) a user to a key. Pressing **TAB** at the end of the command lists existing account names.

Example

The following example binds the key id_dsa_2048 to user admin:

```
configure sshd2 user-key id_dsa_2048 add user admin
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure sshd2 user-key delete user

```
configure sshd2 user-key key_name delete user user_name
```

Description

Disassociates a user to a key.

Syntax Description

key_name	Specifies the name of the public key.
user_name	Specifies the name of the user.

Default

N/A.

Usage Guidelines

This command disassociates (or unbinds) a user to a key. Pressing **TAB** at the end of the command shows a list of users attached to the key.

Example

The following example unbinds the key id_dsa_2048 from user admin:

```
configure sshd2 user-key id_dsa_2048 delete user admin
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssl certificate hash-algorithm

```
configure ssl certificate hash-algorithm hash_algorithm
```

Description

This command configures the hash algorithm.

Syntax Description

ssl	SSL.
certificate	Certificate.
hash-algorithm	Hash algorithm to use (Default SHA-512).
hash_algorithm	Name of hash algorithm to use (Default SHA-512).

Default

SHA-512 algorithm.

Usage Guidelines

Use this command to configure the hash algorithm. Once configured, this configured algorithm will be used for the next certificate creation. Previously *MD5* was the only hashing algorithm available. As of ExtremeXOS 16.1, the default has been changed to more secure SHA-512 algorithm. If you prefer the older version, you can configure to the least secure MD5 hashing algorithm.

Example

The following example displays the show ssl output with the SHA-512 algorithm configured:

```
X460G2-48t-10G4.5 # show ssl
HTTPS Port Number: 443 (Enabled)
Signature Algorithm configured: SHA-512 with RSA Encryption
Private Key matches the Certificate's public key.
RSA Key Length: 1024
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 0 (0x0)
    Signature Algorithm: md5WithRSAEncryption
        Issuer: C=IN, O=ext, CN=ext
        Validity
            Not Before: Dec  7 21:52:53 2014 GMT
            Not After : Dec  7 21:52:53 2015 GMT
        Subject: C=IN, O=ext, CN=ext
```

History

This command was first available in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssl certificate pregenerated

```
configure ssl certificate pregenerated{ {csr-cert}pregenerated {ocsp {on
    | off}}}
```

Description

Obtains the pre-generated certificate from the user.

Syntax Description

ssl	SSL.
certificate	Certificate.
csr-cert	Specifies the SSL/TLS certificate signed through CSR generated by switch. Trust chain verification performed during configuration. Only use this option for CSR-signed certificates.
pregenerated	Specifies already having a certificate or private key in Privacy Enhanced Mail (PEM) format.
ocsp	Specifies Online Certificate Status Protocol (OCSP). This option is only available if you have selected CSR-signed certificates.
on	Enables OCSP for SSL/TLS certificate signed through CSR generated by the switch.
off	Disables OCSP for SSL/TLS certificate signed through CSR generated by the switch (default).

Default

For CSR-signed certificates, OCSP is off by default.

Usage Guidelines

You must upload or generate a certificate for SSL server use. With this command, you copy and paste the certificate into the command line followed by a blank line to end the command. The following security algorithms are supported:

- RSA for public key cryptography (generation of certificate and public-private key pair, certificate signing). RSA key size between 2,048 and 4,096 bits.
- Symmetric ciphers (for data encryption): RC4, DES, and 3DES.
- Message Authentication Code (MAC) algorithms: RSA Data Security, Inc. *MD5* Message-Digest Algorithm and SHA.

This command is also used when downloading or uploading the configuration. Do not modify the certificate stored in the uploaded configuration file because the certificate is signed using the issuer's private key.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Only use the **csr-cert** option for CSR-signed certificates.

When a certificate is imported using this **csr-cert** option, mandatory trust chain verification and optional revocation check is performed. For a successful import, both verifications should pass. ExtremeXOS supports the revocation checking using the OCSP library. During the import of the switch certificate, if it is with **csr-cert** option, then if the trust chain verification passes, then the revocation status of the switch certificate and a maximum of 5 intermediate CA certificates (total of 6 certificates). When OCSP on is chosen, a revocation check is performed. The certificate is accepted only when revocation status is good for all certificates (switch and a maximum of 5 intermediate CA). If the revocation status is anything other than good (including unable to connect, no response, revoked, unknown) for any of the above certificates, then that certificate import is rejected. It can be imported though, by selecting OCSP as off.

Example

The following command obtains the pre-generated certificate from the user:

```
configure ssl certificate pregenerated
```

Next, you open the certificate, and then copy and paste the certificate into the console/Telnet session, followed by a blank line to end the command.

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

As of ExtremeXOS 21.1, the SSH XMOD is part of the base image and not available as a separate XMOD module.

Ability to configure CSR-signed certificates was added in ExtremeXOS 31.2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssl certificate privkeylen

```
configure ssl certificate privkeylen length country code organization
   org_name common-name name
```

Description

Creates a self-signed certificate and private key that can be saved in the EEPROM.

Syntax Description

length	Specifies the private key length in bytes. Valid values are between 2,048 and 4,096.
code	Specifies the country code in 2-character form.
org_name	Specifies the organization name. The organization name can be up to 64 characters long.
name	Specifies the common name. The common name can be up to 64 characters long.

Default

N/A.

Usage Guidelines

This command creates a self signed certificate and private key that can be saved in the EEPROM. The certificate generated is in the PEM format.

Any existing certificate and private key is overwritten.

The size of the certificate depends on the RSA key length (privkeylen) and the length of the other parameters (country, organization name, and so forth) supplied by the user. For an RSA key length of 4,096, the certificate length is approximately 2 Kb, and the private key length is approximately 3 Kb.

Example

The following example creates an SSL certificate in the USA for a website called bigcats:

```
configure ssl certificate privkeylen 2048 country US organization IEEE common-name bigcats
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssl csr

configure **ssl csr privkeylen** *length* **country** *code* **organization** *org_name* **common-name** *name*

Description

Generates certificate signing request (CSR) and private key.

Syntax Description

ssl	Specifies SSL (Secure Sockets Layer).
csr	Specifies creating a CSR (certificate signing request).
privkeylen	Specifies setting the private key length.
length	Specifies the value for the private key length in bytes (2,048–4,096).
country	Specifies setting the country code.
code	Specifies the two-character value for the country code.
organization	Specifies setting the organization name.
org_name	Specifies the value for the organization name (maximum of 64 characters).
common-name	Specifies setting the common name.
name	Specifies setting the value for the common name (maximum of 60 characters).

Default

N/A.

Usage Guidelines

Note
There can only be one CSR per switch.

After entering values for the private key length, country code, organization, and common name, you are prompted to enter information for the Distinguished Name (DN): state, locality, organization unit, and email address.

Note
Due to changes in the Distinguished Name (DN), you are prompted to provide country, organization, and common name to ensure backward compatibility.

Example

The following example creates a CSR with a private key length of 2,048, country is USA, organization is "EXTR", and the common name is "test":

```
# configure ssl csr privkeylen 2048 country US organization EXTR common-name test
You are about to be asked to enter information that will be incorporated into your
certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
For some fields there will be a default value in [].
If you enter '.' the field will be left blank.
-----
State or Province Name (full name) []: North Carolina
Locality Name (eg, city) [Default City]: Raleigh
Organizational Unit Name (eg, section) []: RDU
Email Address []: jsmith@extremenetworks.com
```

```

```

History

This command was first available in ExtremeXOS 22.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure ssl privkey pregenerated

```
configure ssl privkey pregenerated
```

Description

Obtains the pre-generated private key from the user.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command is also used when downloading or uploading the configuration. The private key is stored in the EEPROM, and the certificate is stored in the configuration file.

With this command, you copy and paste the private key into the command line followed by a blank line to end the command. The following security algorithms are supported:

- RSA for public key cryptography (generation of certificate and public-private key pair, certificate signing). RSA key size between 1024 and 4096 bits.
- Symmetric ciphers (for data encryption): RC4, DES, and 3DES.
- Message Authentication Code (MAC) algorithms: RSA Data Security, Inc. *MD5* Message-Digest Algorithm and SHA.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Example

The following command obtains the pre-generated private key from the user:

```
configure ssl privkey pregenerated
```

Next, you the open the certificate and then copy and paste the certificate into the console/Telnet session, followed by **[Enter]** to end the command.

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stack-ports debounce time

```
configure stack-ports {port-list} debounce time [default | time]
```

Description

Configures debounce time feature on stacking ports.

Syntax Description

port-list	Specifies one or more stacking ports.
default	Configure the default value.
milliseconds	Time in milliseconds. Range is 0 (no debouncing) to 5000.

Default

Default debounce time value is 0.

Usage Guidelines

Debounce timer can be configured to override the false link flaps i.e. link flaps that happens in a milliseconds interval.

Example

```
configure stack-ports 1:1 1:2 debounce time 150
```

History

This command was first available in ExtremeXOS 15.3.4.

Platform Availability

The command is available on all stackable switches.

configure stacking alternate-ip-address

```
configure stacking alternate-ip-address [ipaddress netmask | ipNetmask]
   gateway automatic configure stacking [node-address node-address
   | slot slot_number] alternate-ip-address [ipaddress netmask |
   ipNetmask] gateway
```

Description

Configures an alternate management IP address, subnetwork, and gateway.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command. A node address or slot number is required unless the automatic keyword is specified.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the `show stacking` command.
ipaddress netmask	Specifies the unique address that exists on the Management *VLAN* subnet as configured on the initial master node together with the subnetwork mask specified for the Management subnetwork. Example: 66.77.88.1 255.255.255.0.

ipNetmask	Specifies the unique address that exists on the Management VLAN subnet as configured on the initial master node, followed by a slash (/) character, followed by a decimal number that represents the number of leading one bits in the subnetwork address. An example is 66.77.88.1/24.
gateway	The address of an IP router. A default route is set up to reach this gateway.

Default

No alternate IP address is configured.

Usage Guidelines

If a Management subnetwork is configured and the alternate IP subnetwork does not exactly match the configured Management subnetwork, the information configured by one of the commands specified above is not used. The previously configured alternate IP address is removed if it was installed and subsequently a Management subnetwork is configured that does not exactly match the alternate IP subnetwork. In either case, an error message is logged. The alternate IP address is used if there is no configured Management subnetwork.

To use the command with the node address, the node must be in the stack topology; and to use the command with the slot number, the node must be in the active topology. This form of the command operates only on one node at a time. There are no checks to verify that the address is the one configured in the management VLAN subnet.

The command that does not require a node address or slot number specifies the automatic keyword. Usage of this form of the command causes an alternate IP address to be assigned to every node in the stack topology. The first address is the address specified in the `[ipaddress netmask | ipNetmask]` parameter. The next address is the IP address plus one, and so on. Since there is a specified subnet mask, the address is checked to insure that the block of IP addresses fits within the specified subnet given the number of nodes in the stack topology. The range of addresses is tested to insure that each one is a valid IP unicast address. If the test fails, no node is configured and an error message is printed. Assignment is in the order in which nodes would currently appear in the `show stacking` display.

The configuration takes effect after the command is successfully executed.

The alternate IP address, subnetwork, and gateway are only used when the node is operating in stacking mode.

Example

To configure an alternate IP address for every node in the stack with a single command:

```
configure stacking alternate-ip-address 10.120.1.10/24 10.120.1.1 automatic
```

To configure an alternate IP address on a single node in the stack topology:

```
configure stacking node-address 00:04:96:26:6b:ed alternate-ip-address 10.120.1.1/24
10.120.1.1
```

You may configure an alternate IP address using a slot number for a node that is currently occupying the related slot:

```
configure stacking slot 4 alternate-ip-address 10.120.1.13/24 10.120.1.1
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking easy-setup

```
configure stacking easy-setup
```

Description

This command provides an easy way to initially configure the stacking parameters of all nodes in a new stack.

Syntax Description

This command does not have additional syntax.

Default

N/A.

Usage Guidelines

This command performs the following functions:

- Informs you of the stacking parameters that will be set.
- Informs you of the number of nodes that will be configured.
- Informs you whether minimal or no redundancy will be configured, and which slot will contain the master node.
- Informs you of the slot number that will be assigned to the node on which your management session is being run.
- If applicable, warns you that the current configuration file changes will be lost and you need to save the files.
- If the stack topology is a daisy chain, warns you that you should wire the stack as a ring before running this command.

- Requires you to confirm before the operation takes place. If you proceed, the command does the following:
  - Enables stacking on all nodes.
  - Configures the stacking MAC address using the factory address of the current node.
  - Configures a slot number for each node.
  - Configures redundancy to minimal in a ring topology or none in a daisy chain topology.
  - Configures the stacking protocol.
  - Reboots the stack topology.
- Selects the enhanced stacking protocol.

Stacking is enabled as if the `enable stacking {node-address node-address}` command was issued.

The stack mac-address is configured as if the `configure stacking mac-address` was issued on the current node.

Stack slot numbers are assigned as if the `configure stacking slot-number automatic` command was issued on the current node.

On a daisy chain topology, the master-capability is configured as if the configure stacking redundancy none command was issued. On a ring topology, the master-capability is configured as if the configure stacking redundancy minimal command was issued.

If you choose not to proceed with the setup, the following message is displayed:

```
Cancelled easy stack setup configuration.
```

Example

If you have an 8-node stack in a ring topology and have powered on all the nodes, the `show stacking` command shows the stack topology as a ring with all intended nodes present. If you have not changed any ExtremeXOS configuration, the command displays as follows:

```
* Switch.30 # configure stacking easy-setup
For every node in the 8-node stack, this command will:
- enable stacking
- configure a stack MAC address
- choose and configure a slot number (this node will be assigned to slot 1)
- configure redundancy to minimal (slot 1 will be the Master node)
Upon completion, the stack will automatically be rebooted into the new configuration.
Warning: If stacking is already configured, this command will alter that configuration.
Warning: There are unsaved configuration changes. You may wish to save them before
proceeding.
Do you wish to proceed? (y/N) y
Stacking configuration is complete. Rebooting...
```

If the 8-node stack topology is a daisy chain, and the user is logged into a node in the middle of the chain, the command output might appear as follows:

```
* Switch.30 # configure stacking easy-setup
For every node in the 8-node stack, this command will:
- enable stacking
- configure a stack MAC address
```

```
- choose and configure a slot number (this node will be assigned to slot 5)
- configure redundancy to none (slot 1 will be the master node)
Upon completion, the stack will automatically be rebooted into the new configuration.
Warning: If stacking is already configured, this command will alter that configuration.
Warning: This stack is a daisy chain.  It is highly recommended that the stack
be connected as a ring before running this command.
Do you wish to proceed? (y/N) Yes
Stacking configuration is complete.  Rebooting...
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking license-level

```
configure stacking {node-address node-address | slot slot-number}
   license-level license_restriction
```

Description

Allows you to restrict the license level at which the node operates.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.
slot-number	Specifies the slot number of the target node. To view the slot numbers, enter the `show stacking` command.
license_restriction	Specifies the restricted license level: • For ExtremeSwitching 5420 and 5520 series switches, the choices are Base or Premier.

Default

No license level restriction is configured.

Usage Guidelines

This command causes a node to operate at a lower license level than the level that was purchased for the node.

Running this command does not change the installed license level. For example, if a stackable is configured with the Advanced Edge license and you configure a license level restriction of Edge, the unit is restricted to features available in the Edge license. However, you can remove the restriction and operate at the Advanced Edge level.

If the installed license level of the target node is lower than the level you are attempting to configure, the following message appears:

```
Warning: Switch will not operate at a license level beyond that which
was purchased.
```

If the node-address or slot parameter is not specified, the command takes effect on every node in the stack topology.

This command takes effect after you restart the node. The following message appears after the command is executed:

```
This command will take effect at the next reboot of the specified
node(s).
```

If you restart the node without configuring a license level restriction, the node operates at the purchased license level. To see the purchased license level of a node, run `show licenses` after logging in to the node.

The `show licenses` command displays the current license level in use as the Effective License Level:

```
Slot-2 Stack.1 # show licenses
Enabled License Level:
Advanced Edge
Enabled Feature Packs:
None
Effective License Level:
Edge
```

The `show stacking configuration` and `show stacking {node-address` *`node-address`* `| slot`*`slot-number`*`} detail` commands allow you to see the configured license level restriction and the restriction currently in use.

The Effective License Level appears only when stacking is enabled. The command is node-specific. The effective license level is the level at which the node is restricted to operate, and is not necessarily the level at which the entire stack is operating. This is because it is possible to have the restriction differ on each node, in which case one or more nodes may have failed because of the differing levels.

Example

To configure the stacking level Edge on all nodes in a stack:

```
# configure stacking license-level edge
```

To configure stacking level Edge for a node:

```
# configure stacking node-address 00:04:96:26:6b:ed license-level edge
```

To configure the stacking level Advanced Edge for an active node that currently occupies slot 4:

```
# configure stacking slot 4 license-level advanced-edge
```

History

This command was first available in ExtremeXOS 12.0.

The *license_restriction* variable was added, and the options **Edge**, **Advanced Edge**, and **Core** were removed in ExtremeXOS 31.1.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking mac-address

```
configure stacking {node-address node-address | slot slot-number} mac-
   address
```

Description

Selects a node in the stack whose factory assigned MAC address is to be used to form the stack MAC address.

The formed address is then configured on every node in the stack topology.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.
slot-number	Specifies the slot number of an active node whose factory MAC address is to be used to form the stack MAC address. To view the slot numbers, enter the `show stacking` command.

Default

No stack MAC selection is configured.

Usage Guidelines

You must select a node whose factory assigned MAC address can be used to form a MAC address that represents the stack as a whole. The system forms the stack MAC address by setting the Universal / Local bit in the specified MAC address. This means that the stack MAC address is a locally administered address, and not the universal MAC address assigned to the selected node.

If you do not specify any node, the stack MAC address is formed from the factory assigned MAC address of the node from which you are running the command.

This command takes effect only after you restart the node. The following message appears after you run the command:

```
This command will take effect at the next reboot of the specified
node(s).
```

If a stack node that has just joined the active topology detects that its stack MAC address is not configured or is different than the stack MAC address in use, it logs the following message at the Error log level:

```
The stack MAC address is not correctly configured on this node. The
stack can not operate properly in this condition. Please correct and
reboot.
```

If you have not configured (or inconsistently configured) the stack MAC address you might encounter difficulty in diagnosing the resulting problems. Whenever the master node (including itself) detects that one or more nodes in its active topology do not have the correct or any stack MAC address configured, it displays the following message to the console every five minutes until you configure a MAC address and restart the node(s):

```
The stack MAC address is either not configured or its configuration is
not consistent within the stack. The stack can not operate properly in
this condition. Please correct and reboot.
```

Example

To select the node to which you have logged in to supply the MAC address for stack MAC address formation:

```
configure stacking mac-address
```

To select a node other than the one to which you are logged in to supply the MAC address for stack MAC address formation:

```
configure stacking node-address 00:04:96:26:6b:ed mac-address
```

To select an active node to supply the MAC address for stack MAC address formation:

```
configure stacking slot 4 mac-address
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking master-capability

```
configure stacking [node-address node_address | slot slot_number]
   master-capability [on | off]
```

Description

The command configures a node to be allowed to operate as either a backup or master, or prevents a node from operating as either.

The command controls the setting on the specified node only. To set the master capability for all nodes on a stack, you can use the command `configure stacking redundancy [none | minimal | maximal]`.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.
slot_number	Specifies the slot number of the target active node. To view the slot numbers, enter the `show stacking` command.

Default

Master-capability is On.

Usage Guidelines

At least one node in the stack topology must be master-capable.

If you attempt to disable the master-capability of the only master capable node in a stack topology, the attempt is denied and following message appears:

```
Error: At least one node must have Master-capability configured "on".
```

This command is used to set up master-capability manually. It can also be used to adjust the result achieved when the `configure stacking redundancy [none | minimal | maximal]` command is used.

The setting takes effect the next time the node reboots. When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified
node(s).
```

Example

To turn on the master capability for a node:

```
configure stacking node-address 00:04:96:26:6b:ed master-capability on
```

To turn on the master capability of an active node currently occupying slot 4:

```
configure stacking slot 4 master-capability on
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking node-address

`configure stacking` **`node-address`** *`node_address`* **`slot-number`** *`slot_number`*

Description

Configures a slot number on one or all nodes in the stack topology.

Syntax Description

`node_address`	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.
`slot_number`	Specifies a number between 1 and 8 that is to be assigned as the slot number of the target node.

Default

The default slot-number for a node in stacking mode is 1.

Usage Guidelines

The configuration is stored on the affected node(s) immediately but does not take effect until the next reboot of the node(s). The configuration applies only when the node is running in stacking mode. To see the configured and active slot numbers of all nodes, use the `show stacking configuration` command.

If a node-address and a slot number are specified, then the node is configured with the specified slot number. There is no check for a duplicate slot number at this time; the number is simply assigned as requested.

To see the resulting slot number assignment, run the `show stacking configuration` command.

Note

Failure to configure a node does not prevent configuration of the slot numbers on the other nodes, and does not affect the slot number assigned to each node.

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified
node(s).
```

Example

To configure slot number 4 for the node with MAC address 00:04:96:26:6b:ed:

```
configure stacking node-address 00:04:96:26:6b:ed slot-number 4
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking priority

```
configure stacking {node-address node-address | slot slot_number}
   priority [node_pri | automatic]
```

Description

Configures a priority value to be used to influence master and backup election.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the `show stacking` command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the `show stacking` command.
node_pri	Specifies the priority as a value between 1 and 100.

Default

Automatic priority.

Usage Guidelines

The node role election priority is a value that is internally calculated by ExtremeXOS for each node. This calculated value helps determine which nodes are elected as master and backup. For more information, see “Configuring the Master, Backup, and Standby Roles” in the *Switch Engine 32.2 User Guide*.

This command allows you to configure a priority value that affects the outcome of this calculation. You can configure the priority on any node in a stack topology. You can specify an integer node-pri value between 1 and 100. The larger the value, the greater the node role election priority.

If no node address or slot is specified, the command takes effect on all nodes at the next node role election cycle. Priority configuration has no operational effect on switches that are not in stacking mode.

If configured on every node, automatic priority commands ExtremeXOS to determine the node role election priority of each active node. Currently, the automatic priority algorithm chooses the master-capable node with the lowest slot number as master and the node with the second lowest slot number as backup. Extreme networks may alter this behavior in later releases.

If you have configured a node with automatic priority and if you have configured another node to use a node-pri value, the node with automatic priority uses zero as the node-priority value during the node role election.

Example

To allow ExtremeXOS to determine node role election priority:

```
configure stacking priority automatic
```

To configure the node priority for the stackable in slot 4:

```
configure stacking slot 4 priority 50
```

To configure the automatic priority algorithm for the stackable with node address 00:04:96:26:6b:ed:

```
configure stacking node-address 00:04:96:26:6b:ed priority automatic
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking redundancy

```
configure stacking redundancy [none | minimal | maximal]
```

Description

This command sets a master-capability value for every node in the stack topology.

Syntax Description

none	Only one node has master-capability turned on and all other nodes have master-capability turned off.
minimal	Two nodes have master-capability turned on and all other nodes have master-capability turned off.
maximal	All nodes have master-capability turned on.

Default

Default value in an unconfigured stack is maximal.

Usage Guidelines

If there are more than eight nodes in the stack topology, the following message appears and the command is not executed:

```
ERROR: This command can only be used when the stack has eight nodes or less.
```

Since only eight nodes can be operational in an active topology at a time, you must disconnect the remaining nodes before configuring master-capability with this command.

If you are using the none or minimal redundancy configuration:

- The configured values of slot-number and priority decide the nodes on which the master-capability should be turned on.
- If the priority values are configured on the nodes, the highest priority node(s) are chosen.
- If the priority values of all nodes are set to automatic or to the same priority value, the node(s) with the lowest slot number(s) are chosen. Extreme Networks may change automatic priority behavior in a future release.

If there is a slot number tie or if the slot numbers were never configured, the following message appears and the command is not executed:

```
ERROR: Unique slot numbers must be configured before using this command.
```

The setting takes effect at the next restart of the node. The following message appears after the command is successfully executed:

```
This command will take effect at the next reboot of the specified node(s).
```

Redundancy configuration has no operational effect on a node that is not in stacking mode.

Example

To turn on master-capability on all nodes:

```
configure stacking redundancy maximal
```

To turn on master-capability on only one node:

```
configure stacking redundancy none
```

To turn on master-capability on two nodes:

```
configure stacking redundancy minimal
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking slot-number automatic

```
configure stacking slot-number automatic
```

Description

Configures a slot number on all nodes in the stack topology, selecting the number automatically.

Syntax Description

automatic	Configures slot numbers on every node in the stack, selecting the number automatically. If there are more than eight nodes in the stack topology, the assignment is only performed on the first eight nodes. Automatic slot number assignment causes assignment of slot numbers starting from 1 and increasing up to 8. The nodes in the stack topology are assigned the numbers in the order in which they would appear currently in the `show stacking` command output. In a ring, slot number 1 is assigned to the current node, slot number 2 is assigned to the node connected to the current node's stack port 2, and so forth. In a daisy chain, slot 1 is assigned to the node at the end of the chain that begins with the node connected to the current node's stack port 1.

Default

The default slot-number for a node in stacking mode is 1.

Usage Guidelines

The configuration is stored on the affected node(s) immediately but does not take effect until the next reboot of the node(s). The configuration applies only when the node is running in stacking mode. To see the configured and active slot numbers of all nodes, use the `show stacking configuration` command.

To see the resulting slot number assignment, run the `show stacking configuration` command.

Note

Failure to configure a node does not prevent configuration of the slot numbers on the other nodes, and does not affect the slot number assigned to each node.

If you enter the command with the automatic option, the following confirmation message appears:

```
Reassignment of slot numbers may make the stack incompatible with the
current configuration file. Do you wish to continue? (y/n)
```

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified
node(s).
```

Example

To configure all slot-numbers for a stack:

```
configure stacking slot-number automatic
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the *Switch Engine 32.2 Feature License Requirements* document.

configure stacking-support auto-discovery

```
configure stacking-support auto-discovery [disable | enable]
```

Description

Enables or disables stacking auto-discovery.

Syntax Description

stacking-support	Configures stacking support.
auto-discovery	Configures auto-discovery for stacking.
disable	Disables stacking auto-discovery.
enable	Enables stacking auto-discovery. (Default)

Default

Stacking auto-discovery is enabled by default.

Usage Guidelines

For ExtremeSwitching 5420 and 5520 series switches, stacking auto-discovery allows the switch to detect the type of cable inserted into the stack ports and automatically update the stack port speed while the switch is booting up.

To view stacking auto-discovery status, use the command `show stacking-support`.

Example

The following example disables stacking auto-discovery:

```
# configure stacking-support auto-discovery disable
```

History

This command was first available in ExtremeXOS 30.3.

Platform Availability

This command is available on ExtremeSwitching 5420 and 5520 series switches.

configure stacking-support stack-ports

```
configure stacking-support stack-port [stack-ports | all] selection
   [native {V40 | V80 | V160 | V200 | V320 | V400 {alternative-
   configuration | help}} | alternate]
```

Description

Selects the switch ports and speed for stack communications.

Syntax Description

stack-ports	Specifies the stacking port range to be configured. Valid stacking port entries are 1, 2, 1-2, and all.
native	Selects the specified stacking port, which is the native, dedicated port that only supports stacking.
V40	Specifies that the native stacking port can operate at 10 Gbps.
V80	Specifies that the native stacking port can operate at 20 Gbps.
V160	Specifies that the native stacking ports operate at 40 Gbps.
V200	Specifies that the native stacking ports operate at 50 Gbps
V320	Specifies that the native stacking ports operate at 80 Gbps.
V400	Specifies that the native stacking ports on the option card operate at 100 Gbps (Not available on Universal platforms).
alternative-configuration	Selects the V400 alternate configuration stacking mode for (ExtremeSwitchin 5720 series switches).
help	Provides more details regarding the alternate configuration stacking mode
alternate	Selects the alternate (Ethernet) stacking port associated with the specified stacking port. The alternate port numbers are listed in the following table.

Default

Switches with native stack ports default to "Native".

Usage Guidelines

The configuration entered with this command applies to only the local node and does not become active until after the following events:

- The stacking-support option is enabled (if applicable).
- The switch restarts.

Each speed configuration requires a specific cabling configuration. For more information, see *Hardware Installation Guide* for your switch model.

"V400" is the default mode that sets the stack ports to 106G. "V400 alternative-configuration" is required when using specific fiber cables. This mode sets the stack ports to 100G, enables pre-emphasis, and FEC (clause_91). Cables requiring alternative-configuration include:

- QSFP28 SR4
- QSFP28 LR4
- QSFP28 CWDM4
- QSFP28 PSM4
- QxQ AOC cable - 5m
- QxQ AOC cable - 7m
- QxQ AOC cable - 10m
- QxQ AOC cable - 20m

For a complete list of supported cables, see *Extreme Optics Compatibility*.

The stacking-support option configures the switch to use stacking protocols. This option is automatically enabled on most platforms, but some platforms require you to manually enable the stacking-support option. The following table lists the ExtremeSwitching series switches and option card configurations that support Stacking Port Selection Control, and it lists which platforms require manual Stacking-Support Option Control.

Table 18: ExtremeSwitching Series Switch Support for Alternate Stack Ports

Switch Model Number	Switch Option Card	Alternate Port for Stack Port	Alternate Port for Stack Port	Stacking-Support Option Control	Stacking Port Selection Control
5520-24T 5520-24W 5520-24X	5520-VIM-4X	35	36	Yes	Yes
5520-48T 5520-48W 5520-12MW-36W 5520-48SE	5520-VIM-4X	59	60	Yes	Yes

When the alternate stack port is selected for a native stack port and the switch is restarted, the native stack port remains visible in the CLI and can be configured. However, any configuration applied to the replaced stack port is ignored and does not affect switch operation.

An alternate stack port runs the stacking protocol and cannot operate on a link connected to a data port that is not configured as a stack port. Both ends of a stack link must be configured to use the stacking protocol. The stacking link must be directly connected to two the alternate stacking ports of two stacking switches. The direct connection is necessary because stacking protocols cannot pass through an intermediate switch.

After a data port is reconfigured as an alternate stack port, all data port configuration commands still work, but they do not change the operation of the alternate stack port. The LEDs on an Ethernet port used as an alternate stacking port operate according to the behavior of the Ethernet port. The LEDs on the related (disabled) native stacking port remain dark.

Note

Commands that contain the **stacking-support** keyword operate only on the local switch; they do not apply to all switches in the stack. If an active stack topology has been formed, you can telnet to a slot elsewhere in the stack, log on to that switch, and use commands with the stacking-support keyword on that switch.

Example

The following command configures the switch to use the alternate stack port for Stack Port 1 after the next switch restart:

```
configure stacking-support stack-ports 1 selection alternate
```

The following command configures the switch to use both native stacking ports after the next switch restart:

```
configure stacking-support stack-ports all selection native
```

The following command configures stack ports 1 and 2 to operate as four 40 Gbps ports:

```
configure stacking-support stack-ports all selection native V160
```

History

This command was first available in ExtremeXOS 12.5.

The V160 keyword was added in ExtremeXOS 12.6.

The V320 keyword was added in ExtremeXOS 15.1 Revision 2.

The V400 keyword was added in ExtremeXOS 22.2.

The **alternative-configuration** and **help** keywords were added in ExtremeXOS 32.2.

The V40 keyword was added in ExtremeXOS 31.3

The V80 keyword was added in ExtremeXOS 31.4.

The V200 keyword was added in ExtremeXOS 31.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd add vlan

```
configure stpd stpd_name add [ {vlan} vlan_name | vlan vlan_list] ports
   [all | port_list] {[dot1d | emistp | pvst-plus]}
```

Description

Adds all ports or a list of ports within a *VLAN* to a specified *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
all	Specifies all of the ports in the VLAN to be included in the STPD.
port_list	Specifies the port or ports to be included in the STPD.
dot1d	Specifies the *STP* encapsulation mode of operation to be 802.1D.

emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Default port mode for default STPD (s0) and user-created STPDs is dot1d.

Usage Guidelines

To create an STP domain, use the `create stpd` command. To create a VLAN, use the `create vlan` command.

In an EMISTP or PVST+ environment, this command adds a list of ports within a VLAN to a specified STPD provided the carrier VLAN already exists on the same set of ports. You can also specify the encapsulation mode for those ports.

In an *MSTP* environment, you do not need a carrier VLAN. A CIST controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate region status. You must use the dot1d encapsulation mode in an MSTP environment.

You cannot configure STP on the following ports:

- Mirroring target ports.
- Software-controlled redundant ports.

If you see an error similar to the following:

```
Error: Cannot add VLAN default port 3:5 to STP domain
```

You might be attempting to add:

- A carrier VLAN port to a different STP domain than the carrier VLAN belongs.
- A VLAN/port for which the carrier VLAN does not yet belong.

Note

This restriction is enforced only in an active STP domain and when you enable STP to make sure you have a legal STP configuration.

Care must be taken to ensure that ports in overlapping domains do not interfere with the orderly working of each domain's protocol.

By default, when the switch boots for the first time, it automatically creates a VLAN named default with a tag value of 1 and STPD s0. The switch associates VLAN default to STPD s0. All ports that belong to this VLAN and STPD are in 802.1D encapsulation mode with autobind enabled. If you disable autobind on the VLAN default, that configuration is saved across a reboot.

Naming Conventions

If your STPD has the same name as another component, for example a VLAN, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keywords **stpd** and **vlan** are optional.

STP Encapsulations Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

These encapsulation modes are for STP ports, not for physical ports. When a physical port belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

STPD Identifier

An StpdID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STPD and that VLAN cannot belong to another STPD.

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the Common and Internal Spanning Tree (CIST). The switch assigns this ID automatically when you configure the CIST STPD. A multiple spanning tree instance identifier identifies each STP domain that is part of an MSTP region. You assign the *MSTI (Multiple Spanning Tree Instances)* ID when configuring the STPD that participates in the MSTP region. In an MSTP region, MSTI IDs only have local significance. You can reuse MSTI IDs across MSTP regions.

Automatically Inheriting Ports--MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an MSTI in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Example

Create a VLAN named marketing and an STPD named STPD1 as follows:

```
create vlan marketing
create stpd stpd1
```

The following command adds the VLAN named marketing to the STPD STPD1, and includes all the ports of the VLAN in STPD1:

```
configure stpd stpd1 add vlan marketing ports all
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd backup-root

```
configure stpd stpd_name backup-root [on | off]
```

Description

Enables and disables the backup root feature.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
on	Enables backup root.
off	Disable backup root.

Default

By default, the backup root feature is disabled.

Usage Guidelines

The backup root feature is used to get faster convergence when the root bridge connectivity is lost.

Backup root feature enabled bridge port should be connected to Root with point to point link. When backup root bridge loses contact with the root bridge, the backup root bridge automatically lowers its bridge priority below the priority of the lost root. This causes the backup root bridge to become the new root. If a reboot occurs, the new root will have its priority restored to the original configured value.

If the priority of the root bridge is zero and the backup root loses connectivity to the root bridge, automatic assignment of the priority value for the backup root will be the initial configured value.

This feature is activated only when connectivity with the root bridge is lost. Raising the priority on the root does not cause the backup root feature to be activated.

We recommend the following when configuring the backup root feature:

- Enable the backup root feature on both the root and backup root.
- Configure all bridges except the root and backup root with the maximum bridge priority value (61440 with 802.1t).
- Configure the root and backup root to have the next lowest priority (57344 with 802.1t)
- To help prevent the backup root feature activating due to a simple link failure rather than a bridge failure, establish multiple links between the root and backup root.
- Deploy this feature carefully as it may result in suboptimal traffic forwarding paths.

Example

The following example enables the backup root feature on the *STP* domain r1:

```
configure stpd r1 backup-root on
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd bpdu-forwarding

```
configure stpd bpdu-forwarding [on | off]
```

Description

This command specifies whether to forward or drop BPDUs when *STP* is disabled.

Syntax Description

bpdu-forwarding	Specifies forwarding or discarding spanning tree BPDUs when STP is disabled.
on	Forward STP BPDUs when spanning tree is disabled (default).
off	Drop STP BPDUs when spanning tree is disabled.

Default

The default is on.

Usage Guidelines

STP must be disabled globally to disable BPDU forwarding; otherwise, an error message appears:

```
Error: All Spanning Tree Domains must be disabled globally before configuring stpd bpdu-forwarding off.
```

When the BPDU forwarding is off and you try to configure the filter method using the `configure stpd filter-method [system-wide| port-based]` command, the following error message appears:

```
Error: Spanning Tree Forwarding must be enabled globally before configuring filter-method.
```

Example

The following example disables BPDU forwarding when STP is disabled:

```
configure stpd bpdu-forwarding off
```

History

This command was first available in ExtremeXOS 22.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd default-encapsulation

`configure stpd` *`stpd_name`* **`default-encapsulation`** `[`**`dot1d`** | **`emistp`** | **`pvst-plus`**`]`

Description

Configures the default encapsulation mode for all ports added to the specified *STPD*.

Syntax Description

`stpd_name`	Specifies an STPD name on the switch.
`dot1d`	Specifies the *STP* encapsulation mode of operation to be 802.1d.
`emistp`	Specifies the STP encapsulation mode of operation to be EMISTP.
`pvst-plus`	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Ports in the default STPD (s0) are dot1d mode.

Ports in user-created STPDs are in dot1d mode.

Usage Guidelines

Care must be taken to ensure that ports in overlapping domains do not interfere with the orderly working of each domain's protocol.

By default, when the switch boots for the first time, it automatically creates a *VLAN* named default with a tag value of 1 and STPD s0. The switch associates VLAN default to STPD s0. All ports that belong to this VLAN and STPD are in 802.1d encapsulation mode with autobind enabled. If you disable autobind on the VLAN default, that configuration is saved across a reboot.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

Naming Conventions

If your STPD has the same name as another component, for example a VLAN, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional. For name creation guidelines and a list of reserved names, see *Object Name* in the *Switch Engine 32.2 User Guide*.

STP Encapsulation Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

Note

These encapsulation modes are for STP ports, not for physical ports. When a physical port belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

STPD Identifier

An StpdID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STP domain, and that VLAN cannot belong to another STPD.

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the Common and Internal Spanning Tree (CIST). The switch assigns this ID automatically when you configure the CIST STPD. A multiple spanning tree instance identifier identifies each STP domain that is part of an MSTP region. You assign the *MSTI* ID when configuring the STPD that

participates in the MSTP region. In an MSTP region, MSTI IDs only have local significance. You can reuse MSTI IDs across MSTP regions.

Example

The following example specifies that all ports subsequently added to the STPD STPD1 be in PVST+ encapsulation mode unless otherwise specified or manually changed:

```
configure stpd stpd1 default-encapsulation pvst-plus
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd delete vlan

```
configure stpd stpd_name delete [ {vlan} vlan_name | vlan
   vlan_list]ports [all | port_list]
```

Description

Deletes one or more ports in the specified *VLAN* from an *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies a VLAN name.
vlan_list	Specifies a VLAN list of IDs.
all	Specifies that all of the ports in the VLAN are to be removed from the STPD.
port_list	Specifies the port or ports to be removed from the STPD.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keywords stpd and vlan are optional.

In EMISTP and PVST+ environments, if the specified VLAN is the carrier VLAN, all protected VLANs on the same set of ports are also removed from the STPD.

You also use this command to remove autobind ports from a VLAN. ExtremeXOS records the deleted ports so that the ports are not automatically added to the STPD after a system restart.

When a port is deleted on the *MSTI*, it is automatically deleted on the CIST as well.

Example

The following example removes all ports of a VLAN named Marketing from the STPD STPD1:

```
configure stpd stpd1 delete vlan marketing ports all
```

History

This command was first available in ExtremeXOS 10.1.

The *vlan_list* variable was added in ExtremeXOS 16.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd description

`configure {stpd} stpd_name description [stpd-description | none}`

Description

Adds or overwrites the *STP* domain description field.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
stpd-description	Specifies an STPD description.
none	Clears the STPD string.

Default

The STP domain description string is empty.

Usage Guidelines

Use this command to add or overwrite the STP domain description field.

The maximum STP domain description length is 180 characters.

The stpd-description must be in quotes if the string contains any spaces.

To display the description, use the `show stpd stpd_name` command. When no STP domain description is configured, Description is not displayed in the output.

To clear the STP domain description string, either specify the keyword none in this command or use the `unconfigure stpd {stpd_name}` command.

Example

The following command adds the description “this is s0 domain” to the STPD named s0:

```
configure stpd s0 description “this is s0 domain”
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd filter-method

`configure stpd filter-method [system-wide| port-based]`

Description

Configures Spanning Tree BPDU hardware filters.

Syntax Description

system-wide	Installs system-wide hardware filters for Spanning Tree.
port-based	Installs per-port hardware filters for Spanning Tree.

Default

By default, system-wide hardware filters are installed.

Usage Guidelines

You must disable Spanning Tree before changing the filter method. Use the `disable stpd` command to disable Spanning Tree.

Example

The following example sets the filter method for Spanning Tree as system-wide.

```
configure stpd filter-method system-wide
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd flush-method

```
configure stpd flush-method [vlan-and-port | port-only]
```

Description

Configures the method used by *STP* to flush the *FDB* during a topology change.

Syntax Description

vlan-and-port	Specifies a *VLAN* and port combination flush method.
port-only	Specifies a port flush method.

Default

The default flush method is vlan-and-port.

Usage Guidelines

For scaled up configurations where there are more than 1000 VLANs and more than 70 ports participating in STP, the number of messages exchanged between STP/FDB/HAL modules can consume a lot of system memory during an STP topology change using the default configuration for flush method. In such situations, setting the flush method to “port-only” can help reduce the system memory consumption.

Example

The following command sets the flush method to port-only:

```
configure stpd flush-method port-only
```

History

This command was available in ExtremeXOS 12.4.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd forwarddelay

```
configure stpd stpd_name forwarddelay seconds
```

Description

Specifies the time (in seconds) that the ports in this *STPD* spend in the listening and learning states when the switch is the root bridge.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the forward delay time in seconds. The default is 15 seconds, and the range is 4 to 30 seconds.

Default

The default forward delay time is 15 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the *seconds* parameter is 4 through 30 seconds.

Example

The following command sets the forward delay from STPD1 to 20 seconds:

```
configure stpd stpd1 forwarddelay 20
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd hellotime

```
configure stpd stpd_name hellotime seconds
```

Description

Specifies the time delay (in seconds) between the transmission of BPDUs from this *STPD* when it is the root bridge.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the hello time in seconds. The default is 2 seconds, and the range is 1 to 10 seconds.

Default

The default hello time is 2 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

In an *MSTP* environment, configure the hello timer only on the CIST, not on the MSTIs.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the *seconds* parameter is 1 through 10 seconds.

Example

The following command sets the time delay from STPD1 to 10 seconds:

```
configure stpd stpd1 hellotime 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd loop-protect event-threshold

```
configure stpd stpd_name loop-protect event-threshold [threshold | none]
```

Description

Configures the loop protect event threshold.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
threshold	Sets the number of loop protect events that must be received before disabling the port. The valid range is 1–10.
none	Disables the loop protect threshold. The port will not remain enabled even if loop protect events are received.

Default

By default, the loop protect threshold is enabled and set to three loop protect events.

Usage Guidelines

If the loop protect event threshold disables a port, you must enable the port manually.

Example

The following example configures the loop protect event threshold to five events.

```
configure stpd r1 loop-protect event-threshold 5
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd loop-protect event-window

```
configure stpd stpd_name loop-protect event-window interval
```

Description

Configures the interval for which loop protect events are counted by the loop protect event threshold.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
interval	The length of the interval, in seconds, over which the loop protect event threshold is defined. The valid range is 0–255 seconds.

Default

By default the interval is set to 180 seconds.

Usage Guidelines

None.

Example

The following example sets the loop protect event window to 120 seconds for *STP* domain r1.

```
configure stpd r1 loop-protect event-window 120
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd maxage

```
configure stpd stpd_name maxage seconds
```

Description

Specifies the maximum age of a BPDU in the specified *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the maxage time in seconds. The default is 20 seconds, and the range is 6 to 40 seconds.

Default

The default maximum age of a BPDU is 20 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

In an *MSTP* environment, configure the maximum age of a BPDU only on the CIST, not on the MSTIs.

The range for the *seconds* parameter is 6 through 40 seconds.

Note that the time must be greater than, or equal to 2 * (Hello Time + 1) and less than, or equal to 2 * (Forward Delay –1).

Example

The following command sets the maximum age of STPD1 to 30 seconds:

```
configure stpd stpd1 maxage 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd max-hop-count

`configure stpd` *stpd_name* **max-hop-count** *hopcount*

Description

Specifies the maximum hop count of a BPDU until the BPDU is discarded in the specified *MSTP* *STP* domain.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
hopcount	Specifies the number of hops required to age out information and notify changes in the topology. The default is 20 hops, and the range is 6 to 40 hops.

Default

The default hop count of a BPDU is 20 hops.

Usage Guidelines

This command is applicable only in an MSTP environment.

If your STPD has the same name as another component, for example a *VLAN*, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the *hopcount* parameter is 6 through 40 hops.

In an MSTP environment, the hop count has the same purpose as the maxage timer for 802.1D and 802.1w environments.

The main responsibility of the CIST is to exchange or propagate BPDUs across regions. The switch assigns the CIST an instance ID of 0, which allows the CIST to send BPDUs for itself in addition to all of the MSTIs within an MSTP region. Inside a region, the BPDUs contain CIST records and piggybacked M-records. The CIST records contain information about the CIST, and the M-records contain information about the MSTIs. Boundary ports only exchange CIST record BPDUs.

On boundary ports, only CIST record BPDUs are exchanged. In addition, if the other end is an 802.1D or 802.1w bridge, the maxage timer is used for interoperability between the protocols.

Example

The following command sets the hop of the MSTP STPD, STPD2, to 30 hops:

```
configure stpd stpd2 max-hop-count 30
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd mode

```
configure stpd stpd_name mode [dot1d | dot1w | mstp [cist | msti
   instance]]
```

Description

Configures the operational mode for the specified *STP* domain.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
dot1d	Specifies the STPD mode of operation to be 802.1D.
dot1w	Specifies the STPD mode of operation to be 802.1w, and rapid configuration is enabled.
mstp	Specifies the STPD mode of operation to be 802.1s, and rapid configuration is enabled.
cist	Configures the specified STPD as the common instance spanning tree for the *MSTP* region.
msti	Configures the specified STPD as a multiple spanning tree instance for the MSTP region.
instance	Specifies the Id of the multiple spanning tree instance. The range is 1 to 4,094.

Default

The STPD s0 by default operates in MSTP CIST mode.

User-created STPDs operate by default in dot1d mode.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

If you configure the STP domain in 802.1D mode, the rapid reconfiguration mechanism is disabled.

If you configure the STP domain in 802.1w mode, the rapid reconfiguration mechanism is enabled. You enable or disable RSTP on a per STPD basis only. You do not enable RSTP on a per port basis.

If you configure the STP domain in MSTP mode, the rapid reconfiguration mechanism is enabled. You enable or disable MSTP on a per STPD basis only. You do not enable MSTP on a per port basis. MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

You must first configure a Common and Internal Spanning Tree (CIST) before configuring any multiple spanning tree instances (MSTIs) in the region. You cannot delete or disable a CIST if any of the MSTIs are active in the system.

STP operational mode can be changed while VLANs are associated with an STP domain. In MSTP mode, mode change is allowed only for CIST domains.

Example

The following command configures STPD s1 to enable the rapid reconfiguration mechanism and operate in 802.1w mode:

```
configure stpd s1 mode dot1w
```

The following command configures STPD s2 to operate as an *MSTI* in an MSTP domain:

```
configure stpd s2 mode mstp msti 3
```

History

This command was first available in ExtremeXOS 10.1.

The mstp parameter was added in ExtremeXOS 11.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd multicast send-query

```
configure stpd multicast send-query [on | off]
```

Description

Configures suppressing *IGMP*- and MLD-triggered queries when *STP* topology changes are received.

Syntax Description

multicast	Specifies multicast options.
send-query	For VLANs associated with STPD, when topology changes occur, send or suppress IGMP or MLD queries.
on	Send IGMP or MLD queries (default).
off	Do not send IGMP or MLD queries.

Default

Sending IGMP or MLD queries is on.

Usage Guidelines

Whenever STP topology changes are received on a port, the switch sends triggered queries that mark the peer port as a router port and floods all multicast packets towards this port. This can cause unnecessary bandwidth usage. This command allows you to allow or suppress this forwarding.

Example

The following example turns off IGMP and MLD queries:

```
# configure stpd multicast send-query off
```

History

This command was first available in ExtremeXOS 21.1.5-Patch1-2.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports active-role disable

`configure stpd` *`stpd_name`* **`ports active-role disable`** *`port`*

Description

Allows a port to be selected as an alternate or backup port.

Syntax Description

`stpd_name`	Specifies an *STPD* name on the switch.
`port`	Specifies a port.

Default

The default is disabled.

Usage Guidelines

Use this command to revert to the default that allows a specified port to be elected to any *STP* port role.

Example

The following command disables an active role on STDP s1, port 6:3:

```
configure stpd s1 ports active-role disable 6:3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports active-role enable

```
configure stpd stpd_name ports active-role enable port
```

Description

Prevents a port from becoming an alternate or backup port.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
port	Specifies a port.

Default

The default is disabled.

Usage Guidelines

Use this command to keep a port in an active role. It prevents a specified port from being elected to an alternate or backup role which puts the port in a blocking state.

The following describes the port role and state when RSTP stabilizes.

STP Port Role	Port State
Alternate (inactive)	Blocking
Backup (inactive	Blocking
Root (active)	Forwarding
Designated (active)	Forwarding

This feature can be enabled on only one *STP* port in the STP domain.

The restricted port role cannot be combined with this feature.

An active port role (root or designated) cannot be enabled with an edge port.

To disable this command, use the `configure stpd ports active-role disable` command.

To view the status of the active role, use the `show stpd ports` command.

Example

The following command enables an active role on STDP s1, port 6:3:

```
configure stpd s1 ports active-role enable 6:3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports auto-edge

```
configure stpd stpd_name ports auto-edge [on | off] port_list
```

Description

Enables and disables auto-edge detection.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
on	Enables auto-edge detection on the specified port.
off	Disables auto-edge detection on the specified port.
port_list	Specifies one or more ports or slots and ports.

Default

By default, auto-edge detection is on.

Usage Guidelines

None.

Example

The following example enables auto-edge detection on port 1:10 in *STP* domain r1:

```
configure stpd r1 ports auto-edge on 1:10
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports bpdu-restrict

```
configure {stpd} stpd_name ports bpdu-restrict [enable | disable]
   port_list {recovery-timeout {seconds}}
```

Description

Configures BPDU Restrict.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
port_list	Specifies one or more ports or slots and ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

The default is disabled.

Usage Guidelines

Before using this command, the port(s) should be configured for edge-safeguard.

Example

The following command enables bpdu-restrict on port 2 of STPD s1:

```
configure stpd s1 ports bpdu-restrict enable 2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports cost

```
configure stpd stpd_name ports cost [auto | cost] port_list
```

Description

Specifies the path cost of the port in the specified *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
auto	Specifies the switch to remove any user-defined port cost value(s) and use the appropriate default port cost value(s).
cost	Specifies a numerical port cost value. The range is 1 through 200,000,000.
port_list	Specifies one or more ports or slots and ports.

Default

The switch automatically assigns a default path cost based on the speed of the port, as follows:

- 10 Mbps port—the default cost is 2,000,000.
- 100 Mbps port—the default cost is 200,000.
- 1000 Mbps port—the default cost is 20,000.
- 10000 Mbps ports—the default cost is 2,000.

The default port cost for trunked ports is dynamically calculated based on the available bandwidth.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The 802.1D-2004 standard modified the default port path cost value to allow for higher link speeds. If you have a network with both 802.1D-2004 and 802.1D-1998 compliant bridges, a higher link speed can create a situation whereby an 802.1D-1998 compliant bridge could become the most favorable transit path and possibly cause the traffic to span more bridges. To prevent this situation, configure the port path cost to make links with the same speed use the same path host value. For example, if you have 100 Mbps links on all bridges, configure the port path cost for the 802.1D-2004 compliant bridges to 19 instead of using the default 200,000.

Note

You cannot configure the port path cost on 802.1D-1998 compliant bridges to 200,000 because the path cost range setting is 1 to 65,535.

The range for the cost parameter is 1 through 200,000,000. If you configure the port cost, a setting of 1 indicates the highest priority.

If you configured a port cost value and specify the auto option, the switch removes the user-defined port cost value and returns to the default, automatically assigned, port cost value.

The auto port cost of a trunk port is calculated based on number member ports in the trunk port. Link up and down of the member port does not affect the trunk port cost, thus it does not trigger topology change. Only adding or removing a member port to/from the trunk port causes auto trunk port cost to change. Also, by so configuring a static trunk port cost, the value is frozen regardless of the number of member ports in the trunk port.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the default costs are different than switches running ExtremeXOS 11.6 and later.

The range for the cost parameter is 1 through 65,535.

The switch automatically assigns a default path cost based on the speed of the port, as follows:

- 10 Mbps port—the default cost is 100.
- 100 Mbps port—the default cost is 19.
- 1000 Mbps port—the default cost is 4.
- 10000 Mbps ports—the default cost is 2.

Example

The following command configures a cost of 100 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports cost 100 2:1-2:5
```

History

This command was first available in ExtremeXOS 10.1.

The auto option was added in ExtremeXOS 11.0.

The default costs were updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports edge-safeguard disable

```
configure {stpd} stpd_name ports edge-safeguard disable port_list {bpdu-
   restrict} {recovery-timeout {seconds}}
```

Description

Disables the edge safeguard loop prevention on the specified RSTP or *MSTP* edge port.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
port_list	Specifies one or more edge ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

By default, this feature is disabled.

Usage Guidelines

This command applies only to ports that have already been configured as edge ports.

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs.

If you disable this feature, the edge port enters the forwarding state but no longer transmits BPDUs unless a BPDU is received by that edge port. This is the default behavior.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the `configure stpd stpd_name ports bpdu-restrict disableport_list` command.

If edge safeguard is disabled, BPDU restrict is also disabled.

To view the status of the edge safeguard feature use the `show {stpd} stpd_name ports {[detail |port_list {detail}]}` command. You can also use the `show stpd {stpd_name | detail}` command to display the STPD configuration on the switch, including the enable/disable state for edge safeguard.

Note

In MSTP, configuring edge safeguard at CIST will be inherited in all *MSTI*.

To enable or re-enable edge safeguard, use one of the following commands:

- `configure {stpd} stpd_name ports edge-safeguard enableport_list {bpdu-restrict} {recovery-timeout {seconds}}`
- `configure stpd stpd_name ports link-type [[auto | broadcast | point-to-point]port_list | edgeport_list {edge-safeguard [enable | disable] {bpdu-restrict} {recovery-timeoutseconds}}]`

Example

The following command disables edge safeguard on RSTP edge port 4 in STPD s1 on a stand-alone switch:

```
configure stpd s1 ports edge-safeguard disable 4
```

History

This command was first available in ExtremeXOS 11.4.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports edge-safeguard enable

```
configure {stpd} stpd_name ports edge-safeguard enable port_list {bpdu-
   restrict} {recovery-timeout {seconds}}
```

Description

Enables the edge safeguard loop prevention on the specified RSTP or *MSTP* edge port.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
port_list	Specifies one or more edge ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

By default, this feature is disabled.

Usage Guidelines

This command applies only to ports that have already been configured as edge ports.

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. You configure edge safeguard on RSTP or MSTP edge ports to prevent accidental or deliberate misconfigurations (loops) resulting from connecting two edge ports together or by connecting a hub or

other non-*STP* switch to an edge port. Edge safeguard also limits the impact of broadcast storms that might occur on edge ports.

An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs. This advanced loop prevention mechanism improves network resiliency but does not interfere with the rapid convergence of edge ports.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the `configure {stpd} stpd_name ports bpdu-restrict [enable | disable]port_list {recovery-timeout {seconds}}` command and selecting disable.

If edge safeguard is disabled, BPDU restrict is also disabled.

To view the status of the edge safeguard feature use the `show {stpd} stpd_name ports {[detail |port_list {detail}]}` command. You can also use the `show stpd {stpd_name | detail}` command to display the STPD configuration on the switch, including the enable/disable state for edge safeguard.

Note

In MSTP, configuring edge safeguard at CIST will be inherited in all *MSTI*.

To disable edge safeguard, use one of the following commands:

- `configure {stpd} stpd_name ports edge-safeguard disableport_list {bpdu-restrict} {recovery-timeout {seconds}}`
- `configure stpd stpd_name ports link-type [[auto | broadcast | point-to-point]port_list | edgeport_list {edge-safeguard [enable | disable] {bpdu-restrict} {recovery-timeoutseconds}}]`

Example

The following command enables edge safeguard on RSTP edge port 4 in STPD s1 on a stand-alone switch:

```
configure stpd s1 ports edge-safeguard enable 4
```

History

This command was first available in ExtremeXOS 11.4.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports link-type

```
configure stpd stpd_name ports link-type [[auto | broadcast | point-to-
   point] port_list | edge port_list {edge-safeguard [enable | disable]
   {bpdu-restrict} {recovery-timeout seconds}}]
```

Description

Configures the ports in the specified *STPD* as auto, broadcast, edge, or point-to-point link types.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
auto	Specifies the switch to automatically determine the port link type. An auto link behaves like a point-to-point link if the link is in full-duplex mode or if link aggregation is enabled on the port. Used for 802.1w configurations.
broadcast	Specifies a port attached to a LAN segment with more than two bridges. Used for 802.1D configurations. A port with broadcast link type cannot participate in rapid reconfiguration using RSTP or *MSTP*. By default, all STP.1D ports are broadcast links.
point-to-point	Specifies a port attached to a LAN segment with only two bridges. A port with point-to-point link type can participate in rapid reconfiguration. Used for 802.1w and MSTP configurations. By default, all 802.1w and MSTP ports are point-to-point link types.
port_list	Specifies one or more ports or slots and ports.
edge	Specifies a port that does not have a bridge attached. An edge port is placed and held in the *STP* forwarding state unless a BPDU is received by the port. Used for 802.1w and MSTP configurations.
edge-safeguard	Specifies that the edge port be configured with edge safeguard, a loop prevention and detection mechanism. Used for 802.1w and MSTP configurations.
enable	Specifies that edge safeguard be enabled on the edge port(s).
disable	Specifies that edge safeguard be disabled on the edge port(s).
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

STP.1D ports are broadcast link types 802.1w and MSTP ports are auto link types.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

The default, broadcast links, supports legacy STP (802.1D) configurations. If the switch operates in 802.1D mode, any configured port link type will behave the same as the broadcast link type.

RSTP rapidly moves the designated ports of a point-to-point link type into the forwarding state. This behavior is supported by RSTP and MSTP only.

In an MSTP environment, configure the same link types for the CIST and all MSTIs.

Auto Link Type

An auto link behaves like a point-to-point link if the link is in full duplex mode or if link aggregation is enabled on the port; otherwise, an auto link behaves like a broadcast link. If a non-STP switch exists between several switches operating in 802.1w mode with auto links, the non-STP switch may negotiate full-duplex even though the broadcast domain extends over several STP devices.

Edge Link Type

RSTP does not send any BPDUs from an edge port nor does it generate topology change events when an edge port changes its state.

If you configure a port to be an edge port, the port immediately enters the forwarding state. Edge ports remain in the forwarding state unless the port receives a BPDU. In that case, edge ports enter the blocking state. The edge port remains in the blocking state until it stops receiving BPDUs and the message age timer expires.

Edge Safeguard

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. You configure edge safeguard on RSTP or MSTP edge ports to prevent accidental or deliberate misconfigurations (loops) resulting from connecting two edge ports together or by connecting a hub or other non-STP switch to an edge port. Edge safeguard also limits the impact of broadcast storms that might occur on edge ports.

An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs. This advanced loop prevention mechanism improves network resiliency but does not interfere with the rapid convergence of edge ports.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the `configure stpd` *`stpd_name`* `ports bpdu-restrict disable`*`port_list`* command.

If edge safeguard is disabled, BPDU restrict is also disabled.

To configure a port as an edge port and enable edge safeguard on that port, use the `configure stpd` *`stpd_name`* `ports link-type edge`*`port_list`* `edge-safeguard` command and specify enable.

To disable edge safeguard on the edge port, use the `configure stpd` *`stpd_name`* `ports link-type edge`*`port_list`* `edge-safeguard` command and specify disable.

Two other commands are also available to enable and disable edge safeguard:

`configure stpd ports edge-safeguard enable`

`configure stpd ports edge-safeguard disable`

In MSTP, configuring edge safeguard at CIST will be inherited in all *MSTI*.

Example

The following command configures slot 2, ports 1 through 4 to be point-to-point links in STPD s1:

```
configure stpd s1 ports link-type point-to-point 2:1-2:4
```

The following command enables edge safeguard on the RSTP edge port on slot 2, port 3 in STPD s1 configured for RSTP:

```
configure stpd s1 ports link-type edge 2:3 edge-safeguard enable
```

History

This command was first available in ExtremeXOS 10.1.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports loop-protect

`configure stpd` *`stpd_name`* **`ports loop-protect`** [**`on`** | **`off`**] *`port_list`*

Description

Enables and disables loop protect on a port.

Syntax Description

`stpd_name`	Specifies an *STPD* name on the switch.
`on`	Enables loop protect on the specified port.

off	Disables loop protect on the specified port.
port_list	Specifies one or more ports or slots and ports.

Default

By default, loop protect is **off**.

Usage Guidelines

Loop protect prevents loops due to misconfiguration or one-way communication failures.

Example

The following example enables loop protect on port 1:10 in the *STP* domain r1:

```
configure stpd r1 ports loop-protect on 1:10
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports loop-protect partner

```
configure stpd stpd_name ports loop-protect partner [capable |
   incapable] port_list
```

Description

Configures whether the link partner is capable of the loop protect feature.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
capable	The link partner supports the loop protect feature.
incapable	The link partner does not support the loop protect feature.
port_list	Specifies one or more ports or slots and ports.

Default

By default, this command is set to **incapable**.

Usage Guidelines

Ports work in two loop protect operational modes:

- If the port is set to **capable**, the port works in full mode.
- If the port is set to **incapable**, the port works limited mode.

In full mode, when RSTP/*MSTP* BPDUs are received on a point-to-point link and the port is designated, a loop protect timer is set to three times the hello time. When this timer expires, the port is moved to the blocking state. Limited mode adds the requirement that the **flags** field in the BPDU indicates a root role.

Example

The following example configures loop protect partner capability to "capable" for port 1:10 in the *STP* domain r1:

```
configure stpd r1 ports loop-protect partner capable 1:10
```

History

This command was first available in ExtremeXOS 15.7.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports mode

```
configure stpd stpd_name ports mode [dot1d | emistp | pvst-plus]
   port_list
```

Description

Configures the encapsulation mode for the specified port list.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
dot1d	Specifies the *STP* encapsulation mode of operation to be 802.1d.
emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.
port_list	Specifies one or more ports or slots and ports.

Default

Ports in the default STPD (s0) and user-created STPDs are dot1d mode.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

Example

The following command configures STPD s1 with PVST+ packet formatting for slot 2, port 1:

```
configure stpd s1 ports mode pvst-plus 2:1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports port-priority

`configure stpd` *`stpd_name`* **`ports port-priority`** *`priority port_list`*

Description

Specifies the port priority of the port in the specified *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies a numerical port priority value. The range is 0 through 240 and is subject to the multiple of 16 restriction.
port_list	Specifies one or more ports or slots and ports.

Default

The default is 128.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any *STP* parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

By changing the priority of the port, you can make it more or less likely to become the root port or a designated port.

To preserve backward compatibility and to use ExtremeXOS 11.5 or earlier configurations, the existing `configure stpd ports priority` command is available in ExtremeXOS 11.6. If you have an ExtremeXOS 11.5 or earlier configuration, the switch interprets the port priority based on the 802.1D-1998 standard. If the switch reads a value that is not supported in ExtremeXOS 11.6, the switch rejects the entry. For example, if the switch reads the configure stpd ports priority 16 command from an ExtremeXOS 11.5 or earlier configuration, (which is equivalent to the command configure stpd ports priority 8 entered through CLI), the switch saves the value in the new ExtremeXOS 11.6 configuration as configure stpd ports port-priority 128.

A setting of 0 indicates the highest priority.

The range for the priority parameter is 0 through 240 and is subject to the multiple of 16 restriction.

Example

The following command assigns a priority of 32 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports port-priority 32 2:1-2:5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports priority

```
configure stpd stpd_name ports priority priority port_list
```

Description

Specifies the port priority of the port in the specified *STPD*.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies a numerical port priority value. The range is 0 through 31 for *STP* and 0 through 15 for *MSTP* and RSTP.
port_list	Specifies one or more ports or slots and ports.

Default

The default is 128.

Usage Guidelines

If your STPD has the same name as another component, for example a *VLAN*, we recommend that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

By changing the priority of the port, you can make it more or less likely to become the root port or a designated port.

To preserve backward compatibility and to use ExtremeXOS 11.5 or earlier configurations, the existing `configure stpd ports priority` command is available in ExtremeXOS 11.6. If you have an ExtremeXOS 11.5 or earlier configuration, the switch interprets the port priority based on the 802.1D-1998 standard. If the switch reads a value that is not supported in ExtremeXOS 11.6, the switch rejects the entry.

A setting of 0 indicates the highest priority.

The range for the priority parameter is 0 through 31 for STP and 0 through 15 for MSTP and RSTP.

ExtremeXOS 11.6 introduces support for a new ports priority command: `configure stpd ports port-priority`. When you save the port priority value in an ExtremeXOS 11.6 configuration, the switch saves it as the new command `configure stpd ports port-priority` with the corresponding change in priority values. The priority range of this command is 0 through 240 and is subject to the multiple of 16 restriction. For more information see `configure stpd ports port-priority`.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the default value for the priority range are different than switches running ExtremeXOS 11.6.

The range for the priority parameter is 0 through 31.

The default is 16.

Example

The following command assigns a priority of 1 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports priority 1 2:1-2:5
```

History

This command was first available in ExtremeXOS 10.1.

The priority range and behavior was updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports reflection-bpdu

configure **stpd** *stpd_name* **ports reflection-bpdu** [**on** | **off**] *port_list*

Description

Turns on/off reflection Bridge Protocol Data Unit (BPDU) behavior.

Syntax Description

stpd	Spanning Tree Protocol (STP) domain.
stpd_name	Specifies the STP domain name
ports	Ports in this STP domain to configure.
reflection-bpdu	Copy contents (bridge ID, root ID, etc.) of received RSTP/MSTP proposal BPDU in transmitted agreement BPDU. Default is on.
on	Use received bridge ID, etc. in agreement RSTP/MSTP BPDU (not necessary for OUIs 00:01:F4, 00:11:88, 00:1F:45, 20:B3:99).
off	Use local bridge ID, etc. in transmitted agreement RSTP/MSTP BPDU for compatibility with EOS switches with unknown OUIs.
port_list	Specifies the ports in this STP domain to configure.

Default

Reflection BPDU behavior is on by default.

Usage Guidelines

For Rapid Spanning Tree Protocol (RSTP) proposal handshake to work with CISCO switches, the switch that receives the proposal BPDU reflects back the same BPDU (all the contents) with an agreement flag set. This ensures that the other port is acknowledging the proposal that the switch has send out, so the acknowledgment BPDU contains the same contents of the other switch's proposal BPDU with the agreement bit set, instead of the proposal bit.

However, this behavior when used with EOS upstream bridges receiving the agreement BPDU (whose MAC OUI is different than 00:01:F4, 00:11:88, 00:1F:45, 20:B3:99) causes the switch to believe it is being sent its own BPDU, thus causing a multisource event during a topology change. This command allows you turn off the BPDU reflection behavior to avoid this problem.

Example

To enable reflection BPDU on domain "s1" on port 7:

```
configure s1 ports reflection-bpdu on 7
```

To disable reflection BPDU on domain "s1" ono port 7:

```
configure s1 ports reflection-bpdu off 7
```

History

This command was first available in ExtremeXOS 22.6.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports restricted-role disable

`configure stpd` *`stpd_name`* **`ports restricted-role disable`** *`port_list`*

Description

Disables restricted role on the specified port inside the core network.

Syntax Description

`stpd_name`	Specifies an *STPD* name on the switch.
`port_list`	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

The restricted role is disabled by default. If set, it can cause a lack of spanning tree connectivity. A network administrator enables the restricted role to prevent bridges external to a core region of the network from influencing the spanning tree active topology, possibly because those bridges are not under the full control of the administrator.

Note

Disabling Restricted Role at CIST is inherited by all *MSTI*.

Example

The following command disables restricted role for s1 on port 6:3:

```
configure stpd s1 ports restricted-role disable 6:3
```

History

This command was first available in ExtremeXOS 12.1.

This command was added to RSTP in ExtremeXOS 11.6 and 12.0.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports restricted-role enable

configure stpd *stpd_name* **ports restricted-role enable** *port_list*

Description

Enables restricted role on the specified port inside the core network.

Syntax Description

stpd_name	Specifies an *STPD* name on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Enabling restricted role causes the port not to be selected as a root port even if it has the best spanning tree priority vector. Such a port is selected as an alternate port after the root port has been selected.

The restricted role is disabled by default. If set, it can cause a lack of spanning tree connectivity. A network administrator enables the restricted role to prevent bridges external to a core region of the network from influencing the spanning tree active topology, possibly because those bridges are not under the full control of the administrator.

Note

Restricted role should not be enabled with edge mode.

Enabling Restricted Role at CIST is inherited by all *MSTI*.

Example

The following command enables restricted role on port 6:3:

```
configure stpd s1 ports restricted-role enable 6:3
```

History

This command was first available in ExtremeXOS 12.1.

This command was added to RSTP in ExtremeXOS 11.6 and 12.0.3.

Platform Availability

This command is available on ExtremeSwitching 5320, 5420, 5520, and 5720 series switches.

configure stpd ports restricted-tcn

`configure stpd` *`stpd_name`* **`ports restricted-tcn`** [**`on`** | **`off`**] *`port_list`*

Description

Restricts the propagation of Topology Change Notification (TCN) BPDUs on the specified port.
